Port regulations.—All vessels entering the Tagus are obliged to come to anchor off Belem Castle, where there is an office at which they must be entered, their cargoes declared, from whence they come, and whether the cargo be intended to be landed in Lisbon or not; if not, the master applies for "*franquia*," that is, for

leave to remain 8 days in the port for the purpose of disposing of the cargo or of departing with it. Two custom-house officers are then sent on board, and if the cargo is to be discharged at Lisbon, the vessel proceeds to the custom-house, when the master makes entry, delivering the manifest and bills of lading attached to the certificate of the Portuguese consul, at the port of lading, in order to identify the cargo. The officers put on board at Belem are then relieved by two others, who remain until the vessel be discharged and visited by the custom-house searcher. The port dues have to be paid in different offices; but the vessel is not subject to any other charges.

All goods sent on board for exportation must be accompanied by a permit from the custom-house. When the clearances are obtained, the papers are presented by the master, or the ship's agent, to the authorities at Belem, who deliver the signal the vessel is to hoist when going to sea.

There is no regular warehousing and bonding system at Lisbon. All imported dry goods are allowed to remain in the custom-house stores 2 years, and liquids 6 months, without being charged warehouse rent, provided they are intended for consumption, and pay the duties accordingly. But if, after that period, they are then taken out to be exported, they are charged 2 per cent. duty.

Port Charges.—On a foreign ship of 800 tons entering the port of Lisbon, with a general or mixed cargo, and clearing out with the same:

Royal passport.....	Rees.	7,200
Petty expenses on entering at the		
Custom house, about.....	700	
Anchorage.....	500	
Ballast clearance.....	400	
Tonnage, 100 rees per ton.....	30,000	
Lights, 60 rees per ton.....	18,000	
Contribution to board of trade.....	1,500	
Petty charges.....	750	
Bill of health.....	240	
Total.....	56,260=£11	6s. 0d.

Vessels coming with a cargo, or in ballast, and departing in ballast, pay 200 rees per ton lights, or 4 times as much as if they sailed with cargoes. Vessels coming with a cargo, and sailing with the same cargo, pay no tonnage duty.

Commission.—The ordinary rates of commission are, on the sale of goods, $2\frac{1}{2}$ per cent.; *del credere*, $2\frac{1}{2}$ per cent.; on the value of goods landed from a vessel putting in to effect repairs, 1 per cent.; on ship's disbursements, 5 per cent.

Insurances are effected to a trifling amount. There is one national company for effecting insurances; but it enjoys little credit.

Tares are not regulated by any certain rule. Those allowed are generally those invoiced or marked on the package. See *Annuaire du Commerce Maritime*, p. 290; KELLY's *Cambist*; CONSULS' *Answers to Circular Queries*, etc.

Litharge (Ger. *Glätte*, *Glätte*; Du. *Gelit*; Fr. *Litharge*; It. *Lithargio*; Sp. *Almarraga*, *Litharjio*; Rus. *Glet*; Lat. *Lithargyrium*), an oxyd of lead in an imperfect state of vitrification. Most of the lead met with in commerce contains silver, from a few grains to 20 ounces or more in the fodder: when the quantity is sufficient to pay the expense of separation, it is *refined*; that is, the metal is exposed to a high heat, passing at the same time a current of air over the surface: the lead is thus oxydised and converted into *litharge*, while the silver, remaining unchanged, is collected at the end of the process.—THOMSON'S *Chemistry*. Litharge is used for various purposes in the arts, by potters, glass makers, painters, etc.

Litre. The French standard measure of capacity in the decimal system. The litre is a cubic decimetre; that is, a cube, each of the sides of which are 3.937 English inches: it contains 61.028 English cubic inches, and is, therefore, rather less than our quart.

Four and a half litres are a close approach to the English imperial gallon.

Live Oak. Under acts of Congress, the President of the United States is authorized to take measures for the protection of the live oak timber growing on lands owned by the United States in Florida and elsewhere. Persons cutting or removing live oak, or red cedar, and other timber belonging to the United States (without authority), are subject to imprisonment for twelve months and to a fine: the vessels engaged in such unlawful removal are subject to forfeiture, and the captain to a fine of \$1000. (Act of 1881.) See OAK.

Liverpool, a borough of England, in Lancashire, and one of the greatest commercial towns in the world, is situate on the Mersey, along which it extends for nearly six miles. For five miles of this distance a line or chain of docks runs parallel with the river, and from these docks, at intervals, streets extend at right angles, tolerably direct, to the extremity of the boundary. These are crossed by streets more or less parallel to the river; but as the town grew up rather suddenly, no great attention was paid to regularity. The boundary line, from where it touches the river at the south, to its termination at Bootle Bay, embraces a circle of about eight miles. As yet the extremities are imperfectly filled up, but in some places the houses extend beyond the line.

History.—Local archaeologists have been eager to invest the town with the dignity of a remote antiquity; but their labors have not been very successful. In *Doomsday Book* the name does not appear, although sites within its present boundary are mentioned. Mr. Picton, in his admirable paper on "Ancient Liverpool," contends that the place mentioned as *Smedone* must have represented Liverpool, and that *Smedone* is identical with Smithdown, now one of the southern streets. This, however, is not likely, for Smithdown was remote from ancient Liverpool, and on the south side of the Pool, then called Mersey Sea. The name has been a subject of unsatisfying contention; for although the final syllable *pool* is derived from the locality, *liver* is of doubtful origin. In early times the town was called indifferently *Lirpool*, *Litherpool*, *Lithpool*, and *Liferpole*. *F* and *v* were commutable; but, in the most ancient records, the name is written indifferently *Lithepol* and *Lithepole*. Mr. Baines, in his *History of Liverpool*, is disposed to think that *lithe* must be accepted for sea, and thus the derivation will be the pool on the sea. Originally the place was only a small fishing village; for the Mersey, up to a very recent period, was remarkable for its supply of salmon and other fish. The first authentic record of the town is found in a charter of Henry II., in the year 1173, declaring that the estuary of "the Mersey shall be for ever a port endowed with all the liberties belonging to a port of the sea, and that the men of Lyrpul, near to Toxteth, may come and go from each side of the sea with their ships and merchandise free and without obstruction." It is supposed that his majesty in this charter had reference to the conquest of Ireland; for, not content with the bestowal of a barren privilege, he actually erected dwellings called burghage houses, the tenants of which were the primitive freemen of Liverpool. These houses continued to yield a rental to the crown up to the time of Elizabeth, and constituted, to a great extent, the dwellings of the inhabitants. In 1207 King John granted the town a charter, as follows: "Know ye, that we have granted to all our faithful subjects who have taken burghage houses at Liverpool, that they may have all the liberties and free customs in the town of Liverpool which any other free borough upon the sea has in our territories. And, therefore, we command you, that, securely and in our peace, you may come thither to receive and dwell in our burghage houses; in witness whereof, we transmit to you these our letters patent. Witness—Simon de

Pateshill, at Winchester, the 28th day of August, in the 9th year of our reign."

The first palpable step in advance taken by the town was in the reign of Charles II. A new world had then been opened to the enterprise of the old; and Liverpool invited to its port such trade as was created by the infant manufactures of Lancashire, Yorkshire, and Cheshire. As the plantations in America increased, so did the trade of Liverpool; and from an early period her merchants took a prominent part in the slave-trade. She sent out ships to Africa, conveyed their live burdens to America and the West Indies, and in return brought back to the Mersey the sugar, tobacco, and other produce of those regions. The English merchants and ship-owners had competed successfully with the Spaniards and Portuguese; but it was not until 1708 that the first slavers was despatched from the Mersey. Having entered on the trade, they soon participated largely in it; for, in 1752, 101 Liverpool merchants were engaged in the slave traffic, 135 appertaining to London, and 157 to Bristol. The number of Liverpool vessels engaged in the American and West India trade was 106, and of these 88 were slavers. In due time this trade greatly increased; and that it enriched Liverpool may be inferred from the fact that the greater portion of the West Indies belonged to merchants of this place. This trade, however, like every other, was affected by war. It almost ceased during the French war of the 18th century, and the merchant ships unemployed were eagerly converted into privateers. At first the gain was immense; but subsequently the French predominated, and Liverpool suffered severely by the privateers of the enemy. On the return of peace trade was resumed, but not with any accelerated force until the inventions of Arkwright and others created the cotton trade in Lancashire. The war of American Independence had the worst possible effect on the prosperity of Liverpool; and the late war of the French Revolution at first operated most adversely. Still, two circumstances obviated these bad effects. The great increase of population and trade in the United States of America created a demand for British manufactures, and these manufactures had nearly all to pass from the Mersey, which received in return the raw produce indirectly paid for them. At the close of the war Liverpool was still advancing, but not so rapidly as within the last 25 years. The population of the old borough in 1801 was 77,000; in 1811, 94,000; in 1821, 118,000; in 1831, 203,000; in 1841, in the new borough, 286,000; and in 1851, 376,000. The usual rate of increase from 1851 to 1857 will have augmented the population to more than 400,000, and latterly it has gone on in accelerated ratio. Proof of this is derived from the fact, that the number of new houses erected in 1855 was 1355, while in 1856 it was 1703.

Trade of the Port.—In 1750 Liverpool had only 20 sailing vessels engaged in the continental trade; now she has treble that number, and fleets of screw steamers, which constantly visit every port in the Mediterranean, and render the Mersey a medium of communication between France, Holland, Belgium, and America. The East Indies, too, have been opened to Liverpool enterprise. Since the alteration in the Company's charter, and in the amount of business done in the East, Liverpool stands next to London. Another trade she has almost monopolized—the Australian trade. Her clipper vessels are admitted to be the finest in the world, and, in consequence, the emigration to the antipodes is the largest from this port, and the return cargoes the heaviest; for necessarily the freights are low, as more goods go than come, and cheapness induces shippers to send their wool here rather than to London, although London is the principal market. But Liverpool is now creating a wool market of her own. The first authentic account of the number of vessels entering the port dates from

1577; and the following returns indicate at a glance the progress of the trade:

Years.	Vessels.	Tonnage.	Dock duties.
1757.....	1,371	£2,386
1780.....	2,261	8,523
1800.....	4,746	450,000	28,379
1820*.....	7,277	805,033	94,412
1830.....	11,214	1,411,964	151,359
1840.....	15,998	2,445,708	178,196
1850.....	20,457	8,586,837	211,743
1856.....	20,586	4,320,618	326,801

* This is the first year when goods were rated as well as ships.

The custom-house revenue collected in the port was, in 1855, £3,576,344, 2s. 8d., and 1856, £3,824,177, 14s. 8d., showing an increase of £247,843, 12s. The last quarter of 1856 exhibits a comparatively further increase of £118,581 over the corresponding quarter of 1855. The town dues now produce more than £120,000 a year, and there is another impost called light-dues, which produced in 1856 £99,965, against £86,182 in 1855. These light-dues go altogether to the Board of Trade, and are disposed of as passing tolls. The greater number of vessels frequenting the port comes from the United States of America; for the great trade of Liverpool is in cotton, and the cotton supplied comes in largest quantities from the southern States of the Union. The following returns will give a correct idea of the progress of this trade. "In 1770 there were imported into Liverpool 6037 bags 3 bales 3 barrels of raw cotton; but since the improvements of Hargreaves and Arkwright in spinning, the trade has greatly increased. Thus the importation was, in

	Pounds.		Pounds.
1780.....	6,766,613	1830.....	261,961,452
1800.....	56,010,732	1840.....	583,400,000
1820.....	143,672,655	1850.....	685,600,000

In 1856 there were imported into Liverpool 2,028,850 bales of cotton. A large trade is carried on in flour, grain, and corn. The imports of these in 1856 were:

Wheat.....	qrs. 1,370,152	Flour....	sacks 282,704
Corn.....	" 897,407	"	" barrels 1,188,260

Two thirds of all this came from the United States. The quantity re-exported is small. The total sugar imported in 1856 was 76,000 tons, of which 17,840 tons were from the British West India plantations, 18,555 from Bengal, and 19,996 from Brazil.

Docks.—For carrying on a trade so large great facilities are afforded. In 1715 the first dock was constructed with an area of 3½ acres. This sufficed for 42 years; but, at an interval of 18 years, another dock appeared, and within a period of 50 years five additional docks were made. In 1826 the corporation filled up the primitive dock in order to erect the custom-house on its site. In consequence of this proceeding, and the rapid increase of buildings, none of the docks run inland, but all extend along and parallel with the river. From 1830 to 1842, eight new docks were opened; and from 1845 to 1852, not less than 14 docks and basins have been added. The total water space afforded by the docks is 200 acres; and the quays measure 14 miles in length. The river wall is 5 miles 200 yards long; the total area of the dock estate is 712 acres. No other port can present any thing to be compared with the Liverpool Docks. One serious inconvenience, however, is, that running along the river wall, they interrupt the approaches to the ferries, and when the gates are open, stop intercourse for a short time altogether. To remedy this, an immense landing stage, constructed by Mr. Cubitt, has been placed at St. George's Pier, and this has not only promoted the comfort of passengers, but served as a very popular promenade. Another landing-stage has been constructed, three times the size of the former one, at a cost of £150,000. Means, too, are under consideration for facilitating approach to the ferries. Until 1826 there were few warehouses on the dock quays. The warehouses are in general up the town, or at some dis-

tance from the quays. The inconvenience of this provoked a lively agitation among the merchants, and, through the great exertion of several members of the council, the Albert Dock was constructed and surrounded, like St. Katherine's Dock, London, by piles of ponderous warehouses. Stanley Dock has since also been surrounded by warehouses, and the new Wapping Docks are to have the same advantage. Extensive as the dock accommodation is, it is no longer adequate to the wants of the port. Several new docks are projected at the north end, on land reclaimed from the bay, under a certain understanding with the Earl of Derby; and in 1854 the corporation became purchasers of the Birkenhead Dock and estates for a sum of £1,143,000. But these docks, to be rendered available, will require a further outlay of £800,000. The constitution of the dock management has undergone some changes. The corporation having been the first projectors and supporters of the docks, were recognized as trustees of the estate. Under the act 51st George III. the committee consisted of 21 persons, all members of and appointed by the common council, and this continued until the passing of the act 6th George IV., 1825, when the dock rate-payers were first directly represented by returning 8 members to the committee; the council electing 13, including the chairman, and the council having a veto on the proceedings. This continued until the act of 1851, by which a committee of 24 is appointed—12 by the council and 12 by the dock rate-payers. The committee appoint their own chairman and deputy-chairman; the chairman being, however, one of the 12 members elected by the council. The council have also a veto on the proceedings of the committee by a majority of two thirds. The care of the port is divided between the dock committee and the corporation. The latter constructed the light-house and built the Wallasey embankment, to prevent the sea encroaching on the district and impairing the channels leading to the river; and the former provide buoys, and a marine surveyor whose duty it is to note the shifting of the sandbanks, and give notice to the pilots and mariners.

Ship-building.—There are several eminent ship-builders in Liverpool, but of late the greater part of the trade has been in repairing and in the building of iron ships. There are five building-yards on the Lancashire side of the river, and three on the other side. Those on the Cheshire side combine graving with building docks, and, although there are several graving docks on the Liverpool side, they are found to be inadequate to the wants of the port. As might be expected, a large trade is carried on in ships. In 1856, 694 ships, of 828,991 tons were sold, and of these one fifth were bought by foreigners. Liverpool is a place of trade rather than of manufactures, and those manufactures which exist are more for the supply of local wants than for general purposes. An attempt was made to establish a cotton manufactory, but without success.

Next to London, the corporation of Liverpool is decidedly the richest in the kingdom. At first her income was miserably small, and centuries passed without improving it; but in 1777 the corporation purchased from Lord Molyneux, for £2250, his reversion, expectant on the determination of his lease in the town dues, and these rose gradually from £20,000 a year to £120,000. The income of the corporation is also derived from land within the town, from markets, and from police rates—the whole estimated at £268,000 for 1857. The claim to the town dues has often been questioned. A case was tried in the Court of King's Bench in 1831, and decided in favor of the corporation; but in 1856 government brought in a bill to abolish them. Great resistance being offered, a select committee was appointed; it heard evidence, but made no report. The people of Manchester are opposed to

these dues, and it is believed that ultimately there must be a compromise. The dues consist of small sums, hardly appreciable in amount, collected on merchandise. The dock-rates belong to no special interest, being devoted not to demands, but simply to interest of money borrowed, and the cost of working.

With the increase of trade and wealth, the mode of doing business underwent a great change. At the beginning of the present century the merchant had his counting-house and warehouse behind his dwelling-house. These mansions may now be seen in Hanover-street, Duke-street, Seel-street, and others, bearing still, in their architecture, evidence of cost and taste, although now mostly devoted to meaner uses. 80 years later the mercantile offices began to gather about the Exchange; mean buildings were transformed into lordly edifices; and as much as £600 or £800 a year is now (1857) paid for a suite of rooms on a single floor. Such rents are, of course, temptations to an increase of buildings; and in 1856 as much as £47 a square yard has been paid for building-land near the Town-hall. All the opulent classes live in the environs. Up to the year 1833 New Brighton was a sand-hill, without a single tenement on it; now it is covered with villas. The villas cover the hills and crowd the gorges, which extend from the Red Noses to Rock Ferry; while on the Lancashire side, Aigburth, Allerton, Woolton, Wavertree, Old Swan, Knotty Ash, West Derby, Walton, Crosby, Litherland, Waterloo, and Bootle, have been entirely occupied by the mansions and villas of the opulent people of Liverpool.

The mercantile offices which have sprung up around the Exchange are remarkable for their architectural beauty, as well as for their convenience. Water-street, from the Town-hall to George's Dock, presents a succession of such buildings. On the site of the old tower, the last remnant of the Castle, have been erected the Tower Buildings—a mass of counting-houses, ornamented toward the river by an Italian tower, now used as a semaphore telegraph station. Fenwick-street, at right angles with Water-street, presents a succession of buildings equally beautiful. The Corn Exchange is in Brunswick-street; and in the same street is the Union Bank, a perfect architectural *bijou*; and a little further on, in James-street, at the top of Fenwick-street, is the North and South Wales Bank, equally entitled to notice. In Castle-street stands the Branch Bank of England, constructed by Mr. Cockerell; and in the same street the Commercial Bank Buildings, erected after Mr. Cunningham's design. North John-street, which runs parallel with Castle-street, is entirely devoted to offices; and in Dale-street are situated the Royal Bank Buildings, remarkable for boldness of design. The Custom-house, which stands at the foot of South-street, was built after a design of John Foster, at the cost of £283,804. The estimate was £175,000; and although the building is an imposing one in appearance, it is regarded as not fully answering its purposes. In front of it is a bronze statue of Huskisson, by Gibson. Part of the custom-house is used as a dock-office, and another part of it as the post-office; for neither of which is the building particularly suitable. To the east of the custom-house is the Sailors' Home, which is admirably adapted to the intended object of the Marine Board, and for a sailors' dépôt.—E. B.

Breakwater for Liverpool.—Mr. George Rennie, C. E., has projected for the port and harbor of Liverpool a jetty or breakwater, from the Black Rock Point, at the entrance of the Mersey, on the Cheshire shore, in a line nearly parallel to the Lancashire shore. The breakwater will take a north-westerly direction and curve outward toward the Victoria Channel, across the Brazil and Burbo Banks, for a distance of upward of three miles, when it will be ended by a light-house. Simultaneously with the construction of a breakwater, it is proposed to continue the line of quay wall of the

north docks, in a direction curving inward as far as Formby Point, so as to assimilate the form of the entrance into the Mersey to a trumpet's mouth. The advantages proposed by this plan are said to be: 1. The general improvement of the entrance into the harbor, by which the flow and ebb of the tides will be more regular and more favorable to the deepening and preserving the low water channels, and to their navigation generally. 2. The protection of the north docks (occasionally inaccessible in stormy weather), and of the Bootle and Formby shores from the violent effects of the prevailing winds. 3. The acquisition of nearly 2000 acres of valuable land, which will be inclosed between the new wall and that shore. 4. The valuable conversion of from 30,000 to 40,000 acres of sand-banks now rapidly accumulating and rising above low water, along the whole shore in front of the Lea-

sowes, from the Rock Point to the entrance of the Dee estuary at Hilbre Point. 5. The prevention from entering into the harbor of vast quantities of drift sand which come from the North Burbo banks, in south-westerly gales. 6. The prevention of many shipwrecks and loss of lives and property which occur annually. 7. The reduction to a minimum of the great expenses now incurred in maintaining the lights, buoys, steam-tugs, dredgers, etc., now employed in preserving the direction and depth of the sea channels, and which heavily tax the 40,000 ships and 4,000,000 of tons carried by them annually. Finally, the preservation and improvement of the port and harbor of Liverpool, and which, like its neighbor, the estuary of the Dee, will be entirely ruined if prompt measures be not taken to prevent it. The following table shows the grain trade of Liverpool:

For a full exhibit of the commerce of Great Britain, including a statement of that of Liverpool, see articles GREAT BRITAIN AND ENGLAND.

Livre. From about the year 800, in the reign of Charlemagne, to the year 1103, in that of Philip I., the French *livre*, or money unit, contained exactly a pound weight of twelve ounces (*poids de marc*) of pure silver. It was divided into 20 sols, each of which, of course, weighed 1-20th part of a pound. This ancient standard was first violated by Philip I., who diminished considerably the quantity of pure silver contained in the sols. The example, once set, was so well followed up, that in 1180 the *livre* was reduced to less than a fourth part of its original weight of pure silver. In almost every succeeding reign there was a fresh diminution. "La Monnoye," says Lé Blanc, "qui est la plus précieuse et la plus importante des mesures, a changé en France presque aussi souvent que nos habits ont changé de mode." And to such an extent had the process of degradation been carried, that, at the epoch of the Revolution, the *livre* did not contain

a seventy-eighth part of the silver contained in the *livre* of Charlemagne. It would then have required 7885 *livres* really to extinguish a debt of 100 *livres* contracted in the ninth or tenth century; and an individual who, in that remote period, had an annual income of 1000 *livres*, was as rich, in respect to money, as those who, at the Revolution, enjoyed a revenue of 78,850 *livres*. (PAUCOT, *Traité des Mesures, Poids, etc.*, p. 693.) It was not to be expected that degradations originating in the necessities, the ignorance, and the rapacity of a long series of arbitrary princes, should be made according to any fixed principle. They were sometimes the result of an increase in the denomination of the coins, but more frequently of a diminution of the purity of the metal of which they were struck. A degradation of this kind was not so easily detected; and, in order to render its discovery still more difficult, Philip of Valois, John, and some other kings, obliged the officers of the mint to swear to conceal the fraud, and to endeavor to make the merchants believe that the coins were of full value. (LÉ BLANC, p. 212.)

Sometimes one species of money was reduced, without any alteration being made in the others. No sooner, however, had the people, in their dealings, manifested a preference, as they uniformly did, for the money which had not been reduced, than its circulation was forbidden, or its value brought down to the same level with the rest. By an enactment of Congress, the commercial value, in the United States, of a livre tournois of France, is fixed at 18½ cents.

Lloyd's, a number of rooms in the Royal Exchange of London, frequented by underwriters, merchants, ship-owners, ship and insurance brokers, and others, chiefly for the purpose of obtaining shipping intelligence, and of transacting business connected with marine insurance. The principal room is that of the Underwriters, in which two enormous ledgers lie constantly open, the one containing notices of *speaking*, or ships spoken with, and arrivals of vessels at their various destinations; the other recording disasters at sea. All intelligence is entered immediately upon its reception, without removing the ledgers from their places, in order that they may at any moment be inspected by those interested in their contents. At the inner end of the room is an ingenious piece of mechanism, by means of which the indications of an anemometer and an anemoscope are inscribed every hour in the 24, by a couple of pencils, upon a sheet of white paper. The advantage to the underwriter, in the conduct of his business, of this information respecting the force and the direction of the wind, can scarcely be over-estimated. The underwriters are persons who, for a premium, grant an indemnity to merchants against risks by sea; and they are so called from the custom of *writing* their names *under*, or at the foot of the policies of insurance. The method of *effecting* an insurance at Lloyd's is the following: When a broker receives an order to insure interest to a certain amount in a particular ship, he writes upon a slip of paper the name of the vessel, the master's name, the nature of the voyage, the subject to be insured, and its value, and any other information which the circumstances of the case may require. He then offers the risk to different underwriters until the value of the interest to be insured is exhausted, each underwriter subscribing his name opposite to the amount he engages to insure, and all agreeing to accept a uniform premium. The insurance is now virtually effected; the stamped policy being afterward extended from this slip. This distribution of the risk among many individuals is, of course, very conducive both to the solvency of the underwriter and to the security of the insured. The number of underwriters is under 200; but some idea of the immense amount of insurance business done at Lloyd's may be derived from the fact, that the value of the interest annually insured at the present is estimated at about £40,000,000. No person is permitted to transact business at Lloyd's as an underwriter or insurance broker until he shall have been duly admitted as a member, and shall have paid an entrance fee. Communicating with the Underwriters' Room is the Chart Room. Here a valuable collection of charts, and shipping intelligence as originally received, are carefully arranged, so as to be at all times easy of access. In this room also lie, for the use of members, four ledgers, in which the names of ships are arranged in alphabetical order, each name having under it all the information possessed regarding the vessel. The Merchants' Room is a place of resort for general news; it is, in fact, a news or reading-room. The Captains' Room is employed as an auction-room for sales of ships, etc. Every person who enjoys the privilege of frequenting Lloyd's pays a fixed annual subscription.

The shipping intelligence received at Lloyd's is furnished by agents, who are appointed for the purpose; and as there is scarcely a port of any consequence where one is not resident, their number is very large.

The information which each transmits to headquarters is regular, accurate, and complete. It is furnished by means of *letters*, signed by the agents, and by means of the newspapers, and shipping lists which are published at the various ports; the intelligence thus received consisting not only of lists of vessels which had arrived at and which had sailed from the particular ports, together with their accomplished and intended voyages, and of casualties which had occurred at or near the ports, but also of notices of ships spoken with, and of casualties at sea, furnished by vessels. No salary attaches to the office of agent for Lloyd's; the labor involved being amply recompensed by the business which it commands, and by the credit which the appointment confers upon its holder as a person of worth and respectability. The intelligence, besides being made known to the members of Lloyd's by means of the ledgers, of which we have already spoken, is published every afternoon in *Lloyd's List* for diffusion over the country. The management of Lloyd's lies with the subscribers, who select a committee from their number for the purpose, called the "Committee for managing the affairs of Lloyd's." This committee appoints the agents and the officials of the establishment. The expenses connected with the establishment are defrayed by the fees and annual subscriptions.

The designation *Lloyd's* originated with a person of the name of Lloyd, who kept a coffee-house in Abchurch Lane, Lombard-street. From the vicinity of this house to the Old Royal Exchange, it speedily became a rendezvous of merchants for news, and for the transaction of business. It was afterward removed to Pope's Head Alley, and thence again, in 1774, to the Royal Exchange. After the destruction of the Exchange, in 1838, by fire, which originated in Lloyd's, the business was carried on in the South Sea House, in Old Broad-street, where it remained until the opening of the present Royal Exchange, in 1844, when it was finally removed to its present splendid apartments. Similar establishments exist in our principal sea-ports. *Lloyd's Register of British and Foreign Shipping*, a volume published annually, and furnishing information respecting the nature of vessels, their class, place where built, materials, owners, captains, age, repairs, etc. The ships are registered according to the reports of salaried agents, appointed at various ports. The office of this *Register* is in White Lion Court, Cornhill, and is quite distinct from Lloyd's of the Exchange.—E. B.

Loadstone (Ger. *Magnet*; Du. *Magneet*; Fr. *Aimant*; It. *Calamita*; Sp. *Iman*; Rus. *Magnit*; Lat. *Magnes*). M. Haüy observes, that the ores in which the iron contains the least oxygen without being engaged in other combinations, form natural magnets; and he calls the *loadstones* of commerce, which are found in considerable masses in Germany, Sweden, Norway, Spain, Italy, China, Siam, the Philippine Isles, Corsica, and Ethiopia, *oxydulated iron*. The loadstone is characterized by the following properties: A very strong action on the magnetic needle. Specific gravity 4.2457; not ductile; of a dark gray color, with a metallic lustre; primitive form, the regular octahedron; insoluble in nitric acid. This singular substance was known to the ancients; and they had remarked its peculiar property of attracting iron; but it does not appear that they were acquainted with the wonderful property which it also has of turning to the pole when suspended, and left at liberty to move freely. Upon this remarkable circumstance the mariners' compass depends—an instrument which gives us such infinite advantage over the ancients. It is this which enables the mariner to conduct his vessel through vast oceans out of the sight of land, in any given direction; and this directive property also guides the miner in subterranean excavations, and the traveler through deserts otherwise impassable. The natural loadstone

has also the quality of communicating its properties to iron and steel; and when pieces of steel properly prepared are touched, as it is called, by the loadstone, they are denominated artificial magnets. See COMPASS. Its virtues were but indistinctly known to the ancients, yet its attractive quality had been taken notice of from very remote times.—*Sturmius*. Aristotle assures us that Thales made mention of it, and Hippocrates speaks of it under the name of stone that attracts iron; and Pliny was struck with its attractive power. The polar attraction of the loadstone was, it is said, known in France before A. D. 1180; but this honor is accorded to Roger Bacon about 1267. The Italians discovered that it could communicate its virtues to steel or iron; and Flavio Giojo, of Amalfi, was the inventor of the mariners' compass.—*Haydn*.

Loans. Those for the service of the crown of England were generally borrowed at Antwerp until after the reign of Elizabeth. In 1559, the queen borrowed £200,000 of the city of Antwerp, to enable her to reform her own coin, and Sir Thomas Gresham and the city of London joined in the security.—*Rapin*. The amount of the English loans, during four late memorable periods, was, viz.:

Seven years' war, 1755—1768.....	£52,100,000
American war, 1776—1784.....	75,500,000
French Revolutionary war, 1793—1802... ..	168,500,000
War against Bonaparte, 1803—1814.....	206,800,000

Besides the property tax. In 1813 were raised two loans of 21,000,000 and 22,000,000; and it deserves to be recorded, that a subscription loan to carry the war against France was filled up in London in 15 hours and 20 minutes, to the amount of £18,000,000, December 5, 1796.

Lobos, or Seal Islands, two groups of guano islands in the Pacific Ocean, lying off the coast of Peru. The landward and northern group are about 20 miles west of the main land, in S. lat. $6^{\circ} 29'$, W. long. $80^{\circ} 53'$, and consist of one large island, 5 miles long by 2 in breadth, with several rocky islets. The seaward group lie about 38 miles from the main land, in S. lat. $6^{\circ} 56'$, W. long. $80^{\circ} 55'$, and consist of two islands of about the same size, viz., 1 mile long by 1 in breadth, and separated from each other by a narrow channel. Both belong to Peru, although unsuccessful attempts have been made at various times by private companies to obtain possession of them. On the north group there is estimated to be a deposit of guano of about 400,000 tons, and on the other islands of more than 200,000 tons. The only inhabitants are those employed in the shipment of the manure, and consisting chiefly of Indians and Chinese.

Lobster (Fr. *Ecrevisse*; Lat. *Cancer*), a fish of the crab species. The Scilly Islands and the Land's End abound in lobsters, as well as several places on the Scotch shores, particularly about Montrose. But the principal lobster fishery is on the coast of Norway; whence it is believed about 1,000,000 lobsters are annually imported into London. Those of Heligoland are, however, esteemed the best; they are of a deeper black color, and their flesh is firmer than those brought from Norway.

Loch. The Scotch term for lake, which see.

Lock, in Internal Navigation, is a part of a canal included between two floodgates, by means of which a vessel is transferred from a higher to a lower level, or from a lower to a higher.

Lock, Locks (Ger. *Schlösser*; Du. *Sloten*; Fr. *Serrures*; It. *Serrature*; Sp. *Cerraduras*, *Cerrajos*; Rus. *Samki*), a well-known instrument, of which there are infinite varieties. A great deal of art and delicacy is sometimes displayed in contriving and varying the wards, springs, bolts, etc., and adjusting them to the places where they are to be used, and to the occasions of using them. From the various structure of locks, accommodated to their different intentions, they acquire various names, as stock locks, spring locks,

padlocks, etc. The grand difficulty to be overcome in making a lock is to construct it so that it may not be opened by any key except its own, nor admit of being picked; it should also be possessed of sufficient strength and durability, and not be too complex. Many ingenious contrivances have been proposed for the attainment of the desired security—several of which are possessed of considerable merit. Common door-locks are now usually inserted in the wood, instead of being, as formerly, screwed to it; and when so placed are called *mortise* locks.

Locust-tree. The *Robina pseudacacia*, or common locust, from the valuable properties of its wood, and the beauty of its foliage and flowers, ranks among the first trees of the American forests. In favorable situations, it attains a height of 80 or 90 feet, and sometimes exceeds four feet in diameter; but ordinarily, it does not surpass half of these dimensions. On the trunks and large limbs of old trees, the bark is very thick, and deeply furrowed, but on young trees, not more than two or three inches in diameter, it is armed with strong, hooked prickles, which disappear altogether as they grow old; and in some varieties they are wanting even when young.

The common locust naturally abounds in the country west of the Alleghanies, as far as Arkansas. It is also plentiful in the Canadas, but is not found indigenous in the United States east of the river Delaware, nor does it grow spontaneously in the maritime parts of the middle and southern States, within the distance of 50 to 100 miles from the sea. It is planted, however, for purposes of utility and ornament, from Maine to Georgia. It was observed by Michaux, that "the locust forms a much smaller portion of the American forests than the oaks and walnuts, and that it is nowhere found occupying tracts, even of a few acres exclusively." Hence the tree, where it is met with, is often spared by settlers, as being ornamental, and comparatively rare, and old specimens, which formerly belonged to the aboriginal forests, are frequently seen growing in the midst of cultivated fields.

Of all American trees that have been cultivated in Europe there is no one, of which so much has been said and done, as the locust. It was among the first plants that were carried to that country, and it has been more extensively propagated than any other, both in Britain and in France, where it has been alternately extolled and neglected; and even at the present day, though the beauty of its foliage and flowers is universally admired, and the valuable properties have enthusiastically been praised and acknowledged, it is not considered as holding a high rank as a timber-tree, or as being generally planted with a view to profit.

The wood of the locust, which is commonly of a greenish-yellow color, marked with brown veins, is very hard, compact, and susceptible of a brilliant polish. It possesses great strength, with but little elasticity; and its most valuable property is that of resisting decay longer than almost any other species of wood. When newly cut, it weighs 63 pounds 3 ounces to a cubic foot; half dry, 56½ pounds, and when quite dry, only 48½ pounds, or according to others, only 46 pounds. According to M. Hartig, the German dendrologist, its value for fuel, when compared with that of the beech (*Fagus sylvatica*), is as 12 to 15. For duration, he places it next below the oak (*Quercus robur*), and next above the larch (*Larix europæa*), and the Scotch pine (*Pinus sylvestris*). Barlow, in Wither's *Treatise*, gives the strength of locust timber, as compared with other woods, as follows:—Teak (*Tectona grandis*), 2462; Ash (*Fraxinus excelsior*), 2026; Locust (*Robina pseudacacia*), 1867; Oak (*Quercus robur*), 1672; Beech (*Fagus sylvatica*), 1556; Norway spar (*Abies excelsa*), 1474; Riga fir (*Pinus sylvestris rigensis*), 1108; Elm (*Ulmus campestris*), 1013. From some experiments made at Brest, in 1823, the weight of the lo-

cust wood was found to be one sixth heavier than that of the English oak; its strength as 1427 to 820; and its elasticity as 21 to 9. By experiments made in the yard of the royal naval college, at Woolwich, it appears that the lateral strength of the locust timber, in resisting fracture, is greater than that of the British oak, in the proportion of 100 to 75. From all these experiments, however widely they may differ in their results, we may safely conclude, that sound, well-seasoned locust timber "is heavier, harder, stronger, more rigid, more elastic, and tougher than that of the best English oak," and consequently is more suitable for trenails. Michaux remarks that, "if the trunks of the locust-trees grown in the north of Pennsylvania, exceed 15 inches in diameter, when they are cut down and split open, they are frequently found to be decayed at the heart; but that this is not the case with trees that have grown further south," which would tend to show that a poor soil and a cold climate are not sufficient to produce good timber.

There are, at least, three popular varieties of the common locust, distinguishable by the color of the heart-wood, which may be described as follows:

1. *Red Locust*, with the heart red, and is esteemed as far the most beautiful and durable timber. Posts of this variety, perfectly seasoned before they are set in the ground, are estimated to last 40 years; or twice as long as those of the white locust.

2. *Green, or Yellow Locust*.—This is the most common variety, being known by its greenish-yellow heart, and is held next best in quality to the red locust.

3. *White Locust*, with a white heart; and is considered as the least valuable of them all.

All of the above-mentioned variations are supposed to be owing entirely to the soil and situations in which they grow, being caused in a similar manner as the various colors of the flowers of the hydrangea, which depend on the nature of the earth in which they are planted, and even on the color of the water with which they are irrigated.

In naval architecture, the timber of the locust is much esteemed by American shipwrights, and enters, with the live oak, the white oak, and the red cedar, into the upper and the lower parts of the frames of vessels, though in very small proportions. It is considered as durable as the live oak and the red cedar, with the advantage of being lighter than the former and stronger than the latter. It is used for trenails in the dockyards of Europe and the United States, in preference to any other kind of wood; and instead of decaying, it acquires, in time, an extraordinary degree of hardness. In civil architecture, in this country, it enters but little into the composition of houses, on account of its scarcity, and its value in ship-building, and for posts of rural fences, etc. When employed in the construction of houses, it is more particularly applied for the support of the sills, which usually consist of more destructible timber, and which, if they were placed immediately on the ground, would sooner decay. From the hardness of the wood when seasoned, the firmness of the grain, and its lustre when polished, it has been extensively used in cabinet-making, and has been substituted by turners for the box-wood, in many species of light work, such as small domestic wares, toys, etc. It has also been employed by millwrights for cogs, but it is less valuable for this purpose than that of the rock-maple.

The most important use to which the locust is applied in Britain, is that of forming trenails for ship-fastenings; and large quantities are annually imported into that country from America. As long as we can supply them for the prices which they at present bear, it never would repay the grower to cultivate them in England for this special purpose.

In France, the locust has been extensively cultivated in the Gironde, in copses, which are cut at the age of four years, for vine-props; and these props are

said to last more than 20 years. In the same district, old trees are pollarded, and their branches lopped every third year, for the same purpose. In Paris, many small articles are made of the wood; such as salt-cellars, sugar-dishes, spoons, forks, sand-boxes, paper-knives, etc.

In Lombardy, the wood of the locust is used for many rural purposes. Young plants of it were formerly much employed for live fences; but this practice has long since been abandoned, because the tree was found to impoverish the soil; and, with age, lost its prickles; besides, from being continually pruned, to keep it low, or from being cropped by animals, the hedges became thin and open at the bottom, and eventually became mere stumps. Italy, as well as the southern Departments of France, Michaux considers the countries in which the greatest advantages may be derived from the rapid growth of this tree. In good soils, in such climates, at the end of 20 or 25 years, he says that a mass of wood may be obtained from the locust, twice as great as from any other species of tree.

In countries where clover and root crops are not cultivated, the leaves of the locust may serve as a substitute for these articles as provender for animals. When this species is cultivated for this purpose, it should be mown every year; or the trees may be allowed to grow to the height of 8 or 10 feet, and treated as pollards, the branches being cut off every other year, which should be done at mid-summer, when they are succulent, and can be dried for winter's use. In performing this operation, one or two shoots should be left on each tree, to keep up vegetation, which may be pruned off the following winter or spring. When the shoots are to be eaten green, none should be taken but those of the same season; because in them the prickles are herbaceous, and, consequently, do not injure the mouths of the animals.—BROWNE'S *Trees of America*.

Lofoden Islands, a large group of islands off the north-west coast of Norway, stretching north-east to south-west from N. lat. 67° 30' to 69° 30', and E. long. 12° 16' 30'. The group resembles the vertebrae of an animal in form; the islands fitting into each other so closely, that from a distance they seem to form one long continent. The islands, which are all of a granite or limestone formation, are precipitous, and very lofty; the hills of Vaagoe rising almost perpendicularly to a height of 4000 feet above the sea. The channels which separate them are narrow, tortuous, and generally of great depth. The largest islands of the group are in the north, viz., Hindoe, Andoe, and Langoe; the first being separated from the main land by a passage about a mile in width. The tail of the chain is formed of a number of smaller islands, the chief of which are the two Vaagoes, Moskenösoe, Vårøe, and Rost, separated from the main land by West Fiord. This gulf is much dreaded by mariners when the wind is south-west, on account of the great swell which rolls in from the North Sea, and which is especially dangerous at the Mälstroem channel between Vårøe and Moskenösoe. The mean temperature of the group ranges from 23° in winter to 50° in summer, which, considering the high latitude, is comparatively mild. This is caused, however, by the exposure of the group to the Gulf Stream. Large shoals of herring and cod frequent the Lofodens annually, and attract to these islands a large concourse of fishing-boats from several hundreds of miles of sea-coast. In the inclement months of February and March, generally about 3000 boats (mostly open) assemble here for the cod-fishing, each having, on an average, five of a crew, while the aggregate number of fish taken amounts to more than 3,000,000. These are chiefly dried in the sun and wind, without salt, and sent to Tromsø, Trondhjem, Bergen, etc., along with large quantities of cod-liver oil and cod-roe, for exportation or home consumption. The cod-fishery ends in April, and is

followed by the herring-fishing, which is carried on till the boisterous season, at the end of autumn. The permanent population of the Lofodens is very small, considering the extent of territory, and is sustained principally by the fisheries. Some cattle, however, are kept in the most sheltered parts of the island, where good pasturage is obtained in the summer. Steilo, in the island of Ulvo, is the chief village of the group, and has communication with the ports of the main land by means of a steamer, which visits the Lofodens in summer. Estimated population of group, 4000.

Log, an apparatus used to measure the rate of a ship's velocity through the water. For this purpose, there are several inventions, but the one most generally used is the following, called the *common log*. It is a piece of thin board, forming the quadrant of a circle of about 6 inches radius, and balances by a small plate of lead, nailed on the circular part, so as to swim perpendicularly in the water, with the greater part immersed. The log-line is fastened to the log by means of two legs, one of which is knotted, through a hole at one corner, while the other is attached to a pin, fixed in a hole at the other corner so as to draw out occasionally. The log-line being divided into certain spaces, which are in proportion to an equal number of geographical miles, as a half or quarter minute is to an hour of time, is wound about a reel. The whole is employed to measure the ship's head-way in the following manner: the reel being held by one man, and the half-minute glass by another; the mate of the watch fixes the pin, and throws the log over the stern, which, swimming perpendicularly, feels an immediate resistance, and is considered as fixed, the line being slackened over the stern to prevent the pin coming out. The knots are measured from a mark on the line, at the distance of 12 or 15 fathoms from the log. The glass is, therefore, turned the instant the mark passes over the stern; and, as soon as the sand in the glass has run out, the line is stopped. The water, then being on the log, dislodges the pin, so that the board, now presenting only its edge to the water, is easily drawn aboard. The number of knots and fathoms which had run off at the expiration of the glass, determines the ship's velocity. The half-minute glass, and divisions on the line, should be frequently measured, to determine any variation in either of them, and to make allowance accordingly. If the glass runs 30 seconds, the distance between the knots should be 50 feet. When it runs more or less, it should therefore be corrected by the following analogy: as 30 is to 50, so is the number of seconds of the glass to the distance between the knots upon the line. As the heat or moisture of the weather has often a considerable effect on the glass, so as to make it run slower or faster, it should be frequently tried by the vibration of a pendulum. As many accidents attend a ship during a day's sailing, such as the variableness of winds, the different quantity of sail carried, etc., it will be necessary to heave the log at every alteration, and even if no alteration be perceptible, yet it ought to be constantly heaved. The inventor of this simple but valuable device is not known, and no mention of it occurs till the year 1607, in an East India voyage, published by Purchas.—E. A.

Logarithms, so useful in mathematics, are the indexes of the ratio of numbers one to another. They were invented by Baron Merchiston, an eminent Scotchman (Sir John Napier), in 1614. The method of computing by means of marked pieces of ivory, was discovered about the same time, and hence called Napier's lines. The invention was afterward completed by Mr. Briggs, at Oxford.

Log-Board, two boards shutting together like a book, and divided into several columns, containing the hours of the day and night, the direction of the winds and the course of the ship, with all the material

occurrences that happen during the 24 hours, or from noon to noon, together with the latitude by observation. From this table the officers work the ship's way, and compile their journals. The whole being written with chalk, is rubbed out every day at noon.—E. A.

Log-Book, a book into which the contents of the log-board are daily transcribed at noon, together with any circumstances, deserving notice, that may happen to the ship, or within her cognizance, either at sea, or within a harbor, etc. The intermediate divisions or watches of a log-book, containing 4 hours each, are usually signed by the commanding officer thereof, in ships of war, or East Indiamen.—E. A.

Log-Line, the line which is fastened to the log.

Logwood (Fr. *Bois de Campêche*; Ger. *Kampescholz*; Du. *Campecheout*; Sp. *Palo de Campeche*), the wood of a tree (*Hæmatoxylon Campechianum*, Lin.), a native of America, and which attains the greatest perfection at Campeachy, and in the West Indies. It thrives best in a wet soil, with a large proportion of clay. The logwood-tree is like the white thorn, but a great deal larger. The wood is hard, compact, heavy, and of a deep red color internally, which it gives out both to water and alcohol. It is an article of great commercial importance, being extensively used as a dye-wood. It is imported in logs, that are afterward chipped. (The logwood-tree, and the adventures of those that were formerly engaged in cutting it, are described by Dampier; see his *Voyages*, vol. ii., part 2, p. 56, ed. 1729.) We borrow from the learned and able work of Dr. Bancroft, the following curious details with respect to the use of logwood: "Logwood seems to have been first brought to England soon after the accession of Queen Elizabeth; but the various and beautiful colors dyed from it proved so fugacious, that a general outcry against its use was soon raised; and an Act of Parliament was passed in the 23d year of her reign, which prohibited its use as a dye under severe penalties, and not only authorized but directed the burning of it, in whatever hands it might be found within the realm; and though this wood was afterward sometimes clandestinely used (under the feigned name of blackwood), it continued subject to this prohibition for nearly 100 years, or until the passing of the act 13 and 14 Chas. II., the preamble of which declares, that the ingenious industry of modern times hath taught the dyers of England the art of fixing colors made of logwood, *alias* blackwood, so as that, by experience, they are found as lasting as the colors made with any other sort of dyeing wood whatever; and on this ground it repeals so much of the statute of Elizabeth as related to logwood, and gives permission to import and use it for dyeing." Probably the solicitude of the dyers to obtain this permission, induced them to pretend that their industry had done much more than it really had, in fixing the colors of logwood; most of which, even at this time, are notoriously deficient in regard to their durability."—BANCROFT on Permanent Colors.

Loire, La (anc. *Liger*), the longest river in France, rises at the foot of Gerbier des Jones, among the Cevennes Mountains, in the Department of Ardèche, and after a westerly course of 540 miles, falls into the Bay of Biscay. This river drains a district of France nearly equal in extent to one fourth of the entire kingdom. It becomes navigable at Roanne, and passes the flourishing towns of Orleans, Blois, Tours, Saumur, and Nantes. The navigation is interrupted, however, during four or five months of the year, by frost or floods. To obviate some of the difficulties incidental to the navigation of this river, a lateral canal has been formed along a part of its course, extending from the Canal du Centre to the Canal de Briare. The Loire communicates with the Rhone and Seine by means of canals. The affluents of this river are very numerous and important—many of them navigable. Those on the right are, the Arroux, the Nièvre, the

Maine (formed by the union of the Mayenne and the Sarthe); on the left, the Alliet, the Loiret, the Cher, the Indre, the Vienne, the Thouë, and the Sèvre-Nantaise. To prevent the Loire from spreading over the low grounds along its course, it has been banked in by dykes, built much above its ordinary level. These embankments were never known to give way previous to the great floods of 1846. They gave way at the same place during the fearful inundations of June, 1856, carrying away the bridge and village of Savonnières, and inundating the communes of La Riche-extra and La Chapelle-aux-Naux, causing a dreadful loss of life and property. The mouth of the river is about seven miles wide, measured from St. Nazaire to Paimboeuf. Ships find great difficulty in taking the mouth of the river, owing to the exposed nature of its position, and to the numerous sand-banks which traverse it.

Lombard, a term anciently used in England for a banker or money-lender. The name is derived from the Italian merchants, the great usurers or money-lenders of the middle ages, principally from the cities of Lombardy, who are said to have settled in London in the middle of the 13th century, and to have taken up their residence in a street in the city which still bears their name. Lombard usurers were sent to England by Pope Gregory IX. to lend money to convents, communities, and private persons, who were not able to pay down the tenths which were collected throughout the kingdom with great rigor that year, 13 Henry III., 1229. They had offices in Lombard-street, which great banking street is called after them to this day. Their usurious transactions caused their expulsion from the kingdom in the reign of Elizabeth. Stowe, in his *Survey of London*, says, "Then have ye Lombarde-street, so called of the Longobards and other merchants, strangers of diverse nations, assembling there twice every day. The meeting of which merchants there continued until the 22d of December, in the year 1568; on the which day the said merchants to make their meetings at the Bursse, a place then new builded for that purpose, in the ward of Cornhill, and was since, by her majesty Queen Elizabeth, named the Royal Exchange."

London (Latin, *Londinium*; French, *Londres*; Italian, *Londra*), the metropolis of the British empire, and one of the greatest cities of ancient or modern times, is situate on both banks of the Thames, about 45 miles above its mouth at the Nore, and 15 below the highest tideway. Though chiefly within the county of Middlesex, London includes parts of Surrey and Kent, and extends into Essex. St. Paul's, the most striking object in the city, is in lat. $51^{\circ} 30' 48''$ N., long. $0^{\circ} 5' 48''$ W. of Greenwich. Its early history is lost in obscurity, and the first authentic notice of its existence is that of Tacitus (*Annal.*, lib. xiv., cap. 3), who, in alluding to *Londinium*, says, "Cognomento quidem colonie non insigne, sed copia negotiatorum et commeatuum maxime celebre." The derivation of the name "London," has been the subject of much conjecture; but that mentioned by Pennant (*London*, p. 17) seems most feasible, viz., *Llyn*, in Celtic, a lake, and *din*, a town. It could not, however, have been a place of importance at the period of Julius Cæsar's invasion, as it is not noticed in his *Commentaries*. About 100 years thereafter, the Romans, under Claudius, took possession of the city, and called it Augusta, in honor of that prince. It was erected into a prefecture; and the inhabitants, nominally citizens of Rome, were governed by Roman laws and Roman magistrates.

London was not fortified at an early period of the Roman occupation; for in A.D. 61, the Britons under Boadicea, revolted, captured and burned the city, and massacred the inhabitants. The city was soon, however, rebuilt, but is supposed to have remained open till the reign of Constantine the Great. From the number of coins of his time found under the walls, it

may be inferred that that emperor constructed the walls; and it is alleged that he made London an episcopal see. The limits of these walls have been pretty exactly ascertained. They commenced near the site of the present Tower, extended along the Minories and back of Houndsditch, across Bishopsgate-street, in a straight line, by London Wall, to Cripplegate; thence southward to Aldersgate, proceeding afterward by the back of Christ's Hospital and Old Newgate, passing behind the site of Newgate Prison, and so reaching Ludgate; again proceeding westward to the River Fleet, and terminating at a fort called afterward Baynard's Castle. Their compass was completed by another wall along the bank of the Thames. Extent of the walls from and to the side of the river, 2 miles and 1 furlong; on the bank, 1 mile and 1-10th; uniform height, 22 feet. Through gates in these walls, roads led to different parts of the kingdom. The great Roman Roads, Watling-street and Ermin-street, had their termini at the London Stone, or Roman Milliarium, a portion of which still remains, and is inserted in the most conspicuous part of St. Swithin's Church, abutting on Cannon-street. The names of the gates are still preserved in streets, etc., viz., Ludgate, Aldersgate, Moorgate, Bishopsgate, Aldgate, Newgate, Cripplegate, and Postern Row, on Tower Hill. After the Romans withdrew their forces from England, London suffered severely till the Saxons fixed themselves in the country. It is said to have become then the capital of the East Saxon kingdom; at any rate, it quickly regained its former importance, and is called by Venerable Bede a "princely town of trade." Soon after the introduction of Christianity, Old St. Paul's, and St. Peter's at Westminster, were founded. When the Saxon monarchies were united in the person of Egbert, London became the capital of the consolidated kingdom, and such it has continued to be. In the reign of Alfred it recovered from the effects of the Danish invasion, as well as from those of a fire, which nearly consumed it in 893.

After the battle of Hastings, the city submitted to William, who granted it a charter, still extant; and who commenced building the Tower of London in 1078. About this time the capital suffered severely and frequently by fires, especially in 1077 and 1086. In the following reign it was visited by a hurricane and an inundation; the latter carrying away the first wooden bridge over the Thames. Henry I. granted a new charter to the city in 1100, restoring the privileges it enjoyed previous to the Conquest, and conferring on the citizens the right of electing their own magistrates. It is said that this document served as the model for Magna Charta. The population in 1141 was estimated by Peter of Blois at 40,000. The title of the chief magistrate was changed by Henry II. from Portreeve to Bailiff; and in 1191 he is called Lord Mayor, in a document issued by the Court of Aldermen. In 1198 Richard I. committed the duty of fixing a national standard of weights and measures to the sheriffs of London and Middlesex. John, by several charters, conferred additional favors on the city; among others, the jurisdiction and conservation of the Rivers Thames and Medway; and the power of choosing sheriffs. In 1221 the first stone of the present Westminster Abbey was laid by Henry III.; and in 1236 water was conveyed in pipes from the village of Tyburn to the city. In 1258 and 1270 the city was visited by famine, and in 1348 by a species of plague, on all of which occasions it suffered grievously.

Under Edward I. London was first divided into 24 wards, each to choose common councilmen and an alderman. Edward II., in 1316, prohibited as a nuisance the burning of coal, then lately introduced, but his mistake was soon discovered and rectified. Under Edward III. the city received the perpetual right of magistracy over Southwark. In 1881 the citizens were alarmed by the insurrection of Wat Tyler, but

this was soon suppressed. Street lamps were first used in 1416. In the wars of the Roses, London chiefly favored the interests of the House of York; and after the battle of Barnet, in 1471, Edward VI. knighted the mayor, recorder, and 12 aldermen. This was the era of the first printing-press, constructed and worked by Caxton in Westminster Abbey, as well as the erection of water cisterns and conduits in several parts of the city and suburbs. In the reign of Henry VII., a disease called the "sweating sickness" carried off two mayors and six aldermen, with many citizens. Some considerable improvements were made in this reign, as well as in that of Henry VIII., to which the suppression of religious houses by the latter materially contributed; these giving way to schools, hospitals, and charitable institutions. By the aid of Queen Elizabeth, the prosperity of London rapidly advanced during her reign. The refugees from the Netherlands introduced numerous manufactures before unknown in England, and in this way conferred especial benefits on London.

By maps of the time of Elizabeth and James I., it may be seen that the chief part of London then consisted of Newgate-street, Cheapside, the Poultry, and Cornhill, and the various streets and alleys leading from them to the Thames. Along the Strand, toward Westminster, were houses on both sides—those to the south, and abutting on the river, being the palaces of the chief nobility. The names of Salisbury, Norfolk, Buckingham, Arundel, Essex, etc., have been perpetuated in the streets now on the sites of palaces and gardens formerly belonging to these families. Spring Gardens formed a series of walks, with bowling green, etc., extending from Charing Cross toward Whitehall Palace, whence to the Abbey there was a regular street. On the Surrey side, there were not ten buildings between Lambeth and the west foot of Blackfriars Bridge; but from that point a row of houses was continued to the Borough. Southwark then extended but a short distance along High-street; and there were small scattered houses from Tooley-street to Horselydown. In the reign of James I. brick was introduced as a substitute for wood in London houses, and the streets were first paved with stones. The city was severely visited by the plague in 1604, and again in the reign of Charles I. During the civil wars a majority of the corporation took part with the Commons, and the city treasury was of great service to their party.

After the Restoration London began greatly to revive; but a serious check was given to it by the last visit of the plague, which raged from June till the end of December, 1665, and destroyed nearly a third of the population. This was speedily followed by the "Great Fire," which commenced 2d September, 1666, lasted four days and nights, and in that time reduced to ashes five sixths of the whole city within the walls. The ruins covered a space more than a mile long and half a mile broad; and the value of buildings and goods consumed was estimated at ten to twelve millions sterling. But though severe at the time, this visitation contributed materially to the improvement of the city. It was built on a more commodious plan by Sir Christopher Wren in about four years. From the time of its re-construction, few stirring events occurred. The first stone of St. Paul's was laid in 1675. The revocation of the Edict of Nantes in 1685 brought to London many French Protestant families, who peopled Spitalfields, and introduced the manufacture of silk. The continued growth of the city in the reign of Queen Anne occasioned the act of 1711 for building fifty new churches, the cost being paid by a tax on all coals brought into the Thames. The streets were then first generally lighted; fire-engines were provided, and measures taken for watching the city. In her reign, Clerkenwell, Old-street, the lower part of Shore-ditch, Marlborough-street, Soho, Bedford-row, Red

Lion-square, and a district north of Holborn, were annexed to the metropolis.

In the reign of George I. some additions were made to London, chiefly to the north of Oxford-street and about Berkeley-square. In the reign of George II. some new parishes were erected, viz., St. George's, Bloomsbury; St. Ann's, Limehouse; St. Paul's, Deptford; and St. Matthew's, Bethnal Green. The River Fleet was covered, and a market built on it; Grosvenor-square, Westminster Bridge, and Great George-street, were built; and roads were formed in several directions, the principal one skirting the northern part of the city from Paddington to Islington.

The accession of George III. gave a fresh stimulus to improvement and extension. A new bridge at Blackfriars, with handsome streets leading to it, and many new dwellings on the Surrey side, were erected. On the north-west side the parishes of St. Pancras and Marylebone were formed. At the same period the street pavement for foot passengers was first laid down, the kennels removed from the middle to the sides of the streets, and the numbering of houses introduced. The American war gave a temporary check to extension; but soon after the peace of 1783 the advance became more rapid than ever. Docks were constructed, the commerce of the city rapidly augmented, the ground near the water side was covered with buildings, and, westward, Bedford, Russell, and Brunswick Squares quickly sprung up. From the Regency in 1811, London advanced in extent and elegance still more rapidly. Regent's Park was formed, and surrounded by handsome terraces; and within the last few years the extensive and fashionable districts called Belgravia and Tyburnia—the former to the south and the latter to the north of Hyde Park—have been created, and literally covered with houses of a high class. In 1851 there were 805,933 inhabited houses in the metropolis, and there are no less than 6300 streets enumerated in the *London Postal Guide* for January, 1857.

The situation of London, on the banks of a great tidal river, is also peculiarly favorable for a large city in a sanitary point of view. The subsoil is partly clay (the London clay of the geologist). The valley of the Thames has a gradual ascent on the north side; and the south side, though below the level of spring tides, has been well secured against inundations by embankments. The air is temperate and rather dry than moist, and the health of the inhabitants has gradually but rapidly improved from the earlier part of last century, when the deaths were annually 1 in 20 of the population, whereas at present they are about 1 in 40.

It is difficult to assign any distinct boundaries to the metropolis, as almost continuous lines of houses stretch like branches from the main trunk of London, to Chiswick, Kensal Green, Kilburn, Hampstead, Highgate, Stamford Hill, and Upper Clapton in Middlesex; Stratford and North Woolwich in Essex; Greenwich and Lee in Kent; and Dulwich, Norwood, Clapham, Wandsworth, and Putney in Surrey. These, too, are constantly increasing in length and breadth; the vacant spaces between distant lines of road being filled up with extraordinary rapidity. The circle formed on a radius of four miles from Charing Cross excludes a large portion of London; but its extreme length may be set down as ten miles, and its breadth at about six. There are four divisions of the metropolis which, though rather vague, are pretty generally understood by Londoners—these are, the City, the West End, Lambeth, and the Borough; the two first on the Middlesex, and the others on the Surrey side of the water. The city of London proper has an area of 725 acres, and contains 108 parishes—97 within and 11 without the walls. In its most limited sense, the metropolis includes the cities of London and Westminster, the parliamentary boroughs of Tower Ham-

lets, Finsbury, Marylebone, Lambeth, and Southwark. Annexed is an account of the population of the various

cities and boroughs above mentioned, as ascertained by the different censuses, beginning with the first in 1801:

Cities and Boroughs.	1801.	1811.	1821.	1831.	1841.	1851.
London City.....	156,859	120,909	125,434	122,863	120,702	127,869
Westminster City.....	153,210	162,085	182,085	201,842	219,390	241,611
Tower Hamlets Borough.....	184,568	287,487	291,650	357,246	419,730	539,111
Finsbury.....	184,616	167,190	201,731	259,123	265,043	329,772
Marylebone.....	97,642	126,566	174,354	240,294	287,465	370,957
Lambeth.....	49,886	76,806	108,565	160,568	197,412	251,345
Southwark.....	94,518	103,763	123,663	134,117	142,620	172,863
Total.....	876,954	994,746	1,207,482	1,476,048	1,652,902	2,027,523

The metropolitan district comprised within the bills of mortality includes, with the cities and boroughs embraced in the foregoing table, other integral parts of London, like Chelsea, Brompton, and Kensington; and the suburbs, such as Greenwich, Wandsworth, Hammersmith, Putney, etc. In this view, the area of the metropolis is 78,029 acres, comprising 186 parishes, and the present population may be estimated at upward of 2,500,000. Annexed is an account of the population of this area at the date of each census, commencing with 1801:

Years.	Population.	Years.	Population.
1801.....	958,868	1831.....	1,654,994
1811.....	1,198,815	1841.....	1,948,417
1821.....	1,378,947	1851.....	2,362,236

But many merchants and citizens, taking advantage of the easy access to the country afforded by the railways, occupy houses at such places as Kingston, Esther, Walton, Richmond, Twickenham, Staines, Windsor, Reigate, Brighton, etc., making daily journeys to and from the city, so that they and their families are not included in the foregoing account.

Commerce.—As one of the great occupations of its inhabitants, the commerce of London demands the first notice. The capital of a great empire, with immense wealth concentrated in it, having easy access, both by land and water, to all parts of the kingdom, and every facility of communication with foreign countries, London has become, with perhaps the single exception of New York, the greatest commercial city in the world. The commercial growth and prosperity of London are especially to be ascribed to its great river-port, the Thames. This famous stream has its source within the borders of Gloucestershire, a little to the south-west of Cirencester, and becomes navigable at Lechlade, 138 miles above London. It is first affected by the tide about 15 miles above the metropolis; but before reaching this point it is swollen by junction with the Isis, Kennet, Coln, and Wey. The city corporation are the chief conservators of the river, and appoint a navigation committee, who superintend the towing-paths, bridges, water-courses, and whatever relates to the river, as far as a stone a little above Staine's Bridge. Higher up the supervision is divided between the city and a body chiefly composed of the landowners on both sides of the river. The conservation of the river below London is also in some measure under the government of the city corporation, but the Trinity House has concurrent jurisdiction, and no ballast can be raised without its authority. The appointment and control of pilots, the placing and repairs of land-marks and buoys to indicate the channels, and the establishment of floating lights, are also under the superintendence of the Trinity House. Close to London Bridge there is water sufficient for vessels of 800 tons burden, and the legislature has placed the shipping of the port, and their moorings, under the direction of the harbor-masters, nominated by the corporation, and approved by the Trinity House. The sinuosities, currents, and shoals in the river, and its varying depth, render the navigation rather intricate. The river pilots, who are a distinct class, conduct vessels to Gravesend, where they are relieved by the sea pilots. Down to 1800, the commerce of London, and the shipping interest, suffered materially from the crowded state of the river, and the difficulties, delays,

and abuses connected with the berthing and mooring of vessels, and the landing and storing of merchandise. These evils led to the construction of the West India Docks, which were opened in August, 1802. These, next to the Commercial Docks, the oldest in London, were formed in the gorge of the Isle of Dogs, on the Middlesex side of the river. They comprise the import and export dock (communicating with the river at Blackwall and Limehouse), and a dock of 19 acres for bonded timber.

The export dock occupies about 25, and the import dock 30, acres. The gates are 45 feet wide, and admit vessels of 1200 tons. At the highest spring-tides the water is 24 feet deep; and within the docks there is sufficient space for 600 vessels of from 250 to 600 tons. The import and export docks are parallel to each other, but divided by stacks of warehouses. There are sheds for sheltering the goods; and the chief warehouses are capable of storing 170,000 hhds. of sugar, besides coffee and other tropical productions. The whole space occupied by these docks and warehouses is 295 acres. The East India Docks at Blackwall now belong to, and are managed by, the same company as the West India Docks. They were commenced in 1803, finished in 1806, and were intended to accommodate the trade of the East India Company. They include an import basin of 18 acres, an export basin of about 9, and an entrance basin of 2½ acres. The entrance lock is 210 feet wide, the width of the gates 48 feet, and the depth of water in the docks is never less than 23 feet. The extent of warehouse-room at these docks is comparatively small. The East and West India Docks are well inclosed and guarded, and the buildings are fireproof. The London Docks, situated between Ratcliff Highway and the Thames, were begun in June, 1802, and opened in January, 1805. They consist of two docks; the western, covering 20 acres, and the eastern about 7 acres. The latter is entered from Shadwell, and the former near Wapping Old Stairs, and also at the Hermitage. The whole can receive 500 vessels of from 200 to 800 tons. The entire space inclosed is 71 acres. The warehouses are very fine; the most extraordinary being that for bonded tobacco. The roof and pillars supporting it are of iron, and the whole building covers five acres of land, and is capable of containing 24,000 hhds. The company is governed by a body of directors, of whom the lord mayor is one. The regulations to prevent fire and pilfering are as effectual as in the East India Docks. St. Katherine's Docks, situate between the London Docks and the Tower, were executed in a year and a half, and first opened in October, 1828. The whole extent of the property is 24 acres, of which nearly one half is inclosed in the two docks, communicating by a basin. The entrance lock, near Irongate Wharf, is 180 feet long, and 45 feet broad, and admits ships of from 200 to 800 tons. The warehouses are very large and commodious, and the regulations and charges are similar to those of the other dock. Victoria Docks, the last constructed, were completed in 1855. They are situated in the Plaistow Marshes, immediately below the East and West India Docks. The portion of this property appropriated by the Dock Company for their own purposes is about 200 acres, but the dock itself occupies but 74, and affords 284 feet depth of water. The en-

trance lock at Bow Creek is 300 feet long, and 80 wide. There is a half-tide basin of 16 acres; and the available warehouse floor is stated to be upward of 11 acres. The company have also acquired about an acre and a half between Thames-street and the river for the erection of an up-town warehouse. One object of the company is to withdraw from the Thames a portion of the large fleet of colliers which lie at anchor in the Pool, and seriously obstruct the traffic on the river. On the other bank of the Thames, extending along the side of the river opposite Limehouse, and terminating nearly opposite the entrance to the West India Docks, are the Commercial, formerly the Greenland Docks, which existed in the 17th century. They are now of great extent, inclosing 120 acres, of which 70 are water, and were designed to receive vessels laden with timber, corn, and other commodities more bulky than costly. These docks are entered by a basin near Dog-and-Duck Stairs, sometimes called the East Country Docks, and the main body of the water within is divided into six unequal parts. See DOCKS.

Parallel to these is the Surrey Canal, having an inner and outer dock at the entrance in Rotherhithe, by which ships are received, and affording communication with the Croydon Canal. The Regent's Canal was formed to save expense of cartage through London of articles brought by sea, and afterward forwarded for consumption to the north-west parts of the metropolis; and also to communicate with the Grand Junction Canal. The Regent's Canal passes from Paddington, by a tunnel under Maida Hill, to the Regent's Park, thence to Islington, under which it is carried by a tunnel three quarters of a mile in length, and so on to Hoxton, Hackney, and Limehouse. It is 9 miles long, and is provided with 12 large locks. It is not easy, within a moderate compass, to give even a sketch of the foreign commerce of London. It would be an epitome of that of the world. To the British capital are brought the products, natural and artificial, of all soils and all climates. It has in store whatever the ingenuity and industry of man in any part of the globe can spare to exchange for what his own country does not yield. We can, therefore, do little more than state the number and size of the vessels that belong to and frequent the port, and the value of the produce and manufactures of the United Kingdom exported from the same:

ACCOUNT OF THE NUMBER AND TONNAGE OF VESSELS BELONGING TO THE PORT OF LONDON ON 31ST DECEMBER, 1855.

Description of vessels.	Under 50 tons.		Above 50 tons.	
	Vessels.	Tons.	Vessels.	Tons.

The conveyance of coals to London employs a great deal of shipping. They are chiefly brought from the north-eastern district of the kingdom, and are sold at the New Coal Exchange, lately erected in Lower Thames-street.

Very large quantities of coal now reach London by means of the railways which centre in the metropolis.

ACCOUNT OF THE NUMBER OF SHIPS LADEN WITH COAL WHICH ENTERED THE PORT OF LONDON IN EACH YEAR FROM 1845 TO 1855 INCLUSIVE.

Years.	Ships.	Years.	Ships.
1845.....	11,987	1851.....	11,765
1846.....	10,488	1852.....	12,085

1849.....	12,074	1855.....	10,784
1850.....	12,633		

DECLARED VALUE OF BRITISH AND IRISH PRODUCE AND MANUFACTURES EXPORTED FROM LONDON TO FOREIGN COUNTRIES AND THE COLONIES IN 1855 AND 1856.

1855.....	£20,915,512
1856.....	25,966,083

Custom-house.—The present custom-house, opened in May, 1817, stands in Lower Thames-street, with its principal and imposing front, 480 feet long, toward the river, and occupies the site of a similar but smaller one destroyed by fire in 1814, as a preceding one had been in 1718. The Long Room is a noble apartment, 186 feet long, 60 broad, and of an appropriate height, with desks on each side for the several officers; the centre being left for such of the public as have business there. The other parts are distributed so as to suit the several branches of the office. The London customs establishment of clerks, tide-waiters, etc., amounted in 1856 to 2167; though as but 1620 were required for all the other English ports, it would seem as if the numbers here were excessive.

AMOUNT OF CUSTOMS DUTIES COLLECTED IN THE PORT OF LONDON IN 1855 AND 1856.

1855.....	£11,525,125
1856.....	12,287,519

Trinity House.—The Society of the Trinity House has its chief establishment in a large and handsome house on Tower Hill, built by Wyatt in 1793. It was incorporated in 1815; but from the terms of its charter, it evidently had a previous existence, and was then established at Deptford Stroud. Its privileges were confirmed by the charter of 1658, and its members are now partly men of high rank, and partly those remarkable for naval knowledge and skill in maritime affairs. Its duties as to pilots, light-houses, buoys, ballast, etc., have already been mentioned. In process of time this society acquired large property; the net revenue under its management having in 1855 amounted to £204,195. Until the passing of the act 13th and 17th Vic., c. 131, the society spent much of its surplus revenue in pensions to poor and disabled seamen, or their widows and orphans; but this act transfers their revenue, as well as the charge for maintaining light-houses, etc., to the Mercantile Marine Fund. It would appear, from a parliamentary paper lately published, that the Board of Trade expended in 1856 out of this fund £1388 as rewards for the salvage of life. The Trinity House contains some portraits of naval heroes, naval trophies, etc.

Mint.—The Royal Mint, also on Tower Hill, was removed thither from the Tower in 1811. The present building which is extensive and well suited to its purpose, was completed under the direction of Sir R. Smirke. The interior is appropriately arranged for the manufacture of coin; and the machinery combines great ingenuity and beauty. In consequence of the report of a commission in 1849, the old company of moneyers was abolished, and a scientific chief has since been allotted to this department, instead of a political one. The amount of gold, silver, and copper money coined here in the last three years has been as follows:

ACCOUNT OF THE TOTAL VALUE OF GOLD, SILVER, AND COPPER COINED AT THE MINT IN EACH OF THE THREE YEARS ENDING WITH 1856.

Year.	Gold.	Silver.	Copper.	Total.
1854	£4,152,188	£140,480	£30,866	£4,323,529
1855	9,008,663	195,511	41,091	9,245,265
1856	6,002,114	462,523	11,418	6,476,060
Total	£19,162,960	£798,519	£81,375	£20,042,854

Banks.—The Bank of England, one of the most attractive objects in the city, was founded by act of Parliament in 1694, and its business was carried on for many years at Grocers' Hall. In 1733 it was transferred to Threadneedle-street, and soon thereafter the present hall and bullion office were opened. Between 1770 and 1788 the façade was extended, and two wings added, under the directions of Sir Robert Taylor and Sir John Soane. Under the superintendence of the latter, the front and wings of the original structure were harmonized. The area of the bank is an irregular quadrangle; the south or principal front is 365 feet, and the north 410; the east 245 feet, and the west 440. Its principal entrance is from Threadneedle-street, the other two from Bartholomew Lane and Lothbury. The interior contains several open courts, the rotunda, or circular room, numerous offices, committee-rooms, and private apartments for the residence of officers and servants. The business is carried on by a staff of about 800 clerks, etc., whose salaries amount to nearly £200,000. The bank has received nine successive renewals of its charter since it was first granted in 1694, and measures have been taken in Parliament this session (the first of 1857) for again renewing it. The act of 1844, still in force, separated the Bank into two distinct branches, viz.: 1. The Issue Department, devoted to its business as agent of the State in creating and issuing paper money, or bank-notes, convertible into gold on demand; and, 2. The Banking Department, where the private business of deposit and discount is carried on. There are 60 private and 28 joint-stock banks in the metropolis. Some few of the former, such as Child's, in Fleet-street, were established before the end of the 17th century; while the joint-stock banks are all the offspring of the last few years. There is an establishment near Lombard-street, called the Clearing House, where a daily exchange of checks or drafts on city bankers is effected, and this process tends greatly to facilitate banking business.

Royal Exchange.—The Royal Exchange, colossal in proportions, and occupying a commanding position between the Bank of England and Cornhill, is a spot where great mercantile transactions are daily concluded. The first exchange was built by Sir Thomas Gresham, completed in 1567, but destroyed by the great fire of 1666. It was, however, speedily rebuilt, and was opened on 28th September, 1669. Again destroyed by fire in 1838, it was rebuilt, and completed in 1846 by Mr. Tite. The present building is quadrangular, and the interior surrounded by arcades. In the centre, which is uncovered and unprotected from the weather, stands a statue of her majesty by Lough. The outside of the building, except the grand western entrance, is occupied by small shops; and on the upper floor is Lloyd's, where the business of marine insurance is conducted by underwriters. It has been estimated that, on an average, 200,000 persons daily visit the exchange, but this can be little more than conjecture. Merchants and brokers resort much to coffee-houses in the vicinity of the Exchange for the transaction of business. Most of the larger transactions are negotiated by brokers, who in general confine themselves to one branch of trade, with which they are thoroughly acquainted. Thus we have colonial brokers, insurance brokers, ship brokers, stock brokers, bill or money brokers, etc. Near the Royal Exchange and the Bank is the Stock Exchange, where real and fictitious sales are made of property in the public funds, etc.; the latter for the most part being a species of gambling.

London, when compared with some of the towns in the north and west of England, can scarcely be called a manufacturing place; yet the various articles produced here employ many thousand persons. The silk manufacture especially employs a large number of hands. Originally introduced by French Protestant

refugees, many of their descendants still continue the trade, which employed, in 1851, 15,764 persons, of whom 8277 were females. The manufacture of London porter and beer is a much more lucrative business, but a London brewery requires a very large capital. Sugar-refining and clock and watch making also prevail to a considerable extent, the latter chiefly in a district called Clerkenwell. London-built carriages are generally considered the best, as they are undoubtedly the most elegant in the world. London enjoys a high reputation for the manufacture of numerous smaller articles, such as mathematical, surgical, and musical instruments, jewelry of the superior kinds, gold and silver plate, etc. The great number of those employed in house-building proves that the metropolis is still rapidly extending; and though this business received a severe check during the late war with Russia, it was only temporary, as evinced by the general resumption of building in the various outskirts of London.

The shops in London are, generally speaking, well managed, and many of them are handsomely fitted up, especially those in Bond-street, Regent-street, and Oxford-street. The wholesale shops or warehouses are chiefly to be found in the city; the retail shops, particularly those on a large scale, being more general in the west or fashionable end of the metropolis. The bazaars in London, each of which forms an aggregation of shops or stalls, are not now so attractive as they once were. They deal mostly in fancy goods, furniture, toys, etc. The four great establishments of the kind are those in Soho Square and Baker-street, the Pantheon in Oxford-street, and the Pantheonicon in Halkin-street, Belgrave Square. The Burlington and Lowther Arcades contain many shops for the sale of the like commodities.

TABLE SHOWING THE AREA IN SQUARE MILES, AND THE POPULATION OF THE METROPOLIS, THE NUMBER OF HOUSES THEREIN, AND THE NUMBER OF FAMILIES OCCUPYING THE SAME IN 1851.

Divisions.	Area in square miles.	Houses.			Families or groups of well-to-do.	Population.
		Inhabited.	Uninhabited.	Build- ing.		
Middlesex.....	51	218,279	10,618	3,046	395,708	1,745,601
Surrey.....	96	72,844	4,524	1,160	110,097	482,435
Kent.....	35	20,310	1,506	609	27,850	134,202
Total.....	122	305,983	16,964	4,815	538,550	2,362,238

ACCOUNT SHOWING THE NUMBER OF PERSONS OVER 20 YEARS OF AGE IN THE METROPOLIS IN 1851, DISTINGUISHING THE MARRIED FROM THE UNMARRIED.

Sexes.	Of the age of 20 and upward.			
	Total.	Bachelors and spinsters.	Husbands and wives.	Widowers and widows.
Males.....	682,545	196,857	398,624	37,064
Females.....	762,418	246,124	406,266	110,028

From different quarters we have gleaned the following estimates of the annual consumption of certain articles of London food. All, however, may be considered applicable to the period of the last census in 1851:

Wheat.....	1,600,000 quarters.
Bullocks.....	240,000 head.
Sheep.....	1,700,000 "
Calves.....	28,000 "
Pigs.....	35,000 "
Poultry.....	8,748,000 "
Game, etc.....	1,807,000 "
Fish, wet and dry, of which more than half were herrings.....	450,150,900 lbs.
Oysters.....	809,935 barrels.
Potatoes.....	810,464,000 lbs.
Cabbages.....	89,672,000 "
Onions.....	1,480,600 "
Apples.....	725,500 bushels.
Foreign eggs.....	about 75,000,000
Milk, the produce of.....	13,000 cows.

* Exclusive of large quantities of bacon and ham.

Water.—Although London is supplied with many excellent springs of fresh water, they proved, centu-

ries ago, quite inadequate to the wants of the citizens. As already mentioned, conduits were then adopted as a substitute. The first effort to supply water on a great scale was made in 1608 by Sir Hugh Myddelton—a spirited citizen, who undertook, at his own risk, to convey a river of fresh and good water to the city. From this we may presume that in Myddelton's time the Thames no longer merited the eulogy of Stowe, that its "water was as cleere as that of the sea." In 1613 the River Lea water was let into the basin at the

New River head at Islington, and thence, at the present day, the New River Company, with increased means, transmit the water through pipes to the houses, etc., supplied by them.

Bridges.—The bridges spanning the Thames in its passage through London, are nine in number, eight of these being adapted for carriages. The cost of New Westminster Bridge is estimated at £235,000. The following table will show the cost and dimensions of these various bridges:

TABLE SHOWING THE MATERIAL, COST, ETC., OF THE BRIDGES OVER THE THAMES, IN LONDON AND ITS VICINITY.

Names.	Date of completion.	Material.	Cost including Approaches.	Cost exclusive of Approaches.	Number of Arches.	Length.	Breadth.	Span of central Arch.
						Feet.	Feet.	Feet.
London Bridge.....	1881	Granite.....	£2,000,000	£542,150	5	904	53	150
Southwark.....	1819	Iron arches, stone piers..	800,000	384,000	2	800	42	240
Blackfriars.....	1770	Stone.....	260,000	157,840	9	995	42	100
Waterloo.....	1817	Granite.....	1,150,000	579,915	9	1,850	42	120
Westminster.....	1751	Portland stone.....	389,500	15	1,160	43	76
Vauxhall.....	1814	Iron arches, stone piers..	Unknown.	800,000	9	840	36	78
Hungerford Suspension.....	1845	Brick and stone piers....	113,000	95,760	NIL	1,536	13
Chelsea Suspension.....	1857	Iron piers and roadway..	85,000	922	45
Battersea.....	1770	Wood.....	Unknown.

Trade of 1856.—The East India and China Association have published their usual comparative statement of the number of ships, both British and foreign, with their aggregate tonnage, entered inward and cleared outward with cargo from and to places within the limits of the East India Company's charter, from the 1st of January to the 31st of March, 1855 and 1856. According to the statistics of the vessels entered inward, the return for the port of London shows a decrease of 31 vessels and 8971 tons, the difference between 197 vessels, with the capacity of 109,484 tons, in 1855, and 166 vessels, with a capacity of 100,513 tons, in 1856. Liverpool figures for an increase of 8 vessels and 14,339 tons, the arrivals in the former period having been 62 vessels, with a capacity of 39,364 tons, and in the latter 70 vessels, with a capacity of 53,703 tons. With regard to Bristol, there is a decrease of 3 vessels, with an increase of 806 tons; the arrivals in 1855 having been 10 vessels, with a capacity of 2917 tons, and in 1856 7 vessels, with a capacity of 3723 tons. The return for the Clyde exhibits a decrease of 2 vessels and an increase of 722 tons, the difference between 8 vessels, with a capacity of 3414 tons, and 10 vessels with a capacity of 2629 tons. A review of these figures shows a net decrease of 24 vessels and an increase of 5452 tons; the arrivals in 1855 having been 277 vessels, with a capacity of 155,179 tons, and in 1856 253 vessels, with a capacity of 160,631 tons. The principal arrivals were from Calcutta, Madras, and the Cape of Good Hope. According to the statistics of vessels cleared outward, the return for the port of London exhibits an increase of 6 vessels, and 5905 tons; the departures in 1855 having been 157 vessels, with a capacity of 94,784 tons, and in 1856 163 vessels, with a capacity of 100,689 tons. In the case of Liverpool there is a decrease of 9 vessels and 11,197 tons, the difference between 98 vessels, with a capacity of 80,444 tons, and 89 vessels, with a capacity of 69,247 tons. The figures for Bristol show a decrease of 2 vessels and 459 tons; the departures in 1855 having been 3 vessels, with a capacity of 1641 tons, and in 1856 1 vessel, with a capacity of 1182 tons. With regard to the Clyde, the results show a decrease of 3 vessels, with 2534 tons, the difference between 25 vessels, with a capacity of 16,044 tons, and 22 vessels, with a capacity of 13,510 tons. Taking the result of the whole return, there is a net decrease of 8 vessels, with 8285 tons; the departures in 1855 having been 283 vessels, with a capacity of 192,913 tons, and in 1856 275 vessels, with a capacity of 184,628 tons. The principal decline has been in departures for Australia, Calcutta, the Mauritius, Java and Sumatra, and Arabia. For a full exhibit of the commerce of Great Britain, including that of London, see GREAT BRITAIN.

Long Island, N. Y. Situated in the south-east part of the State, and contains 1500 square miles, lying between the Atlantic on the south, and Long Island Sound on the north. It contains three counties—Kings on the west end, Queens in the middle, and Suffolk on the east end of the island. A chain of hills runs from west to east, on the north of which the surface is somewhat hilly and broken; on the south it is level. The north shore is somewhat bold; on the south it is a beach of sand and gravel, inclosing bays, with various inlets, admitting vessels of 60 or 70 tons, and abounding with shell and other fish. At the east end is Gardiner's Bay and Island, and Montauk Point, a bold promontory, on which is a light-house. The north shore has several light-houses.

Longitude. By the term *geographical longitude*, is meant an arc which measures the inclinations of two terrestrial meridional planes, one of which passes through a known place as a place of reference, the other through any place whatever. It is sometimes also defined as the distance east or west, along the equator, of any place from a certain meridian. Longitude was determined by Hipparchus at Nice, who fixed the first degree in the Canaries, 162 B. C. Harrison made a time-keeper in A. D. 1759, which in two voyages was found to correct the longitude within the limits required by the act of Parliament, 12th Anne, 1714; and in 1763, he applied for the reward of £20,000 offered by that act, which he received. The celebrated Le Roi of Paris, in 1766, invented a watch that keeps time better; and the chronometers of Arnold, Earnshaw, and Bréguet, bring the longitude almost to the truth. Philosophers have sought the longitude in vain; but Newton has said it will yet be discovered by a fool. The selection of a station from which the longitudes of all other places are to be reckoned is entirely arbitrary; British astronomers and geographers have chosen the meridian of the Royal Observatory of Greenwich as their *first meridian*. The French and other continental nations refer the longitudes of all places to the meridian of their principal observatory. The longitude of a place may be expressed in hours, minutes, and seconds of time, or in degrees, minutes, and seconds of space; if it be given in either, it may be translated into the other. The reason of this is, that the earth revolves on its axis from west to east in 24 mean solar hours, thereby causing the first meridian to describe during that time a space equal to 360°, and therefore, in one hour, 15°. Hence, if the plane of the first meridian pass at the present moment through the sun, then the meridian of a place 15° west of the former, will pass through the sun exactly one hour after; if the place be 15° east of the first meridian, the plane of the former will pass through the sun one hour before the latter. The sun always

passes the meridian of any place when highest in the heavens, *i. e.*, at mid-day, or 12 o'clock mean solar time. Wherefore, places lying to the east of the first meridian will have every hour earlier, but places lying to the west of that meridian will have every hour later than it; so that if, while the meridian of one place is passing through the sun, the time be known before the meridian of another place pass through the sun, then the longitude of that place from the former is determined, the time being turned into space at the rate of 15° to the hour. Hence, therefore, places will have east or west longitude, according as they lie east or west of Greenwich Observatory, the longitude of the meridian of which is zero.

The problem of the longitude may be reduced to this—Given the hour by calculation at the place of observation, to find the hour at Greenwich Observatory corresponding to the same time; the difference of times gives the longitude of the place from Greenwich. The solution of this problem was attempted in very early times, dating even from the time of the ancient Egyptians, but the results obtained were very inaccurate. These results were deduced from tables of celestial phenomena calculated for a certain meridian, and then the times were compared with the times at which the same phenomena appeared at a different place; actual admeasurement was also employed. But it was not until after the invention of watches that the problem was rendered solvable. Harrison, in the 18th century, was the first who gave a true solution by a watch; but the first accurate resolution of the problem may be said to date from the discovery by Galileo of Jupiter's satellites, and his tables of their motions. The result of the problem at this period, as well as now, was, as Wolfius has expressed it, that the means might be found whereby the art of navigation might be brought to its utmost pitch of perfection. If the advantages of determining the longitude to a commercial and maritime people be considered, it will not appear surprising that princes and others should have held out high rewards for a true solution of the problem. Philip III., King of Spain, saw its value, and in 1598 offered a reward of 1000 crowns to the person who would solve it. The States of Holland imitated his example by a prize of 10,000 florins. In the year 1714, the British government offered a premium of £20,000 for any method whereby the longitude might be determined at sea to within 30 miles; £15,000, if the proposed method would give it to within 40 geographical miles; £10,000, if it would determine the longitude to within 60 miles. It was also enacted, that a reward of £5000 would be given to the inventor of any time-keeper which should enable a ship, during a voyage of six months, to keep her longitude to within 60 miles; £7500, if within 40 miles; and £10,000, if within 30 miles. If the method were by improved astronomical tables, the reward was to be £5000, the tables being compared with previous observations. France, also, in 1716, under the regency of the Duke of Orleans, offered a prize of 100,000 livres. In consequence of these rewards, many and various methods were proposed, the best of which, at least as respects frequency of observation and shortness of calculation, is the method of *Lunar Distances*.

Jean Werner of Nuremberg, appears to be the first who proposed, in his *Ptolemy's Geography*, 1514, a method of finding the longitude by the distance between the moon and a star. The lunar method was also recommended by Orondé Finé de Briançon, in his book *De Inveniendi Longitudine*; by Gemma Frisius, in his treatise *Structura Rationis Astronomici et Geometrici*, 1545; by Kepler, in his *Rudolphine Tables*; and by Christian Longomontanus, in his *Astronomia Danica*, 1622. Gemma Frisius is, moreover, said to have attempted the longitude by a watch some time after 1580. Carpenter, in his *Geography*, 1635, says that the lunar method is to be ascribed to Pierre Applan, a

German, born in 1495. John Baptiste Morin, in 1634, attempted to improve the lunar method, and received, in 1645, a pension of 2000 livres; but his improvements were useless, as Paschal declared, owing to the imperfect nature of the existing tables.

The tables of celestial observations previous to Flamsteed's time were imperfect and erroneous; those generally used were Tycho Brahe's, or Kepler's, and to show that they were of little value in determining the longitude, although invaluable in other respects, it may be stated that Flamsteed's observed differed from Tycho's computed places by $5'$, $6'$, or more; and the tabulated distances of the latter differed from the observed distances of the former by $15'$ or $20'$, which would cause an error in the longitude of about 15° , or 300 leagues. Tycho's *lunar theory*, and the tables grounded on it, were in error $12'$ and more. The uncertainty, then, of these tables being known, as well as the paucity of astronomical observations generally, a Frenchman, named Le Sieur de St. Pierre, contrived, in 1674, to get his pretensions to the discovery of the longitude brought under the notice of Charles II., of Britain and the court. Commissioners were appointed, and St. Pierre's data necessary to work the problem were as follows:—1. The heights of two stars, and on which side of the meridian they were; 2. The heights of the two limbs of the moon; 3. The height of the pole; all to be given in degrees and minutes; and 4. The year and day of observation. Flamsteed being in London at the time, was appointed, not only to act as a commissioner, but also to supply the necessary data. St. Pierre, having received the data which he required, refused to work the problem, because he alleged the observations given him were feigned. Flamsteed, on this, wrote to the commissioners, assuring them that the observations were genuine, and at the same time stated, that the longitude could not be solved by the conditions proposed; but if the tables of celestial observations, especially those of the moon, could be rendered more accurate, then the longitude might be determined by them. On the letter being shown to Charles, his majesty was startled at the assertion of the computed places not agreeing with the observed, and said with some vehemence, he must have them observed, examined, and corrected anew for the use of his seamen. It was this simple incident which led to the formation of the Royal Observatory of Greenwich, the foundation of which was laid by Flamsteed on the 10th of August, 1675; and it was in that building that Flamsteed labored for 44 years, under the most trying circumstances, to correct existing tables, and to commence the *British Catalogue*, one of the noblest monuments of British perseverance. So valuable were Flamsteed's observations to Newton, that they enabled him to form his *lunar theory*, which is now of such consequence in determining the longitude.

From the improvements made in watches by Huygens, Hooke, and others, previous to the year 1714, it was thought that the longitude would be solved by this machine. Hence, after 1714, the best artists applied themselves to the construction and improvement of watches. Henry Sully, an Englishman, but resident at Paris, tried in 1726 to determine the longitude by a *marine watch*, but without success. Julian Leroy, one of his pupils, would appear to lay claim to priority of invention; but it has never been disputed that the honor of solving the difficult problem of the longitude by means of a watch belongs wholly to Harrison. This ingenious workman began, at a very early period, to make experiments on pendulums made of different metals, in order to counteract the effects of heat and cold. In the year 1736 Harrison was brought into notice by a pendulum clock which he had made in 1726, and which, for ten successive years, kept remarkably exact time. This clock was tried in a voyage to Lisbon during August, 1736, when it corrected an error in the ship's reckoning of $1^\circ 30'$. At the special

request of the commissioners of longitude, who advanced him money, he continued his experiments on watches from 1757 till 1761, when he produced three watches, or time-keepers—the third the most accurate, and about 4 inches in diameter. This watch, or chronometer, was tried in a voyage to Jamaica as to its practicability in determining the longitude. The trial was eminently successful: the difference of time as shown by the chronometer indicating Greenwich or rather Portsmouth local time, and the local time of the place, being 4 seconds of time, which is equivalent to 1 nautical mile in the parallel of Jamaica. On the arrival of the vessel at Portsmouth, it was found that the error of the chronometer was only $1^{\circ} 53' 5''$, or $28^{\circ} 375'$ for the entire voyage, which, in the parallel of Portsmouth, would be equivalent to 18 nautical miles. Since this error was within the limit prescribed by the act, Harrison claimed the full reward of £20,000; but the commissioners, considering the matter in all its detail, came to the conclusion that the watch was not yet sufficiently tried. In order, however, to testify their appreciation of the invention, they gave Harrison a grant of £5000, and requested him to improve the watch still further against a second voyage. This voyage was undertaken, in 1764, to Barbadoes; and that no misunderstanding might ensue, Maskelyne and Green were also sent out to make the necessary astronomical observations at that place. The difference of longitude, as shown by the chronometer and that by astronomical observation, was $43''$ of time, which is equivalent to $10' 45''$ of space, or longitude. In consequence of the success attending this and the former trial, the House of Commons ordered one half of the reward promised by the act of 1714, or £10,000, to be paid to Mr. Harrison, the inventor of the *longitude clock*; the other half to be paid him when watches, constructed on principles stated by him, should determine by trial the longitude of any place to within 30 nautical miles. Another condition annexed to the payment of the other £10,000 was, that the inventor should give on an oath a full explanation of the principles on which the watch was constructed. This was done most willingly, and Harrison delivered over all his watches to government. The first watch made on Harrison's principles was that by Mr. Kendall; it was found to exceed the regularity of the best of its models. This instrument was committed to the care of Mr. Wales, in his voyage round the world with Captain Cooke, during the years 1772, 1773, etc., and such was its success, that in 1774 an appeal was made to the House of Commons to order the remaining sum to be paid to Mr. Harrison, which was accordingly done. Harrison realized by his invention alone upward of £24,000.

Several other parties received rewards for their improvements in chronometers. Arnold & Son received £3000, and Mudge £500.

Since Harrison's time, remarkable improvements have been made in time-keepers, or *chronometers*, as they are now termed; no one sustaining a good character that gains or loses more than a single second in one day.

But while watches were thus gradually being perfected, the tables of celestial motions were also attended to. Halley, on succeeding Flamsteed as astronomer-royal, continued improving what the latter had begun, so that for 1780, and consequently for the future, the *Caroline Tables* were presumed to give the true place of the moon within the compass of $2'$ of her motion. But however perfect such tables may be made, they will be useless without a proper instrument with which to take angles accurately at sea. Dr. Halley proposed to overcome this obstacle, by using on shipboard a telescope of five or six feet; but the error in such a case would nearly equal 2° , or under the equator the longitude would be in excess or defect about 40 leagues. But in 1761 Mr. Hadley communi-

cated to the Royal Society the nature of the *sextant*, which he had then invented. The sextant is an instrument for taking angles at sea with surprising accuracy; its principle depends on the law of the reflection of light. This instrument was tried in several voyages with wonderful success; but its results were most accurate when used with Professor Mayer's *Tables of the Moon*, computed for the meridian of Paris. These tables first appeared in the *Memoirs of Göttingen* for 1742, and a manuscript copy was sent in 1755 by Mayer to the Board of Longitude, setting forth, at the same time, his claim for some one of the rewards which he might be thought to merit. These tables were placed in the hands of Dr. Bradley, astronomer-royal, who compared several hundred computed longitudes of the moon with his own observed longitudes, and never found a greater difference than $1'.5$. Dr. Bradley showed the commissioners the value of these tables. Mayer died in 1762; but having in the interval greatly improved his tables, his widow sent them in 1763 to the Board of Longitude. These are the tables which, in consideration of their value in finding the longitude at sea, were, by act of Parliament, honored with a reward of £5000, which was paid, in 1765, to Mayer's widow. Dr. Maskelyne, astronomer-royal, was at the same time requested to improve and correct them as far as possible, so that they might be compiled, and form the basis of a *British Nautical Ephemeris*, or *Almanac*; and to print the same, in order to make the lunar tables of general utility. The first of the series of the *Nautical Almanac* and *Astronomical Ephemeris* was published in 1766, under the superintendence of Dr. Maskelyne. It was published yearly by the Commissioners of the Board of Longitude. The *Nautical Almanac* has been greatly improved, corrected, and extended, under the able superintendence of Mr. Airy, the present astronomer-royal; it is now published four or five years previous to the observations being made at Greenwich Observatory; hence in long voyages the set of tables may be taken out.

In consideration of Mayer having availed himself of Euler's *lunar theory*, the latter received from government £300.

The several methods for finding the longitude are the following:

To find the Longitude by a Chronometer.—Suppose that a chronometer is warranted to measure equal portions of time uniformly, and always indicates Greenwich local time; it is evident that, were this instrument carried to any station on the surface of the earth where also the local time is known, the local times of Greenwich and that place can be compared with each other. If the chronometer be carried to any station on the meridian of Greenwich, the chronometer and local time of the place will always coincide; but if it be carried to any station west or east of the meridian of Greenwich, then the time as shown by the chronometer will be in excess in the former case, but in the latter in defect of the local time of the place; the difference of local times gives the longitude of the place from Greenwich. The time may be converted into distance, at the rate of 15° to one hour. Chronometers can never be made perfect; they require, therefore, to be daily compared with the heavenly bodies in order to ascertain if their motion has been uniform.

To find the Longitude by Lunar Eclipses.—Since an eclipse of the moon is visible to one half of the earth at the same time, this would seem to be an excellent method of finding the longitude. The different steps of the process are—to compute the time at which an eclipse is to happen at the place of observation, and to compare this time with an accurate chronometer showing Greenwich time; or, in the absence of this, the Greenwich time of the happening of the phenomenon must be looked for in the *Nautical Almanac*; or it may

be compared by the observer from the lunar tables. But this method of determining the longitude is rarely used, owing to the difficulty of ascertaining the exact time of contact of the penumbra of the earth's shadow with the moon's limb at the beginning or ending of the eclipse. Sometimes, indeed, two observers of an eclipse at the same place, may differ more than two minutes in noting the time of contact; and hence the error from this cause alone would be about four minutes of time, which would be equivalent to nearly 1° of longitude. It was proposed in the *Philosophical Transactions* of 1786 to diminish this source of error, by observing the contact of the earth's shadow with some remarkable spot on the moon's face. But although this method were more accurate, the unfrequency of lunar eclipses at sea renders the method of little use.

To find the Longitude by the Eclipses of Jupiter's Satellites.—Ever since the discovery by Galileo of Jupiter's satellites the observation of their eclipses by their primary has been used as a method of finding the longitude. Tables of these eclipses were constructed by Galileo; and it was the disagreement of these tables with actual observation that led Roemer to the discovery of the gradual propagation of light. See LIGHT. The first astronomical solution of the great problem of the longitude really dates from the discovery of these *secondaries*, for the tables of their eclipses were framed on scientific principles. The three interior satellites of Jupiter pass through his shadow, and are eclipsed at every revolution; the fourth, or outer one, at times escapes eclipse, grazes the umbra, or is partially eclipsed. The computed times at which the eclipses are to happen at Greenwich Observatory are noted in the *Nautical Almanac*, published three or four years in advance; so that if these tables are in the hands of any one distant from Greenwich, he has but to observe the eclipse, and calculate the time at which it occurs, to find the difference of the local times between Greenwich and the place of observation, and thus ascertain the longitude. The times of immersion and emersion are noted with much greater accuracy than the contact of the moon's limb with the earth's shadow.

But before these eclipses can be observed with accuracy, a telescope of considerable power must be used; and as it is extremely difficult to direct a telescope properly on shipboard, the method is practically useless at sea. But, again, particular care is required in observing; for two observers at the same place, with telescopes of different magnifying powers and apertures, seldom agree within a second or two of each other; hence the mean of the results of immersion and emersion should be taken. But another source of error is, that no two or more observers will agree as to the instant of the total immersion, or of the complete emersion of the satellite; hence the only case in which this method is practically useful in determining terrestrial longitudes is that in which the instant of immersion and emersion are observed with the same telescope, and by the same observer, since in this manner he will find the precise instant of the satellite's opposition to the sun.

To find the Longitude by Signals.—If the difference of longitude between two places be small, it may be easily found by means of the bursting of a rocket, the oxy-hydrogen lime-ball light, or the explosion of gunpowder fired from the one place at a preconcerted time, and observed at the other place; the local times of these places being accurately ascertained, the longitude is known. These artificial signals, when fired from an elevated spot of country, may be seen, when the atmosphere is in a proper state, at distances varying from 80 to above 100 miles. An observer, therefore, distant from the spot at which the rocket or other signal is exposed, has only to observe the time when he sees it, and afterward compare this time with the

time when the rocket was set up, the difference of times giving the longitude of the one place from the other; if at one of the places the Greenwich time corresponding to that of the event is known, the longitudes of the places from that meridian are also known. It is here supposed that the gradual propagation of light leads to no appreciable error in the small distance between the two places.

If the distance between the two places be considerable, and if a rocket sent up at the one place can not be seen at the other place, the longitude of which is required, then a series of signals must be made and noted by observers, placed at stations intermediate to the two extreme places.

Thus, let A and E be the two places, the longitude between which is required; B, C, and D, observers at intermediate stations; w, x, y, z , signal places, and let these places be arranged in the following manner:

A w B x C y D z E.

Before the signals are sent up at the previously arranged hours from w, x, y, z , the local times of the places along the whole line AE are supposed to be accurately known. Let then a signal be sent up at w , and noted at A and B, the difference of times of observation, as noted by the chronometers at those two places, will give the longitude AB. Let, again, another signal be sent up at x , and the time of appearance noted at B and C, then the difference of times, as shown by the chronometers, gives the longitude between B and C; and therefore between A and C. Similar results will be found when signals are sent up from the stations y and z , to be observed at C and D, D and E; and, in this manner, the whole longitude AE between the extreme stations can be found. The longitude found on this principle, and the mode of deducing the most advantageous results from a combination of all the observations, is fully stated by Sir John Herschel in the *Philosophical Transactions*, 1826, on the *Difference of Longitudes of Greenwich and Paris*.

To determine the Longitude by Moon-culminating Stars.—This method consists in finding the increase of the moon's right ascension in the intervals between the passage of the moon over the meridian of Greenwich and over that place whose longitude is required. It is necessary to find the right ascension of the moon's bright limb, and of a star selected on, or as near as possible to, the moon's parallel of declination, and not differing much from her in right ascension at the two meridians; then, the moon's increase of right ascension being known, the difference of longitude is determined.

Let T , for example, be the time when the moon's enlightened limb transits the meridian of any place distant from Greenwich; t the time of passage of a star over the meridian of the same place; let also n be the error of the clock in the course of the day; then $24+n$ will be the interval of time elapsing between two successive transits of the same star, and $24+n: T-t=360^\circ$: the difference of right ascension of the moon's bright limb and the star at the instant of the limb being on the meridian; and if to this the right ascension of the star be added, the right ascension, $=\alpha'$, of the moon's bright limb when on the meridian is determined. Now the proper stars to be observed for this purpose, as well as the right ascension of the moon's bright limb when on the meridian of Greenwich, are given for every day of the year in the *Nautical Almanac*, from which the daily increment of right ascension may be determined. Let a be the right ascension of the moon's bright limb when on the meridian of Greenwich, e the increment of right ascension in the time between two successive transits over the same meridian; then, while the moon, by her relative motion, separates from the meridian of Greenwich by an angle of 360° , its real motion in right ascension is e ; and while it separates by an angle equal to the dif-

ference of longitude, the motion in right ascension is $a'-a''$; and therefore, supposing the change in right ascension uniform, the required longitude $= \frac{a-a''}{a} \cdot 360^\circ$.

Where greater accuracy is required, the difference of longitude corresponding to the increase of right ascension $a-a''$, must be determined by interpolation. This method is considered one of the best which can be adopted for determining the longitude of distant places, when the observer, furnished with a transit instrument, can obtain a landing.—HYMER'S *Astron.*, 1840.

To find the Longitude by the passages of the Moon over the Meridian.—If the sun, moon, and a star be supposed to be on the meridian of Greenwich at the present moment, then the next instant the three bodies will be separated from each other—the star will be found most advanced to the west, the moon least advanced from the meridian, while the sun will occupy an intermediate situation. The meridian itself also leaves these bodies, but will approach them with different degrees of velocity, and reach each of them after certain intervals of time. It will pass the star after the lapse of a sidereal day, or after having described 360° ; it will pass the sun at the end of a solar day, or after having described $360^\circ 59' 8'' \cdot 3$; and it will pass the moon after a time—the sum of 24 hours and the moon's retardation for that time, or after having described an angle—the sum of 360° and the moon's right ascension in 24 hours. This always takes place in the interval between two successive transits of the moon over the same meridian. So also a spectator on a different meridian will notice similar effects, but less in degree, and less proportional to the distance of his from the first meridian. The sun's right ascension will be increased (or the separation of the sun from the star), but less than $59' 8'' \cdot 3$; the moon's right ascension (or the separation of the moon from the star) will also be increased to the spectator, but less than its increase between two successive transits; consequently there will be an excess of increase of the moon's right ascension above that of the sun's, but less than the excess that takes place between two successive transits of the moon over the meridian of Greenwich. Wherefore, since the spectator at the second meridian may compute the respective increments of right ascension of moon and sun that take place between two successive passages of the moon over the meridian of Greenwich; then, since he is also able to compute, by actual observation, the right ascensions of sun and moon at the times of their passage over his own meridian, he has determined the longitude. The spectator may choose the sun and a star, the moon and a star, or the moon and sun; the two former are preferable.—WOODHOUSE'S *Astron.*, 1821.

To determine the Longitude by means of Eclipses of the Sun, or by Occultations of Stars by the Moon.—One of the most exact methods, and at the same time the simplest, for finding the longitude, is by means of solar eclipses and occultations. If the commencement and ending of an eclipse of the sun, or the immersion and emersion respectively of a star from the enlightened and dark limb of the moon or of a planet, be observed, it is only necessary to deduce the true time of conjunction for Greenwich and also for another place of observation; the difference of the times gives the difference of meridians, and therefore also of longitudes. Kepler employed this method, and it is one of the simplest.—KEPLER, *Astron. pars opt.* The only inconvenience of this method is the large amount of calculation required.

To find the Longitude by Lunar Distances; that is, by the distance of the Moon from a Star or the Sun.—This method supposes that the face of the heavens is a dial-plate, the stars marks apparently irregularly

distributed upon it, and the moon the hand movable among them and round the earth as a variable centre. Three things require particular notice about this clock: 1. The intervals of place separating the principal and secondary marks from one another and from the moving hand—the moon. 2. The exact amount of the eccentricity of the earth, the centre of motion of the hand. 3. The proper motion of both moon and earth at any part of their respective paths. When these data are properly known, the time as shown by this clock may be read. The time as pointed out on this dial-plate is generally read at Greenwich Observatory, and tabulated in the *Nautical Almanac*, 4 or 5 years beforehand, for every three hours. But this clock is supposed to be accurately seen by a spectator at the centre of the earth, and consequently, since observers are on the surface, the moving hand being rather near, and the marks immensely distant from the earth, it is evident that this movable hand will be displaced, or undergo a *parallax* with respect to the stars, which must be allowed for, ere the true place is known which she occupies in space, as seen from the centre of the earth. A reduction must also be made to the centre of the earth. The necessary steps for computing the longitude by this method are: (1.) Find by a sextant the distance between a star and one of the moon's limbs; or, between the limbs of the sun and moon; add or subtract, in the former case, the semi-diameter of the moon, and in the latter, the sum of the semi-diameters of sun and moon, which gives the distance of the moon's centre from the star, or that between the centres of sun and moon. (2.) When two observers are making the observations, one should take the above distance, while at the same instant the other takes the altitude above the horizon of the moon and star, or of the moon and sun. In the case of one observer, he must take the altitudes immediately before and after the distance has been found, and allow for the changes of altitude which may have taken place in the intervals between their observations and that of the distance. (3.) The true altitudes are derived from the apparent and observed, by correcting the latter for refraction and parallax; the *apparent* altitude being the observed altitude corrected for the dip of the horizon and instrumental errors. (4.) The observed is also an apparent distance, and must, like the altitude, be corrected for parallax and refraction in order to find the true distance. (5.) Since the true distance is found, the hour, minute, etc., of Greenwich time corresponding to it will also be found by the tables of the *Nautical Almanac*. (6.) The local time of the place of observation is now to be computed from the true and corrected altitude of a star or the sun, the sun's or star's north polar distance, and the latitude. (7.) The difference between this local time and Greenwich time gives the longitude.

To find the Longitude by the Electric Telegraph.—

This beautiful and ingenious application of electricity for recording astronomical observations is the latest method of finding the longitude, and was proposed by Mr. Bond of the Cambridge Observatory, United States. Mr. Airy, of the Greenwich Observatory, has also carried it into effect with great improvements. During the summer of 1847 experiments were made on the electric telegraph connecting New York, Philadelphia, and Washington, for the purpose of determining the differences of longitude between these three cities. A competent observer was stationed at each observatory. A continuous wire connected the three cities, so that telegraph signals might be exchanged between any two of them at pleasure. In some of the first experiments, signals were exchanged between Philadelphia and Washington, but it was found impossible to transmit signals from Jersey City to Washington, the power of the battery being inadequate to that distance. This, however, was remedied on the 29th of July, when 20 clock signals were given at Jersey City, and recorded both at Philadelphia and

Washington; 20 signals were given at Philadelphia and recorded at Jersey City and Washington; and 20 signals were given at Washington and recorded at Jersey City and Philadelphia. Thus the comparison of the three clocks was decisively made in a remarkably short period of time. The success of these experiments amply repaid the first unsuccessful efforts. The difference of longitude between Jersey City and Philadelphia is $40^m 3^s$; and between Jersey City and Washington, $12^m 8^s$; omitting in each case the small fractional part of a second, which was ultimately allowed for. The distance between New York and Washington is 225 miles, and the time required to make a communication pass betwixt these two places was a fraction of a second which can not be measured.

Soon after a system of telegraphic wires was erected on the principal English lines of railway, Mr. Airy had them put in communication with Greenwich Observatory, his object being to give *Greenwich time* on a given day to the United Kingdom. It was at first proposed that a ball should be dropped from the upper part of Greenwich Observatory, so as to touch a spring communicating with all the telegraphic wires in the kingdom, and then, by the striking of a bell, give instantaneously true Greenwich time to Liverpool, Manchester, and all the northern towns. But this method was found impracticable, owing to the non-completion of all the lines with Greenwich. On the 1st of December, 1847, true Greenwich time was communicated directly from the observatory to the several stations of the London and North-Western and Midland lines in connection with it; but to all other stations of these lines special messengers were sent with chronometers indicating true Greenwich time. Hence, since Greenwich time is used over the whole of the United Kingdom, if the local time of any place be known, its longitude from Greenwich is also determined. Since submarine cables connect Greenwich with Brussels and Paris, and these again with the principal cities of Europe, Mr. Airy was very lately enabled to correct the latitudes and longitudes of their observatories. Hence, also, when the submarine cables which are to connect India, Australia, and America, with Greenwich, shall have been completed, the true longitudes of the principal cities of the world will easily be determined.—E. B. See articles LATITUDE and LONGITUDE, EARTH and DEGREE.

Loo-Choo Islands, a group consisting of about 36 islands in the North Pacific Ocean, between Japan and Formosa. They lie between N. lat. 24° and $28^\circ 40'$, and E. long. 127° and 129° . They are small and insignificant, with the exception of Great Loo-Choo, which extends about 60 miles in a north-easterly direction, and has an average breadth of about 10 or 12 miles. This island is entirely encircled by coral reefs, which, however, do not appear above water. Along its centre runs a chain of hills, covered for the most part by forests of pine, and broken at intervals by rupt crags that bear seeming traces of volcanic action. Their slopes in many parts are covered with terraced gardens and fields of grain, and are watered by streams led in artificial channels. The valleys are well watered, fruitful, and covered with a luxuriant vegetation. The villages are almost completely hidden among groves of bananas, bamboos, banyans, and pines. Rows of trees overarch the roads, line the streets of the chief towns, and form a screen in front of the houses. There are large rich fields of rice, intermingled with crops of sugar-cane, wheat, millet, sweet potatoes, plums, oranges, cotton, and tobacco. The principal surface-rock is argillaceous, and is intersected at intervals by peculiar ridges of limestone. The disintegration of the former rock forms the chief ingredient of the rich adhesive soil which is most prevalent in the island. Situate within the range of the trade-winds, Loo-Choo has in general a mild climate. The domestic animals are, geese, ducks,

fowls, pigs, goats, a small species of black ox, and a nimble, and hardy breed of horses. Wild boars abound in the extensive forests. A striking trait in the zoology of the island is the scarcity of birds in the woods.

The dress, customs, but especially the language, of the Loo-Chooans, indicate a Japanese origin. Suspicious of strangers, they are, nevertheless, gentle and hospitable. They are diminutive in stature, and in complexion resemble the Chinese. They have dark eyes and black hair, plaited into a knot on the crown of the head; and the character of the hair-pin determines the sex as well as the rank of the wearer. The women wear single, and the men double hair-pins. Among the higher classes, these articles are made of gold or silver; among the lower, of brass, lead, or pewter. The highest grade of society includes the spies and officers of the government, and also the mechanics and small merchants. Immediately below them are the literary class, who pass the most of their time in smoking tobacco and drinking tea, and are supported by the subordinate rank of field-laborers. The meanest order are the public slaves, possessing no personal freedom, and no civil rights. Subjected from mere infancy to perpetual toil, closely watched by spies, and prevented from all intercourse with strangers, the lower classes are spiritless, uncomplaining drudges, subsisting upon two tenths of the produce they reap from the soil. In the same slavish labor the women also are engaged. The Loo-Chooans of one village seldom intermarry with those of another. Their dead are treated with great respect; and their capacious tombs, built of white limestone, appear at a distance like cottages, checkering the hill-sides. The huts are generally placed in the middle of well-cultivated gardens. Their floors, covered with thick mats, are used both for sitting and sleeping. A great part of the industrial population are engaged in weaving the grass-cloth that forms the ordinary garment, and in turning wooden implements and covering them with lacquer. There are also manufactured tobacco, sugar, and small quantities of salt. Saki, a strong intoxicating liquor, is distilled from rice. All the processes of agriculture, and especially that of irrigation, are carried on with great success. The entire trade of the island is with Japan, and consists chiefly of sugar, saki, and grass-cloth. The government of Loo-Choo seems to consist of an oligarchy of *literati* subject to Japan. Learning is limited to a knowledge of the Chinese character and the Confucian classics, and the principal means of disseminating it is home education. A few regular schools, however, are scattered over the island, and at Napakiang there is an advanced seminary. The Loo-Chooans have no native literature. Their religion is a hybrid between Confucianism and Buddhism. Concerning the history of the island nothing certain is known, but tradition reports that it was once subject to three distinct sovereigns.

The principal sea-port is Napa, or Napa-Keang, situated in latitude $26^\circ 13' N.$, and longitude $127^\circ 36' E.$ The harbor is secure, and the port is now open to American vessels, for the purposes specified in the convention concluded July 11, 1854, and proclaimed March 9, 1855. The government of Japan having virtually disclaimed any jurisdiction whatever over the Loo-Choo Islands, a separate compact was entered into between the United States and the kingdom of Loo-Choo. It is as follows:

"Hereafter, whenever citizens of the United States come to Loo-Choo, they shall be treated with great courtesy and friendship. Whatever articles these people ask for, whether from the officers or people, which the country can furnish, shall be sold to them; nor shall the authorities interpose any prohibitory regulations to the people selling; and whatever either party may wish to buy, shall be exchanged at reason-

able prices. Whenever ships of the United States shall come into any harbor in Loo-Choo, they shall be supplied with wood and water at reasonable prices; but if they wish to get other articles, they shall be purchasable only at Napa. If ships of the United States are wrecked on Great Loo-Choo, or on islands under the jurisdiction of the royal government of Loo-Choo, the local authorities shall dispatch persons to assist in saving life and property, and preserve what can be brought ashore, till the ships of that nation shall come to take away all that may have been saved; and the expenses incurred in rescuing these unfortunate persons shall be refunded by the nation they belong to. Whenever persons from ships of the United States come ashore in Loo-Choo, they shall be at liberty to ramble where they please, without hindrance, or having officials sent to follow them, or to spy what they do; but if they violently go into houses, or trifle with women, or force people to sell them things, or do other such like illegal acts, they shall be arrested by the local officers, but not maltreated, and shall be reported to the captain of the ship to which they belong, for punishment by him. At Tumai is a burial-ground for the citizens of the United States, where their graves and tombs shall not be molested. The government of Loo-Choo shall appoint skillful pilots, who shall be on the look-out for ships appearing off the island; and if one is seen coming toward Napa, they shall go out in good boats, beyond the reefs, to conduct her into a secure anchorage; for which service the captain shall pay the pilot five dollars, and the same for going out of the harbor, beyond the reefs. Whenever ships anchor at Napa, the officers shall furnish them with wood at the rate of 8600 copper cash (43 cents) per 1000 cattles; and with water at the rate of 600 copper cash for 1000 cattles, or 6 barrels full, each containing 80 American gallons."

Loom (Fr. *Metier a tisser*; Ger. *Weberstuhl*), is the ancient and well-known machine for weaving cloth by the decussation of a series of parallel threads, which run lengthwise, called the warp or chain, with other threads thrown transversely with the shuttle, called the woof or weft. See JACQUARD, article, WOOLEN MANUFACTURES.

Lorcha, the name of a coasting vessel used in the Chinese seas. One of those vessels, sailing under British colors, was, in 1856, boarded by the Cantonese, had her flag pulled down, and her crew forcibly carried off. Governor Yeh refused either reparation or apology, and this led to the conflict between Britain and China during the same year.

Lorient, one of the five great naval ports of France, and the principal town in the arrondissement of the same name in the Department of Morbihan, is situated on the northern shore of the Bay of Biscay, where the Rivers Scarf and Blavet, after mingling their waters, fall into the Bay of St. Louis. It is a large and flourishing town, strongly fortified, tolerably well built, but not very clean, standing in an angle between two creeks, one of which forms the naval, and the other the mercantile port. The port, which is large and commodious, is walled off from the town, thereby excluding all view of the water from the inhabitants. It is the seat of a maritime prefecture, of a civil tribunal, of a tribunal of commerce, of a college, and of a school of naval artillery. The dockyard is the first in France for the building and equipment of ships of war: there is accommodation on its slips for the simultaneous construction of 30 ships of war. It has an arsenal, a park of artillery, engineering works, masting-sheds and forges, etc. There is a good trade in sardines, marine stores, iron, wax, honey, etc. The town is quite modern. Founded by the French India Company, in the reign of Louis XIV., in 1664, it was not till the time of the Duke of Orleans that the company took full advantage of the accommodation of Lorient. The greater portion of the town

was then built, and the port fortified. In 1745 it contained 35 frigates, besides a very great number of ships, averaging from 900 to 1200 tons burden. In the comparatively short space of 80 years Lorient had risen to the first rank of towns. On the dissolution of the company in 1770, it was made one of the stations for the French navy. Its population and shipping declined during the unsettled period of the Revolution, but since the peace of 1815 it has been more than restored to its former activity. Population 25,700.

Los Angeles (*the City of the Angels*), capital of Los Angeles county, California, 350 miles south-south-east of San Francisco, and in a direct line 3,000 miles a little south of west from Washington. It contains a large Roman Catholic church, and 1620 inhabitants. This city was founded in 1781, by order of the Viceroy of New Spain, Balilio Frey, Antonio Bucareli y Urza, and is situated on the right bank of the Porcu-neula River, which copiously waters the highly fertile plain on which the city stands. Invited by a genial climate, the inhabitants have converted this plain into a delightful garden, covered with all sorts of native fruits, but especially the vine, which is cultivated with care and extraordinary success (the product of 1852 amounted to 2,250,000 pounds). This valley, famous for its wines and liquors, contains the missions of San Juan Capistrano, San Gabriel, and San Fernando, which but a few years since constituted the richest establishment in California, and numbered very nearly 500,000 head of cattle.

Lotteries, in their highest application, are institutions for raising the revenue of the country by granting to those who voluntarily contribute the chance of obtaining a reversion of part of the money collected. This reversion is determined by lot. The first mentioned in English history began drawing at the western door of St. Paul's Cathedral, January 11, 1569, and continued, day and night, until May 6 following. Its profits were for repairing the fortifications on the coast of England, and the prizes were pieces of plate. The first lottery mentioned for sums of money took place in 1630. Lotteries were established in 1693, and for more than 130 years yielded a large annual revenue to the crown. The Irish state lottery was drawn in Dublin in 1780. All lotteries were suppressed in France by a decree of the National Convention, November 15, 1793. They were abolished in England 1826; and an act was passed imposing a penalty of £50 for advertising foreign or any lotteries in the British newspapers, 1836. Abolished in Bavaria by unanimous vote of the deputies, October 19, 1847. They have long been abolished in New England: in New York they were prohibited about 1830. In nearly all the States there is a penalty against lotteries not specially authorized by the legislatures. The practice may be traced back to the Romans, who were accustomed, at least in the days of the empire, to enliven their festivals with the distribution of tickets, uniform in appearance, but entitling the holders to receive articles of various value. Instead of granting largesses to the leaders of the Plebs, the Emperor Augustus frequently distributed his gifts on the same principle; and Helio-gabalus has the merit of devising in sport a plan frequently resorted to in fraud to avoid the penalties against lotteries in England, of making prizes really worthless take the place of blanks. In the middle ages the same practice prevailed at the banquets of feudal princes, who distributed their presents economically, and without the fear of jealousy, by granting lottery tickets indiscriminately to their friends. The practice soon descended to the merchants; and in Italy, in the 16th century, this became a favorite mode of disposing of their wares. In 1530 the "Lotto" of Florence was established for the necessities of the State, and the example was quickly followed throughout Europe. The first lotteries with numbered tickets were instituted at Genoa. Mercantile lotteries were

established in France, under Francis I., in 1539, and a tax levied on each ticket; but these were supplanted in 1660 by lotteries of money, under the direct control of the king. The first lottery established in England was drawn in 1569. It consisted of 40,000 lots, which were sold at 10s. each. The prizes were pieces of plate; and the profits were devoted to the repairs of certain harbors in the kingdom. The printed plan of this scheme is still in possession of the Antiquarian Society of London. In 1612 a lottery was granted in behalf of the Virginia Company; and in 1680 the same privilege was accorded to a contractor who undertook to supply London with water. From this time forward the spirit of gambling increased so rapidly, and grew so strong, that, in the reign of Queen Anne, private lotteries had to be suppressed as public nuisances. The first parliamentary lottery was instituted in 1709; and from this period till 1824 the passing of a lottery bill was in the programme of every session. Up till about the close of the 18th century the prizes were generally paid in the form of terminable, and sometimes of perpetual, annuities. Loans were also raised by granting a bonus of lottery tickets to all who subscribed a certain amount. This gambling in annuities, however, despite the restrictions of an act passed in 1793, soon led to an appalling amount of vice and misery; and in 1808 a committee of the House of Commons urged the suppression of this ruinous mode of filling the national exchequer. In October, 1826, the last public lottery was drawn in Britain. In France, State lotteries have been abolished, but they still exist in most of the continental States; and although demonstrably a source of loss to those who embark in them, they are upheld as a very ready mode of procuring money from the poor, the miserly, and the adventurous. The Hamburg lottery affords the most favorable representation of the system, as in it all the money raised by the sale of tickets is re-distributed in the drawing of the lots, with the exception of 10 per cent. deducted in expenses and otherwise. In the United States, lotteries were established by Congress in 1776, but with the exception of the southern States, heavy penalties are now imposed on persons attempting to establish them. Private lotteries are now illegal at common law in Great Britain and Ireland; and penalties are also incurred by the advertisers of foreign lotteries. Some years ago it became common in Scotland to dispose of merchandise by means of lotteries; but this is specially condemned in the statute 42d Geo. III., c. 119. An evasion of the law has been attempted by affixing a prize to every ticket, so as to make the transaction resemble a legal sale; but this has been punished as a fraud, even when it could be proved that the prize equaled in value the price of the ticket. This decision rested upon the plea, that in such a transaction there was no definite sale of a specific article.

In 1844 art-unions began to be established in Britain; and as the principle on which they are founded involves that of the lottery, their operations, which are in reality illegal, were immediately suspended by order of government. In the following year, however, an act was passed to indemnify those who had embarked in them for the losses which they had incurred by the arrest of their proceedings; and since that time they have been tolerated under the eye of the law without any express statute being framed for their exemption. —E. B.

Lotus. The lotus (*Nympha lotus*) is a native of the lakes of the Cashmere, and its stems serve as an article of food. In autumn, after the plate of the leaf has begun to decay, the stem has arrived at maturity, and being boiled till tender, furnishes a wholesome, nutritious diet, which is said to support 5000 persons in Cashmere for nearly eight months in the year. This plant would probably succeed well in the muddy bottoms of the coves, creeks, and sloughs of our lakes and

streams; and, if not relished as human food, doubtless its products would serve to nourish animals.—*Patent Office Rep.*, 1855.

Lough, an Irish term, synonymous with the Scotch *loch*, but not with the English *lake*: for loch and lough are applied to designate arms of the sea, as well as collections of fresh water, which lake is not.

Louis d'Or, a French coin, first struck in the year 1640, under the reign of Louis XIII. By the French mint regulations it was at length made equal to 24 livres, or £1 sterling. This, however, was underrating it as compared with silver; and hence, as every one preferred paying their debts in the over-valued coin, silver became the principal currency of France—the gold coins being either sent to the melting-pot or exported. In Great Britain the process was reversed, gold having, for a long period, been overvalued by their mint.

Louisiana, one of the southern United States, lies between 29° and 35° N. lat. It is 240 miles long from north to south, and 216 broad, containing 41,346 square miles. Population in 1810 was 76,566; in 1820, 153,407; in 1830, 215,575; in 1840, 352,411; and in 1850, 511,974. The State is divided into 47 parishes. Robert de la Sale, when he reached the mouth of the Mississippi (1682), introduced the name *Louisiane*, in honor of the great king, as the name of the country along the great river, "from the Illinois to the Gulf of Mexico." (CHARLEVOIX, tom. i.) Many other points and locations were vowed round the same gulf to the same name, king and his saint. La Sale (1685) vowed to the saint and to the king "the Bay of St. Louis" (Matagorda Bay), discovered by him on the coast of Texas. When Iberville, on the 12th of April, 1699, discovered that little bay opposite Cat Island, on the coast of the continent, he introduced this name again into the Mississippi country, by naming the harbor "*La Baye de St. Louis*." In the year 1701 Mr. Bienville, when he evacuated Billoxi, and removed the French head-quarters to Mobile Bay, called his fort there "*Fort de St. Louis*," and this name, Fort St. Louis, then designated, for more than 20 years, the central settlement or capital of the French Mississippi colony. It is curious that the name "*Louisiane*" seems not to have been much used before 1712. We do not find it, for instance, a single time mentioned in the *Memoirs* of M. DE SAUVOLLE, written in this colony in the beginning of the 18th century. In the year 1712 King Louis XIV. adopted officially the name "*Louisiane*" for that province, which seemed now promising and important enough for such a grace. He pronounces that the countries at the mouth of the Mississippi shall henceforward be called "*La Province de la Louisiane*." He at the same time changes also the name of the Mississippi, and says that it shall at present be called "*Riviere de St. Louis*" (the St. Louis River). The French extended the name of Louisiana over the whole Mississippi valley, between the Alleghany Mountains, the Lakes of Canada, Mexico, and the Rocky Mountains, and south they went as far with their pretensions as the Rio Bravo, including all Texas. All the old French maps go with their "*Louisiane*" as far south as the Rio Bravo. On some maps even the peninsula of Florida was called "*La Peninsule de Louisiane*," so that, according to these French pretensions, the name "*Louisiane*" comprehended the whole coasts of the Gulf of Mexico which belong now to the United States.

The Spaniards, on the other hand, went with their name "*Mexico*" as far as Red River and the western shore of the Mississippi, and they kept in Texas their ground. They also kept up their old dominion in the Floridas; so that, in time, the name "*Louisiane*" was on the French maps more contracted. When the Spaniards acquired (1763) from France the dominion of Louisiana, they retained that name, changing it only to "*Louisiana*," or sometimes also to "*Lusiana*,"

and even to "Luciana." They put the eastern limit of their Mexican provinces and of Texas at the River Mermentau, quite near to the Mississippi Delta; and the western limit of the Floridas was, as well at the time of the English dominion in the Floridas (1763-1783) as after the retrocession of these provinces to Spain (1783), considered to be at the easternmost branch of the Mississippi (Riviere, Iberville and the Lakes Pontchartrain, etc.); so that during this time (1763-1800) the name "Luciana" comprised only a very small part of the coasts of the Mexican Gulf. When the United States acquired the dominion of Louisiana (1802) this name was at first quite extinguished on the shores of the Gulf. The whole southern part of old Louisiana was called "The Territory of New Orleans." The old name was, however, revived again in the year 1812, when a part of the old French colony was admitted into the Union under the name of the "State of Louisiana." After the final settlement of the boundaries of this State, the name Louisiana comprised all the shores between the mouth of Pearl River to the east and that of Sabine River to the west, the whole Mississippi Delta, and on both sides a little more. We may remark that the orthography of the name Louisiana, which we have adopted, is half Spanish, half French. Purely French it ought to be "Luisiane," and purely Spanish, "Luisiana."—J. G. KOHL.

Physical Features, etc.—Below the mouth of Red River, the Mississippi divides into several branches or outlets, which, diverging from each other, slowly wend their way to the Gulf of Mexico, and divide the south-west part of the State into a number of large islands. The western of these outlets is the Atchafalaya, which leaves the main stream at the mouth of Red River, and inclining eastward, flows into Atchafalaya Bay, in the Gulf of Mexico. About 128 miles below the Atchafalaya is the outlet of Plaquemine, the main stream of which unites with Atchafalaya, but other portions of it intersect the country in different directions. 31 miles below the Plaquemine, and 82 above New Orleans, is the outlet of La Fourche, which communicates with the Gulf of Mexico by two mouths. Below the La Fourche, numerous other small streams branch off from the river at various points. On the east side of the Mississippi the principal outlet is the Iberville, which communicates with the Gulf of Mexico through Lakes Maurepas, Pontchartrain and Borgne. The whole territory between the Atchafalaya on the west, and Iberville, etc., on the east, is called the Delta of the Mississippi, from its resemblance in shape to the Greek letter of that name. A large extent of country in this State is annually overflowed. The alluvial margin along the Mississippi has a breadth of from one to two miles, and is of great fertility. To prevent the river from inundating the valuable tracts in the rear, an artificial embankment has been raised on the margin of the river, called the Levee. On the east side of the river this embankment commences about 40 miles below New Orleans, and extends up the river for a distance of 180 miles. On the west side it continues with little interruption to the Arkansas line. Along this portion of the river there are many beautiful and finely-cultivated plantations, and a continual succession of pleasant residences. The south-western part of the State consists of sea marsh on the margin of the Gulf, but further inland of extensive and fertile prairies, which contain many flourishing settlements. The surface is elevated from 10 to 50 feet above high tide. The country between the Mississippi, Iberville, and Pearl Rivers, in its southern parts, is generally level and highly productive in cotton, sugar, corn, rice, and indigo. The northern part has an undulating surface and a heavy natural growth of white, red, and yellow oak, hickory, black walnut, sassafras, magnolia, and poplar. In the north-western part, the Red River, after entering the State by a

single channel and flowing about 80 miles, spreads into a number of channels, forming many lakes, islands, and swamps, over a space of 60 miles long and 6 broad. The bottoms on the river are from 1 to 10 miles wide, and very fertile. The timber is willow, cotton-wood, honey-locust, pawpaw, and buckeye; on the rich uplands, elm, ash, hickory, mulberry, black walnut, with a profusion of grape vines. On the less fertile and sandy uplands of the State are white pitch and yellow pines, and various kinds of oak. There were in this State in 1850, 1,590,025 acres of land improved, and 3,939,018 of unimproved land in farms. Cash value of farms, \$75,814,398; and the value of implements and machinery, \$11,576,938.

Live Stock.—Horses, 89,514; asses and mules, 44,849; milch cows, 105,576; working oxen, 54,968; other cattle, 414,798; sheep, 110,333; swine, 597,301. Value of live stock, \$11,152,275.

Agricultural Products, etc.—Wheat, 417 bushels; rye, 475; Indian corn, 10,266,373; oats, 89,637; buckwheat, 3; peas and beans, 161,732; potatoes, 95,632; sweet potatoes, 1,428,453; rice, 4,425,349 lbs. Value of products of the orchard, \$22,359; produce of market gardens, 148,329. Pounds of butter made, 683,069; of cheese, 1,957; sugar, hhd's, 226,001; maple sugar, 255 pounds; molasses, 10,931,177 gallons; bees' wax and honey, 96,701 pounds; wool, 109,897; cotton, 178,787; silk cocoons, 29; hops, 125; tobacco, 26,878; hay, 25,752 tons; clover seeds, 2 bushels; other grass seeds, 97 bushels; and there were made 15 gallons of wine. Value of home-made manufactures, 139,232; of slaughtered animals, \$1,458,990.

Rivers, etc.—The Mississippi River forms the boundary of the State for a considerable distance, and in its lower part runs wholly within the State, and enters the Gulf of Mexico by several channels. It is navigable for vessels of the largest size. Red River enters the State near the north-west corner, and passes through in a south-east direction, discharging a vast amount of water into the Mississippi, 236 miles above New Orleans. The Washita runs in a south direction in the north part of the State, and enters Red River a little above its junction with the Mississippi. Bayou La Fourche and Atchafalaya are large outlets of the Mississippi. The other rivers and streams are the Black, Tensas, Sabine, Calcasieu, Mermanteau, Vermilion, Teche, Pearl, Amite, Iberville, etc.

Manufactures.—There were in this State in 1850, 8 establishments with a capital of 225,000, employing 347 persons, and making 1,570 tons of castings, etc., valued at 312,500; 96 flouring and grist mills, 120 saw mills, 16 tanneries, 47 printing offices, 60 newspapers—11 daily, 6 tri and semi-weekly, 37 weekly—and one monthly publication; aggregate number of copies issued annually, 12,416,224. Capital invested in manufactures, \$5,304,924; value of manufactured articles, \$7,045,814. On the 1st of January, 1856, there were 7 railroads, with 111 miles of track finished and in operation.

The principal places in the State are Baton Rouge, the capital, New Orleans, Jackson, St. Francisville, Opelousas, Grand Coteau, Alexandria, Natchitoches, and Shreveport. There were, January 1st, 1853, 7 banks in the State, with an aggregate capital of \$12,000,000. Tonnage, same year, 156,273 tons. Total value of exports of American and foreign produce, 1852, \$49,058,885. Value of imports, \$12,057,724.

Louisiana was first explored by the French, and received its name in 1682 from M. La Salle, in honor of Louis XIV., and a settlement was attempted in 1684, but failed. In 1699 a more successful attempt was made by M. Iberville, who entered the Mississippi and founded a colony. His efforts were followed by Crozat, who held the exclusive trade of the country for a number of years. About 1717 he transferred his interest to a chartered company, at the head of which

was the notorious John Law, whose national bank and Mississippi speculation involved half the French nobility. In 1731 the company resigned the concern to the crown, who, in 1762, ceded the country of Louisiana to Spain. In 1800 Spain re-conveyed the province to France, from whom, in 1803, the United States

purchased the entire territory for \$15,000,000. The portion now included in the State formed a constitution, and was admitted into the Union in 1812. A second constitution was adopted and went into operation in 1845, and the third and present one was formed and adopted in 1852.

FOREIGN COMMERCE OF THE STATE OF LOUISIANA, FROM OCTOBER 1, 1820, TO JULY 1, 1856.

New Orleans is the principal port on the Mississippi, and the natural dépot for the commerce of the great central valley. It is situated on the left bank of the river, 100 miles from the Gulf of Mexico, in lat. 29° 58', and long. 90° 7'. Its site is low and marshy, and in the summer and fall very sickly. Two railroads connect it with Lake Pontchartrain, and thence steamboats connect with Mobile, etc. It communicates northward by the New Orleans, Jackson, and Great Northern Railroad, and westward by the New Orleans, Opelousas, and Great Western Railroad. Its commerce by river is carried on by steamboats in constant succession, and these traverse the great river and tributaries for thousands of miles. By these means it receives and distributes its merchandise. The average value of produce received from the interior, is about \$120,000,000. Its foreign trade is co-extensive, and with regard to cotton and sugar, it is the first port of the Union. The depth of water in the river, opposite New Orleans, is at a medium of 70 feet, and it maintains soundings of 30 feet until within a mile of its confluence with the sea. The river has four principal passes. The tonnage of the port in 1856, was 163,308 tons.

Lowell, an important manufacturing town in Middlesex county, Massachusetts, on the right bank of the Merrimack River, at its junction with the Concord, 25 miles north north-west of Boston. Although the site of the town has considerable inequality of surface, its streets are regularly laid out, and intersect each other at right angles. The private residences are spacious, and many of them elegant buildings. Among the

public edifices, the chief are the court-house, the mechanics' hall, a sick hospital for operatives, and a market-house. The literary institutions of the town are very efficient, and have been of considerable service to the community. The Mechanic Association, incorporated in 1825, has a valuable library of about 6000 volumes, and a scientific apparatus; while the city school library contains 9500 volumes, and is open to all on a small yearly payment. The great advantage which Lowell enjoys for a manufacturing town is derived from a descent of 30 feet made by the Merrimack, and known as the Pawtucket Falls, which, by means of canals and locks, provides abundance of water-power. Besides these there is a spacious reservoir, placed on an elevation eastward of the city, which furnishes an immense supply of water at all times in case of fire. The principal goods manufactured here are cotton, wool, and iron. The first is made into cotton cloth and calico; the second into carpets, cloth, and coarse stuffs; and iron into machinery and wire fences. Besides these, however, bleaching is carried on extensively, as well as the preparation of dyes, glue, and other essentials of the cotton and wool manufactures. In January, 1855, there were 12 manufacturing companies in Lowell, owning 52 mills, and working 371,838 spindles, and 11,407 looms. The aggregate quantities produced every week were 2,230,000 yards of cotton cloth, 30,000 yards of woolen cloth, 25,000 yards of carpeting, and 50 rugs. In the same year, \$14,500,000 of capital was invested in the whole manufactures of the place; while the number of hands employed amounted to

8723 females, and 4542 males. Every attention is paid by the mill-owners to the health and morality of their operatives. One of the best proofs of the general good conduct of the mill-workers here is shown in the large amounts deposited by them in the savings-bank; and also in the interest they take in the literary and scientific associations connected with the factories.

In the rapidity of its growth, and in the extent of its manufactures, it stands pre-eminent; it has attained its present position altogether from the extent of its manufacturing facilities. A tract of 400 acres, constituting the most central part of the present city, was laid out in 1821. It was purchased for \$100,000, and the owners were incorporated the following year, under the title of *Merrimack Manufacturing Company*, and the first mill erected. Population 1820, about 200; 1830, 6,477; 1836, 17,330; 1840, 20,796; 1850, 33,383; and in 1854, 40,000. In 1834, Belvidere village was added to it, making a territory of nearly 5 square miles, and in 1836 it was incorporated as a city. Lowell lies on the right bank of Merrimack River, at the junction of Concord River, and at the intersection of several lines of railroads. It was originally known as Pawtucket Falls. The water power is very extensive, and easily available. A canal, 100 feet wide, 15 feet deep, and $1\frac{1}{2}$ miles in length, supplies the factories with water, taken from the Concord River, at Pawtucket Falls. The entire descent is 31 feet. The proprietors of the "Locks and Canals Company," acting under a charter granted in 1792, with a capital of \$600,000, supplies the water power to the different manufacturing establishments. The *Merrimack Manufacturing Company*, was chartered in 1822, has a capital stock of \$2,000,000; with 5 cotton factories, with 67,965 spindles, and 1,920 looms, employs 1,600 males, and 645 females; manufactures 18,000 yards of prints and sheetings annually. Connected with this Company is an extensive print works. The *Hamilton Manufacturing Company*, chartered in 1825, with a capital stock of \$1,200,000, has 3 cotton factories, with 36,228 spindles, and 1,002 looms, employs 875 females, and 360 males; manufactures 10,000,000 yards of prints, dannels, and sheetings annually. It also has an extensive print works. The *Appleton Company* was incorporated in 1828, with a capital of \$600,000; has 2 cotton factories, with 17,920 spindles, and 538 looms; employs 480 females, and 120 males; manufactures 6,500,000 yards sheetings and shirtings annually. The *Lowell Manufacturing Company* was chartered in 1828, with a capital of \$1,300,000; has a cotton factory, 7,142 spindles, 244 looms, and a carpet factory, 4,300 spindles, and 80 looms, the whole employing 500 females, and 225 males; manufacturing 4,940,000 yards rugs, carpeting, and cotton cloth, annually. The *Middlesex Manufacturing Company* was chartered in 1830, with a capital of \$1,000,000; has 3 mills, with 13,000 spindles, 45 broadcloths, and 375 cassimere looms, and 3 dye-houses, employing 950 females, and 820 males; manufacturing 950,000 yards of broadcloths and cassimeres annually. The *Suffolk Manufacturing Company*, chartered in 1830, with a capital of \$600,000, has 2 factories.—See STATISTICS OF MASS., 1855, for further items.

Lowering, among distillers, a term employed to express the debasing the strength of any spirituous liquor by mixing water with it. The standard and marketable price of these liquors is fixed in regard to a certain strength in them called *proof*; or, that strength which makes them, when shaken in a phial or poured from on high into a glass, retain for some time a froth or crown of bubbles. In this state spirits consist of about half pure, or totally inflammable spirits, and half water; and if any foreign or home spirit be exposed for sale and found to have that proof wanting, scarcely any body will buy it until it has been distilled again and brought to the proper strength; and if it be above that strength the proprietor usually adds water

to bring it down to the standard. There is another kind of lowering among the retailers of spirituous liquors to the vulgar, by reducing it under the standard proof. Whoever has the art of doing this without destroying the bubble-proof, which is easily done by means of some addition which gives a greater tenacity to the parts of the spirits, will deceive all who judge by this proof alone. In this case, the best way to judge of liquors is by the eye and the tongue, and especially by the instrument called the hydrometer.

Lubber, a contemptuous name, given by sailors to those who know not the duty of a seaman. *Lubber's Hole* is the vacant space between the head of a lower mast and the edge of the top. It is so termed from a supposition that a lubber, not caring to trust himself up the futtock shrouds, will prefer that way of getting into the top.

Lubec, one of the free cities of northern Germany, and nominally the chief of the Hanse Towns, is the capital of a small territory, is situate on a gentle ridge between the rivers Trave and Wakenitz, 10 miles from the mouth of the former at Travemünde, and 36 miles north-east of Hamburg. Lubec is the capital of the four free or Hanseatic towns, and the seat of their supreme court of appeal. The court consists of six members, one of whom is chosen by each of the free towns; Frankfort and Bremen nominate the fifth; while the sixth is named alternately once by Lubec and twice by Hamburg. The president is chosen annually by the senates of the four towns. The present city of Lubec was founded in 1143 by Adolphus II., Count of Holstein and Schaumburg, by whom it was ceded in 1158 to Henry Duke of Saxony, surnamed the Lion. In 1226 it was made a free imperial city by Frederic II. At this time it was an important commercial city, and was rapidly increasing. In 1241 it entered into treaty with Hamburg, and thus laid the foundation of the Hanseatic League, of which it became the head about 1260. For four centuries Lubec continued in a flourishing condition, and is said to have at one time contained 200,000 persons. After the dissolution of the League, which took place in 1632, it gradually fell into decay, and has never again attained its former importance. After the battle of Jena in 1806, the Prussian general Blucher, with the remains of his army, took refuge in Lubec, which was then stormed by the French, and sacked and pillaged for three days. In 1810 it was annexed to the French empire, and so remained till after the battle of Leipzig in 1813, when it was restored to its political independence, and subsequently joined the German Confederation as a free city. It has one vote in the full council; but in the select council it has only one in conjunction with the other free towns. Lubec is one of the most picturesque old towns in Germany. Its streets are generally straight and regular, and its public buildings, which are mostly of brick, have undergone little change since the 15th century. Many of the houses are in the old-fashioned style, with their quaint gables toward the street; and not a few of them are remarkable for the richness of their architecture. The old ramparts of the town have been laid out in public walks. The finest building in Lubec is the Marienkirche, founded in 1304. It is in the pointed Gothic style, constructed almost entirely of brick, and surmounted by two towers with spires rising to the height of 430 feet. It has three naves; the roof of the centre one rising to the unusual height of 134 feet. It contains numerous monuments and paintings—the latter by Holbein, Vandyck, Overbeck, etc. The "Dance of Death," dated 1463, is remarkable as representing the costumes of the period. This church possesses a very fine organ, and has also a curious old astronomical clock, constructed in 1405. The Domkirche, or cathedral, built between 1170 and 1341, is almost entirely of brick, and has two towers surmounted by spires 300 feet high. It contains numerous

monuments to bishops and others connected with Lubeck. The screen of the choir is a master-piece of wood-carving of the early German school. In one of the side chapels is a painting by Memling representing the Passion of our Saviour in 23 distinct groups. The town-house, on the market-place, is a curious old Gothic brick building, completed in 1517. Here in ancient times deputies from 85 cities in Germany composing the Hanseatic League, held their sittings. The educational and charitable institutions are numerous; besides which there are an exchange, mint, arsenal, public library with 37,000 volumes and a theatre.

Lubeck is still a place of considerable commercial importance. It trades largely with Hamburg by means of the Trave and a canal, and also with Russia, Denmark, Sweden, and Finland. A branch line connects it with the Hamburg and Berlin railway. Regular steam communication is kept up with Copenhagen, Stockholm, and St. Petersburg. Vessels drawing not more than nine feet of water can come up to the town, but larger vessels load and unload by means of lighters at Travemünde, between which and Lubeck small steamers are constantly plying. The chief exports are—corn, cattle, wool, iron, and timber; imports—wines, silks, cottons, hardware, colonial products, and dye-stuffs. In 1855, 972 vessels, carrying 55,266 lasts, entered; and 958 vessels, carrying 54,246 lasts, left the port. The manufactures are numerous, but not large or important. Among the chief are woolen, linen, cotton, and silk goods; tobacco, soap, paper, playing-cards, musical instruments, hats; and iron, copper, and brass wares.

Its trade is principally carried on with the Baltic States, to which it exports corn, cattle, wool, fish, iron, and timber. Its imports comprise wines, silks, cottons, hardwares, and other manufactured goods; also colonial produce, dye-stuffs, etc. The territory belonging to Lubeck is about 20 miles in length, by 3 miles in breadth, containing a population of 54,166, chiefly employed in the rearing of live stock. In 1852 there entered the port of Lubeck 2086 vessels, measuring 262,724 tons, viz.: sailing vessels, 1699, of an aggregate tonnage of 170,096 tons, and 387 regular steam-packets, of an aggregate of 92,628 tons. Russia holds the first rank in the trade of Lubeck. Of the whole number of vessels entered in 1852 (2085), there were under the Russian flag 456 vessels, with an aggregate of 85,730 tons. The total imports into this port in 1852 reached, in weight, 122,000,000 kilos. (2·20 lbs. each), viz.: by sea, 94,000,000 kilos.; by land, 28,000,000 kilos. This was a falling off from the preceding year of 10,000,000 kilos.

Among the imports of 1852 were: tobacco, 1,049,132 kilos.; cotton, drugs, and dye-stuffs, 4,034,849 kilos.; coffee, 2,291,526 kilos.; sugar, 4,278,066 kilos.

The total imports in 1851 amounted to 132,333,000 kilos.; but the increase of 10,000,000 kilos. was attributable to the heavy stock of material introduced by those engaged in the construction of the railroad between Lubeck and Hamburg. A comparison with the preceding years of regular trade will show a steady, though a gradual increase. In 1850 the total imports reached 120,000,000 kilos., or 2,000,000 less than in 1852.

The general imports of Lubeck are thus classified: *Manufactures*.—Including, principally, liquors, watches, jewelry, hardware, gunpowder, piece-goods, glass-ware, 13,954,580 kilos. *Colonial, or trans-Atlantic Merchandise*.—Consisting of coffee, cotton, drugs, dye-stuffs, sugar, tobacco, and tea, 11,708,795 kilos. *Animal Substances*.—Consisting of butter, cheese, wax, oils, wool, peltry, silk, 2,827,453 kilos. *Metals*.—Chiefly of iron and copper, 6,121,736 kilos. *Miscellaneous*.—Including salted fish, tallow, grains, timber, pot-ashes, etc., 88,424,913. Total, 123,037,477 kilos. Manufactures represent 11½ per cent., colonial, or

trans-Atlantic merchandise 9½ per cent., metals 5 per cent., and all other imports 74 per cent. of the total trade.

Statement showing the Steam Navigation between Lubeck and the Baltic Ports, from 1849 to 1852.—1849.—Between Travemünde (the port of Lubeck) and Copenhagen—voyages, 67; passengers, 1955; receipts, 152,046 francs. 1850.—Between Travemünde, Copenhagen, and Gothenburg—voyages, 61; passengers, 2858; receipts, 194,738 francs. 1851.—Between Travemünde, Copenhagen, and Gothenburg—voyages, 37; passengers, 3,415; receipts, 137,884 francs. 1852.—Between Lubeck, Copenhagen, and Gothenburg—voyages, 20; passengers, 3061; receipts, 114,360 francs.

The merchant marine of Lubeck in 1853 consisted of 65 vessels, of 13,300 tons aggregate, viz., 60 sailing vessels, of 11,826 tons, and 5 steamers. The once extensive and flourishing trade of Lubeck had dwindled down to the mere shadow of its former greatness. The tardy communication with Hamburg (a city on which it depends almost exclusively for its commercial activity) by canal navigation, contributed much to depress its commercial enterprise; and, hence, its merchants have, for a long period, been strenuous and unremitting in their efforts for the construction of a railroad that would connect them with that city. Denmark, however, jealous of any enterprise that would be likely to create a rival for the trade of Kiel, which town is also connected by railroad with Hamburg, long refused permission to construct the contemplated railroad across any portion of its territories. The difficulties were, however, adjusted, the road constructed, and during the past few years the trade of Lubeck has risen to considerable importance. In 1850, before the connection by railroad was established, the merchandise which passed between the two cities amounted to but 26,000 quintals of 106·85 lbs. each; in 1853, after the railroad was opened, it ascended to 267,380 quintals, viz., 89,575 Hamburg merchandise, and 177,805 foreign merchandise, forwarded *via* Hamburg. The United States has no direct trade with Lubeck, such of its staples as reach that market being supplied either from Hamburg or Altona, chiefly the former.

The tariff is that of December 5th, 1851.

Monies.—1 marc = 16 schillings Lubeck courant = 28·79 cents.

Weights and Measures.—1 ship-pound = 2½ cwt. of 112 lbs. English, each = 280 lbs. 1 lis-pound = 14 lbs.

Duties on Imports.—All goods, whether of foreign or home production, pay ½ of 1 per cent. ad valorem, as given in the invoices, except the following articles, which are free of import duties: Transit goods re-exported within three months after entry; effects of travelers; household furniture used; wool brought for the Lubeck fair, and delivered at the wool warehouse; goods on board of vessels not consigned to Lubeck; wares on board of ships entering the port of Travemünde in distress.

None but citizens have the privilege of clearing goods in the custom-house; American vessels, however, are exempt from this regulation.—*Com. Rel. U. S.*

Lucia, St., one of the British West India Islands, Windward group, lying about 30 miles north of Martinique, in lat. 13° 50' N., long. 60° 58' W. It is 32 miles in length from north to south, by 12 in extreme breadth, and has an area of about 235 square miles, or 150,000 acres. It is longitudinally divided by a chain of mountains, generally from 1200 to 1800, and in some cases 2000 feet high, densely clothed with the finest timber. These are of volcanic formation, and assume the most fantastic forms, abounding in deep chasms and pointed eminences. From either side of this chain branches of lesser altitude go off toward the coast, forming plains and valleys of various sizes. At

its southern extremity are two mountains of volcanic origin, called the Sugar Loaves, which rise nearly perpendicularly from the sea, in the form of parallel cones, to the height of about 2700 feet; they are covered with evergreen foliage, and mark the entrance into the deep and beautiful Bay of Soufrière. The valleys throughout the island, as well as the plains upon the coast, are fertile, being well watered by numerous streams, and are under good cultivation. The island is divided into two territories—Basseterre, the low or leeward portion, which is well cultivated, and the most populous, though the prevalence of stagnant waters and morasses renders the climate very unhealthy; and Capisterre, the high or windward territory, which is also very unhealthy, but is becoming less so as the wood on the high lands is being cleared away. The climate is very moist, as the trees on the mountains attract the clouds, and hence render the island subject to frequent and heavy rains for 9 or 10 months in the year.

The extent of land under each description of crop in 1854, and the three preceding years, was:

	1851.	1852.	1853.	1854.
	Acres.	Acres.	Acres.	Acres.
Canes.....	3,015	3,563	3,489	3,290
Coffee.....	155	187	180	97
Cocoa.....	184	109	89	87
Provisions....	1,013	1,136	2,423	1,154

The quantities of various articles produced in each of the above years were:

	1851.	1852.	1853.	1854.
Sugar.....lbs.	6,691,800	7,130,560	6,739,700	7,414,100
Coffee..... "	18,620	25,983	6,051	10,250

Sugar, Mus.....cwt.	59,242	41,463	41,462	6
Other articles.....	4,700	300	2,699	2,702
Total value....	£255,886	£46,004	£6,668	£8,164

The total value of imports in 1854 (principally articles of British manufacture, flour, dried fish, butter, live stock, lumber, salted meat, olive oil, wine, rice, and tobacco) was £96,309; being £41,996 from the United Kingdom, £27,880 from British colonies, and £26,433 from foreign States. The nett amount of the general revenue in 1854 was £14,098; being, custom duties on imports, £6482; on tonnage, £744; assessed and other taxes, £6872. The nett expenditure for that year was £13,565. The total population in 1854 was 24,123, of whom 480 were male and 517 female whites, 11,081 male and 12,095 female persons of color. The chief town of the island is Castries, which contains about 3000 persons. St. Lucia was first colonized by English settlers in 1639, but these were soon after driven off by the Caribs. About 1650 the French effected a settlement, and from that time to 1803, when it was finally captured by the English, it belonged alternately to France and England. The government is administered by the commanding officer of the troops, a lieutenant-governor, and an executive council, consisting of the colonial secretary, the attorney-general, and the second military officer. There is also a legislative council, composed of five official and five non-official members, in which the colonial secretary and attorney-general have seats and votes, and of which the commanding officer is president. The

laws of St. Lucia, except in so far as they have been altered by orders of council, are the laws of France, antecedent to the Code of Napoleon.

Luff, the order from the pilot to the steersman to put the helm toward the lee side of the ship, in order to make the ship sail nearer the direction of the wind. Hence, luff round, or luff a-lee, is the excess of this movement, by which it is intended to throw the ship's head up in the wind in order to tack her. A ship is also said to *spring her luff* when she yields to the effort of the helm by sailing nearer to the line of the wind than she had done before. **Luff Tackle**, a name given by sailors to any large tackle that is not destined for any particular place, but may be variously employed as occasion requires. It is generally somewhat larger than the jigger tackle, although smaller than those which serve to hoist the heavier materials into and out of the vessel; which latter are the main and fore-tackles, the stay and quarter-tackles, and so forth.

Lug-Sail, a square sail, hoisted occasionally on the mast of a boat or small vessel, upon a yard which hangs nearly at right angles with the mast. These sails are more particularly used in the barca-longas navigated by the Spaniards in the Mediterranean.

Lumber. One of the distinguishing characteristics of the United States is the quantity of wood and lumber they furnish. Of the well-wooded countries of the world, Russia, Sweden, Norway, and America, this country, no doubt, ranks as first. A discriminating writer, Volney, once described this country as "one vast forest, diversified occasionally by cultivated intervals." If this is less true than it was a century or even half a century ago, it applies in the main at the present moment. Even the oldest States of the Union, such as New Hampshire, New York, and the Carolinas, are still famous for both the quality and quantity of their lumber. And Maine, that had something like settlements before any other portion of New England, is to this day the great lumber State of the land. Hence, perhaps, the name it sometimes gets—the Pine-tree State. The trees of any country are valuable for at least four distinct purposes, for fuel, for shelter, for the food many of them afford, and for ornament. In the last point of view, which is generally considered the least important, trees are of much consequence. England has obtained the name of an extensive garden, very much through its beautiful shade trees and shrubbery. One half of the beauty of many of our New England villages would be lost in the warm season without their elegant natural screens in the shape of trees. It was Lord Bacon who said that "a tree in full leaf is a nobler object than a king in his coronation robes." No artist would ever think of presenting a fine landscape without trees. And so important are trees regarded as objects of beauty and shade, that ornamental tree associations are springing up in different parts of the country, whose objects are to adorn streets and highways with our beautiful elms, maples, and evergreens.

It is stated by Michaux that in the United States there are 140 species of forest trees which attain a greater height than 30 feet, while in France there are only 18 of the same description. And we suppose that the comparison would be similar if extended to Great Britain, Spain, or Germany. No wonder, then, that our forest scenery so much surpasses that in the west and south of Europe, and that European travelers think that it is worth while to cross the Atlantic to see our forest scenery as painted by the invisible artist every autumn.

So great is the interest in portions of Europe to promote the growth of forest trees that associations have been formed in Germany and other countries to plant forests upon soil adapted to their growth. The vast amount of forest trees annually used by such a country as Great Britain may be estimated by the fact that to build a 70 gun ship 40 acres of ship timber are re-

quired. In the light of such a fact, it may be seen that it is none too early for the people of this country to exercise due economy with regard to the use of for-

ests already existing, and to promote the growth of others—on the waste lands that already abound in various sections of the country.

STATEMENT SHOWING THE EXPORTS OF LUMBER (SPECIFYING THE EXPORTING DISTRICTS) FROM THE UNITED STATES, FOR THE YEAR ENDING JUNE 30TH, 1856.

This table shows the singular fact, that Chicago, the greatest lumber market in the world, exports directly no lumber to foreign countries.

The State of Maine, as the head-quarters of the lumber and ship building trade, has for a long time excited much interest. The season for cutting the timber and bringing it to market commences in December or earlier, and closes in March or April.

According to a careful estimate of George W. Cram, Esq., surveyor-general of lumber for Boston, the amount sold at that port in 1854, was 131,900,000 feet. The descriptions were 40,000,000 of white pine lumber, 18,000,000 southern pine, 25,000,000 spruce, 10,000,000 hard wood, 1,800,000 mahogany, 2,100,000 clapboards, 10,000,000 shingles, 20,000,000 laths, 4,000,000 hemlock, 1,000,000 pickets.

The following is a careful estimate of the lumber business. The number of men employed in getting the lumber to market is 120,000; number of cattle

and horses, 80,000; number of saw-mills, 3000; number of vessels, 1000. Pine, spruce, and hemlock lumber is principally obtained from Bangor, Ellsworth, the Kennebec River, Calais, Machias, Cherryfield, Maine, and St. John, New Brunswick, while the larger portion of the hard pine grows in North and South Carolina, Georgia, Florida, and Alabama. Pine and spruce, too, are brought from Canada to Portland, and is thence shipped to this and other markets. The lumber secured from St. John is of a superior quality. Lumber is obtained also from the States of New York, Ohio, and Michigan. The two last States furnish black walnut, cherry, ash, white wood, and basswood; while New York and Pennsylvania furnish a share of the same. The railroads bring to market, oak timber from Massachusetts and New Hampshire. The southern and western States grow a portion of the same, and furnish considerable live oak. New York yields a large quantity of pine. Delaware and Maryland

more sparingly. It is stated that the best hard pine for ship-building grows on the Altamaha River in Georgia, and on the Waccamaw River in South Carolina. It is but a few years since hard pine has been used in ship-building. It is now employed extensively in New England, and is considered as good for many parts of a ship as oak. During the year 1854 a commission house of this city sold about 23,000,000 of feet, to be used mostly in Massachusetts and Maine. It will be perceived that this house sold 5,000,000 feet more than all that was surveyed in the city for that year, showing how large a part of the lumber sold here is not surveyed under our surveyor-general. Formerly there was no hard pine obtained at the South except what grew immediately upon the rivers. But within five or six years the timber upon the margin of the streams has become scarce, so that now it is conveyed for several miles to the rivers, and in some cases is floated 800 miles to some sea-port, from whence it is shipped to the North or to foreign ports.

The reciprocity treaty that has recently been effected between the United States and the British possessions in North America is quite sure to increase our lumber trade, as Canada and the other provinces abound in this great staple. A few statistics will give some idea of the wealth and activity of the British provinces in this department. In 1832 the new ships built in the British colonies were of 32,778 tons burden; while in 1841 the tonnage of the ships built amounted to 108,038 tons, and in 1850 to 112,787 tons. Most of these ships were built for the British market. In the city of Quebec, according to Andrews's Report on Colonial and Lake Trade, there are about 25 ship-building establishments, and 8 or 10 floating docks. The vessels built there average from 500 to 1500 tons. In 1849, 114 vessels were built in New Brunswick, of 36,534 tons burden. Most of the ships built in New Brunswick are constructed in St. John and St. Andrews.

DOMESTIC EXPORTS OF LUMBER AND NAVAL STORES FROM THE UNITED STATES.

	1853.	1854.	1855.
Staves, shingles, boards, etc.	\$2,578,149	\$5,122,834	\$4,609,665
Other lumber.....	123,743	165,178	677,659
Masts and spars.....	129,628	180,522	306,643
Oak bark and dye.....	118,894	95,863	99,168
All manufactures of.....	2,294,122	2,587,270	3,683,420
Naval stores, tar, pitch, rosin, etc.....	1,406,438	2,066,806	2,049,456
Ashes, pot and pearl.....	884,321	322,728	448,499
Total.....	\$6,935,845	\$10,740,701	\$11,874,510

Of these exportations, more than half of the naval stores go to England, and more than half of the lumber to Cuba.

The ship-building interest alone of Massachusetts consumes a vast amount of lumber. In 1837 the vessels built in the State were estimated to be worth \$1,370,649, and the agricultural and domestic articles consuming lumber were worth \$2,952,317. The persons employed in this handiwork were 3950. The estimated value of ships built in this State in 1854 was \$5,000,000. If the value of agricultural and other articles requiring timber advanced in the same ratio the value was fully \$10,000,000 for that year.

There were built in the United States in 1854, 1774 vessels of all descriptions, with a tonnage of 535,636. About a sixth of the value of the whole we find to have been built in Massachusetts. The value of the whole, then, in round numbers, may be stated at \$30,000,000. It is true that the demand for vessels was unusual, and the prices obtained the same. What destruction of forests was made by the ship-building of that single year!

The lumber trade of this country is immense. It costs \$30,000,000 a year to build our ships, and we may form some idea of the cost of all the buildings erected in the country for a year, and then of the cost of all other articles made of wood, and of the cost of the lumber material required.

STATEMENT SHOWING THE EXPORTS OF LUMBER (AND TO WHAT COUNTRIES EXPORTED) FROM THE UNITED STATES FOR THE YEAR ENDING JUNE 30TH, 1856.

Lute, a substance used for making vessels or apparatus air-tight, by closing the apertures of their joints, or for coating, so as to enable them to bear a higher temperature, or for repairing a fracture. Clay is the basis of many lutes; whence the term, from *lutum*, clay. Among the principal lutes are *Stonewbridge clay*, in fine powder, made into a paste with water; *Windsor loam*, a natural mixture of clay and sand; *Willis's lute*, a thin paste made of a solution of borax, in boiling water, with slacked lime. Mixtures of borax and clay also form useful lutes. What is called *fat lute* is a mixture of pipe-clay with drying linseed-oil. Caustic lime furnishes, by admixture with other bodies, a variety of lutes. A mixture of lime and white of egg, or glue, forms a powerful cement. *Iron cement* is useful for making joints tight, as is also white lead ground up with oil and spread on strips of cloth. Among the other substances used as lutes, may be mentioned moistened bladder, paste, and paper; paper prepared with a mixture of wax and turpentine, linseed-meal, and caoutchouc. The last named substance is in exten-

sive use for making chemical joints or elastic connectors, getting rid of that rigidity which, in a complicated arrangement of apparatus is so liable to lead to accident.

Lute, a stringed instrument of music, long since superseded by the harp and the guitar, but for centuries very fashionable in Europe. The music for the lute was written in tablature.

Luxury. The instances of extravagance and luxury are numerous in the history of almost all countries, ancient and modern, and many laws have been enforced to repress them. Horace mentions fowls dressed in Falernian wine, muscles and oysters from the Lucrine lake and Circean promontory, and black game from the Umbrian forests.—*Lardner*. Lucullus, at Rome, was distinguished for the immoderate expenses of his meals. His halls were named from the different gods; and when Cicero and Pompey attempted to surprise him, they were amazed by the costliness of a supper which had been prepared upon the word of Lucullus, who merely ordered his attendants to serve in the hall of Apollo. This feast for three persons casually met would have sufficed for 300 nobles specially invited. In England, luxury was restricted by law, wherein the prelates and nobility were confined to two courses every meal, and two kinds of food in every course, except on great festivals. The law also prohibited all who did not enjoy a free estate of £100 per annum from wearing furs (see **FURS**), skins, or silks: and the use of foreign cloth was confined to the royal family alone: to all others it was prohibited A. D. 1387. An edict was issued by Charles VI. of France, which said: "Let no man presume to treat with more than a soup and two dishes." 1340.—*Haydn*.

Lying-to. A nautical term denoting the state of the ship when the sails are so disposed as to counteract each other, and thereby retard or destroy the progressive motion of the vessel. The fore and main stay-sails and mizzen try-sail serve very well for this purpose, as they cause but little way, and have sufficient power to keep the ship heeled over, and therefore steady, with her decks turned from the sea. When the sea runs very high, the lower sails are liable to be becalmed by the waves, and therefore to suffer the ship to roll to windward; the maintop-sail is then used.

Lyons (Fr. *Lyons*, ancient *Lugdunum*), the capital of the French Department of Rhône, and till recently ranking, in point of population and commercial importance, as the second city of the empire; but the last census returns show that in the former of these respects it has been exceeded by Marseilles. It is situated at the junction of the Saône with the Rhône, and on the Paris and Marseilles Railway, 316 miles from the former, and 218 from the latter city; lat. 45° 45' 45" N., long. 4° 49' 35" E.; elevation above the level of the sea, 963 feet. The Rivers Rhône and Saône being both navigable, it enjoys great facilities for trade; but it is as a manufacturing city that it is chiefly celebrated; and in this respect it is justly entitled to the name of the French Manchester. The staple articles of manufacture are silk stuffs of all descriptions, and which for richness and beauty are unequalled. In this manufacture about 100,000 of the population are either actively or indirectly concerned. There are no exact statistics of the silk manufacture at Lyons; but the following extract from a letter by the President of the Chamber of Commerce at Lyons, dated December 19, 1853, is said to give very nearly the exact results: "During the present year, and the two preceding, the manufacturers of silk at Lyons have employed about 60,000 machines (*metiers*), scattered over a district of about 40 miles. These machines have consumed about 2,500,000 kilogrammes of silk (5,500,000 lbs.), valued at 160,000,000 francs (\$22,000,000); and the manufac-

tured stuffs at 250,000,000 francs (\$50,000,000). It is estimated that the home consumption amounts to one fourth or one third of that quantity. The balance is exported to all parts of the civilized world; but by far the largest foreign market is found in the United States." The silk manufacture in Lyons is not carried on in large factories, but on the domestic system, in the dwellings of the master-weavers, each of which has usually from two to six or eight looms, which, with their fittings, are generally his own property. Himself and as many of his family as can work are employed on these looms, and frequently also one or more *compagnons*, or journeymen. The number of master-weavers in the city and suburbs is estimated to be about 9000. The silk merchants, of whom there are about 600 in Lyons, supply the silk and patterns to the owners of looms, who are intrusted with the task of producing the web in a finished state. The weaving population, though earning comparatively good wages, are an ignorant and degraded race, living in a disgracefully filthy state, and showing little desire to improve their condition. Few of the journeymen ever raise themselves to be master-weavers. The silk manufacture was established here by Italian refugees in the middle of the 15th century. It was nearly ruined by the revocation of the edict of Nantes, which dispersed most of its best workmen to Spitalfields, Amsterdam, Crefeld, and other places. Lyons has numerous dye-works, printing establishments, founderies, glass-works, potteries tan-yards, breweries, chemical works, boat-building yards, etc.; but these are all insignificant compared with its chief branch of industry. The commerce carried on by means of the rivers is very considerable. The town is built principally on the tongue of land, or peninsula, between the Rhône and Saône, each of which is crossed by eight or nine bridges communicating with extensive suburbs lying to the east and west. The old portion of Lyons consists chiefly of narrow, crooked, and dirty streets, rendered dark and gloomy by the great height of the houses on each side, which are generally seven or eight stories high. About three fourths of a century ago, the point of confluence of the two rivers was removed about a mile further south, and on the additional territory thus acquired the suburb of Perrache was formed. This has been laid out on a regular plan, and now contains many elegant streets and some very agreeable promenades. The suburb of La Croix Rousse, to the north of the town, and that of Fourvières, on the right bank of the Saône, are chiefly inhabited by silk-weavers. Those of Brotteaux and Guillotière are on the left bank of the Rhône. The best view of the town and neighborhood is obtained from the summit of the steep hill of Fourvières, on the right bank of the Saône. The fortifications of Lyons consist of 18 detached forts, arranged in a circle of 12½ miles around the town, crowning the heights of St. Croix and Fourvières, and of Croix Rousse, above the suburb of that name, and including in its circuit the suburbs of Brotteaux and Guillotière. These fortifications are required more to quell insurrections among the inhabitants than to withstand attacks from without. In 1831, 1834, and 1837, formidable riots took place, in which many lives were lost. Both banks of the Saône and the left bank of the Rhône are lined with quays, some of which are planted with trees, and afford very agreeable promenades.

In the revolution of 1793, the people of Lyons having declared against the revolutionary party, the city was taken by the conventional army after a siege of upward of two months, and almost reduced to ruins. It suffered severely from the inundations of its two rivers in June, 1866. Population in 1851, 156,169.—E. B.

M.

Macadam, John Loudon, the introducer of macadamized road-making, was descended from an old and respectable family in Kirkcudbrightshire, and was born in Ayrshire, Scotland, in 1756. His plan of road improvement occurred to him when acting as trustee for a district of roads in Ayrshire, and was first carried into practice on the Bristol roads, of which he had been appointed surveyor-general in 1815. He explained his system fully in two works—*A Practical Essay on the Scientific Repair and Preservation of Public Roads*, London, 1819; and *Remarks on the Present State of Road-making*, London, 1820. In 1827 he was appointed general surveyor of roads; and for the large sums which he expended while performing the duties of this office, he was afterward compensated by two grants from government, amounting together to £10,000. The honor of knighthood, which he declined, was conferred upon his son in 1834. Macadam died in 1836.

Macao, a sea-port and settlement belonging to the Portuguese, on the island of the same name, at the mouth of the Canton River, in China, in lat. $22^{\circ} 12' 45''$ N., long. $113^{\circ} 35'$ E. The situation of Macao strikingly resembles that of Cadiz. It is built near the extremity of a peninsula projecting from the south-west corner of the island of Macao, to which it is joined by a long narrow neck. Across this isthmus, which is not more than 100 yards wide, a wall is erected, with a gate and guard-house in the middle for the Chinese soldiers. The greatest length of the peninsula belonging to the Portuguese, from north-east to south-west, is under three miles, and its breadth under half a mile. The broadest part, to the north of the town, is flat, and of a light, sandy soil; but is well cultivated, principally by Chinese, and produces all sorts of Asiatic and European culinary vegetables. Provisions are obtained from the Chinese part of the island or from the main land; and whenever the Portuguese do any thing to offend the Chinese authorities, the provisions are cut off till they are obliged quietly to submit. They are seldom allowed to pass beyond the narrow precincts of the territory assigned to them. The population of the peninsula may amount to from 12,000 to 13,000, of whom considerably more than half are Chinese. The functionaries belonging to the East India Company's factory at Canton resided here during the whole of the dead season. The Portuguese obtained possession of Macao in 1586. It was for a considerable period the seat of a great trade carried on not only with China, but with Japan, Siam, Cochin-China, the Philippine Islands, etc.; but for these many years past it has been of comparatively little importance, though it is probable that, if it belonged to a more enterprising and active people, it might still recover most part of its former prosperity. The public administration is vested in a senate composed of the bishop, the judge, and a few of the principal inhabitants; but all real authority is in the hands of the Chinese mandarin resident in the town.

The harbor is on the west side of the town, between it and Priest's Island; but the water in it not being sufficiently deep to admit large ships, they generally anchor in the roads on the other side of the peninsula, from five to ten miles east south-east from the town. All vessels coming into the roads send their boats to the Portuguese custom-house on the south side of the town. When a ship arrives among the islands, she is generally boarded by a pilot, who carries her into Macao roads. As soon as she is anchored, the pilot proceeds to Macao to inform the mandarin of the nation she belongs to. If there be any women on

board, application must be made to the bishop and senate for leave to send them on shore, as they will not be permitted to proceed to Whampoa in the ship. As soon as the mandarin has made the necessary inquiries, he orders off a river pilot, who brings with him a *chop* or license to pass the Bocca Tigris, or mouth of the Canton River, and carries the ship to Whampoa.

The Chinese regulations do not permit any vessels, except such as belong to Portuguese or Spaniards, of which there are very few, to trade at Macao. But the Portuguese inhabitants lend their names, for a trifling consideration, to such foreigners as wish to be associated with them for the purpose of trading from the port. Independently, however, of this, vessels of other nations usually experience no difficulty in obtaining the connivance of the Chinese officers to the landing or receiving of goods in the roads by means of Portuguese boats. At intervals the prohibitory regulation is strictly enforced. Vessels of other nations, if in distress, and not engaged in the contraband trade, are admitted into the harbor for repairs, on application to the senate.

The following summary exhibits the direct trade between the United States and Macao during the years 1854 and 1855—the latter year up to March 6th: Arrived, 3 barks and 1 ship, measuring 1828 tons, laden with rice, sundries, salt provisions, and miscellaneous goods. The return cargoes were chiefly Coolies.

Port Charges.—The measurement duty paid by Spanish and Portuguese vessels is moderate. When a vessel has once paid the full amount, and is admitted on the list of registered ships belonging to the port (limited by the Chinese to 25), she is liable only to a third of the original charges, on every subsequent occasion of her entering, so long as she continues on the register. Portuguese vessels from Europe do not possess this privilege, unless they be registered as belonging to a morador of Macao. The rates of measurement duty, which vary, as at Canton (which see), on three classes of vessels, are the following: On vessels of 164 covids and upward, 6.223 taels per covid; on vessels from 120 to 154 covids, 5.72 taels per covid; on vessels from 90 to 120 covids, 4 taels per covid.

These rates are nearly the same as those levied on Canton junks trading with foreign countries, and ought, in fact, to be entirely so. The dimensions are taken and calculated in the manner formerly practiced at Canton; but the Chinese, at both places, speak not of the covid, but of the chang of 10 covids. However, as this is only a decimal increase, it makes no difference in the method of calculation. The following additional charges, to be calculated on the amount of measurement duty, are the same on every class of vessels, viz.: 2 per cent. for inspectors; 8 per cent. for difference in weight by the treasury scales; 10 per cent. for loss in melting; 17 per cent. for making sycee. Also the sum of 70 taels for the "public purse," or hoppo's treasury.

In addition to these, the following are the charges levied by the hoppo (collector of customs), or his deputy: On a 1st class vessel from Europe, 250 taels; if belonging to Macao or Manilla, 50 taels. On a 2d class vessel from Europe, 240 taels; if belonging to Macao or Manilla, 40 taels. On a 3d class vessel from Europe, 170 taels; if belonging to Macao or Manilla, 30 taels. Ships importing rice are exempt from the measurement duty, and pay only \$50, as fees to the procurador of Macao and the officers of his department. Portuguese vessels from Europe, in addition to the measurement duty, have to pay to the Canton

hong merchants a charge, termed by the Portuguese, Hanistagem, or Consoo charge, which is usually a matter of specific bargain, varying from about \$200 on a vessel of 200 tons to \$3500 and upward on those of 500 tons, and of larger sizes. The charges on goods carried by the inner passage, between Canton and Macao, being generally less than those paid on goods to and from Whampoa; and the duties levied by the Portuguese, on articles of merchandise imported by vessels belonging to Macao, being very moderate; the Chinese are often led to engage in speculations on board the Macao vessels, the risk being so much less than in native junks. If the ship owners could manage their expenses so as to be satisfied with only the same freight as is charged by English vessels, it would probably induce many more Chinese to make remittances in this way.

Opium.—The trade in opium is prohibited at Macao by the Chinese government, as well as throughout the rest of the empire. It was, nevertheless, formerly carried on to a great extent by the Portuguese moradores, or citizens, to the exclusion of all others, even Portuguese who were not citizens. But this restriction, having occasioned the decline of the trade, it was abolished in 1823, when the senate passed a regulation throwing open the trade to all, without distinction, whether Portuguese or foreigners; securing to the latter "hospitality and the utmost freedom in the speculations." At present, however, very little opium is imported, in consequence, it is said, of the heavy bribes demanded by the Chinese officers, to insure their connivance. The trade is now principally carried on at Lintin, about 30 miles from Macao.

Imports.—Goods imported pay at the Portuguese custom-house a duty of 6 per cent. on a fixed valuation, besides some fees, and Coolie hire. The following are a few articles extracted from the tariff:

Articles.		Valuation.	Duty.
		Taels.	Taels.
Cotton.....	per picul	4	0.240
Broad cloth, middling.....	per covid	1.600	0.096
" better than ordinary	"	0.800	0.048
" ordinary or coarse	"	0.450	0.025
Camlets.....	"	1.250	0.016
Betel nut.....	per picul	1.200	0.072
Tin.....	"	8	0.450
Birds' nests, 1st sort.....	per catty	22.400	1.344
Rattans.....	per picul	1.200	0.072
Saltpetre, Bengal.....	"	4	2.240
" coast of Goa.....	"	1.600	0.096
Pepper.....	"	4	0.240
Opium imported in Portuguese ships.....	per chest	104	drs.
" foreign ships.....	"	154	"

Gold and silver, whether in coin, in bullion, or manufactured, pay, on importation, 2 per cent.; except in Spanish vessels from Manila, when the charge is 1½ per cent.

Exports.—No duty is levied by the Portuguese on goods exported from Macao; nor does the custom-house take any cognizance of them.

Duties and Charges on Goods landed at Macao.—Macao is a place without any manufactures or commerce of its own. Prices are, in consequence, generally dependent on those of Canton. Money is usually paid at 72 taels per \$100. It is a point of some interest to ascertain the internal duties and expenses to which goods landed at Macao are liable before coming into the Chinese purchaser's hands at Canton. But the subject is so involved in mystery and uncertainty, the charges varying according to the quantity of goods laden in one boat, etc., that it is scarcely possible to arrive at any accurate information respecting it. We believe, however, that the following may be considered as a pretty close approximation to the real amount of charges incurred on cotton landed at Macao:

Portuguese duty, fees, etc., 2-6 mace per picul; duties and charges on conveyance to Canton, 6-8 mace per picul; Canton charges, difference of weight,

brokerage on sale, etc., 8 mace per picul; total, about 2 taels 6-9 mace. The duties and charges on conveyance from Macao to Canton are, for pepper, 9 mace per picul; rattans, 4-5 mace per picul; betel nut, 4-5 mace per picul.

The hoppo's examiner charges 90 taels per boat of 1000 piculs, the largest quantity allowed to be conveyed by a single boat; but the same charge of 90 taels is levied, although the boat should only contain 100 piculs. The duty on exporting goods from Canton to Macao is in some cases less, in other cases greater, than the Whampoa duty. Thus, nankeens to Macao pay \$2 per 100 less than to Whampoa. Most descriptions of silk piece goods also pay less duty. On the other hand, tea, paper, China ware, etc., pay a higher duty to Macao than to Whampoa.

For details as to the *Weights, Measures, etc.*, used at Macao, see CANTON.

For further particulars, see HAMILTON's *East India Gazetteer*, art. MACAO; MILBURN's *Orient. Com.*; and the *Anglo-Chinese Kalendar Companion to the Almanac*, Macao, 1832.

Macaroni, a species of wheaten paste formed into long, slender, hollow tubes, used among us dressed with cheese, and in soups, broths, etc. Macaroni is the same substance as vermicelli; the only difference between them being that the latter is made into smaller tubes. Both of them are prepared in the greatest perfection in Naples, where they form the favorite dish of all classes, and the principal food of the bulk of the population. The flour of the hard wheat (*grano duro*) imported from the Black Sea is the best suited for the manufacture of macaroni. Being mixed with water, it is kneaded by means of heavy wooden blocks wrought by levers, till it acquires a sufficient degree of tenacity; it is then forced, by simple pressure, through a number of holes, so contrived that it is formed into hollow cylinders. The name given to the tubes depends on their diameter; those of the largest size being macaroni, the next to them vermicelli, and the smallest fedelini. At Genoa, and some other places, the paste is colored by an admixture of saffron; but at Naples, where its preparation is best understood, nothing is used except flour and water; the best being made of the flour of hard wheat, and the inferior sorts of the flour of soft wheat. When properly prepared and boiled to a nicety, Neapolitan macaroni assumes a greenish tinge. It is then taken out of the caldron, drained of the water, and being saturated with concentrated meat gravy, and sprinkled with finely-grated cheese, it forms a dish of which all classes, from the prince to the beggar, are passionately fond. But the macaroni used by the poor is merely boiled in plain water, and is rarely eaten with any condiment whatever. The macaroni usually served up in England is said, by those familiar with that of Naples, to be a disgrace to the name it bears. When properly prepared, macaroni is nutritious and easy of digestion. The lazzaroni pique themselves on the dexterity with which they swallow long strings of macaroni and vermicelli without breaking them.

Mace (Ger. *Macis*, *Muskatenbluthe*; Du. *Foelie*, *Foely*, *Muscaatbloom*; Fr. *Macis*, *Fleur de muscade*; It. *Mace*; Sp. *Macio*; Port. *Maxcis*, *Flor de noz moscada*; Lat. *Macis*), a thin, flat, membranous substance, enveloping the nutmeg; of a lively, reddish yellow color, a pleasant aromatic smell, and a warm, bitterish, pungent taste. Mace should be chosen fresh, tough, oleaginous, of an extremely fragrant smell, and a bright color—the brighter the better. The smaller pieces are esteemed the best. The preferable mode of packing is in bales, pressed down close and firm, which preserves its fragrance and consistence. It is imported from the Moluccas, where the best is to be found. The import trade in mace for home consumption in Great Britain for three years ending with

31st December, 1856, was: in 1854, 25,584 lbs.; in 1855, 28,563 lbs.; in 1856, 27,299 lbs. The present (1857) duty on mace imported into Great Britain is 1s. per lb. A production is met with on the coast of Malabar, so like mace, that at first it is not easy to be distinguished; but it has not the least flavor of spiciness, and when chewed has a kind of resinous taste.

Machinery. The effects produced upon the world by the interposition and general use of machinery, are very important. Serious obstacles were at first presented and objections made by the masses, upon the ground that the use of machinery was opposed to the interests of labor. Gradually these objections wore away, it being found that there was, and still is, employment for all classes, even with the extraordinary facilities added by the many improvements in machinery. These questions have been fully discussed by some of the ablest writers in England and the United States. As to the "effects of machinery and accumulations," see *Edin. Rev.*, xxxv., p. 102, lvi., 313; *Quar. Rev.*, xxxi., 391; *Fraser*, viii., 167, ii., 419; *Am. Monthly*, iii., 24; *Westm. Rev.*, v., 101, xiv., 191; *North Am. Rev.*, xxxiv., 220, xiv., 401; *Am. Quar.*, xii., 300.

Macintosh Cloth. The manufacture of the Macintosh cloth is a singular one. The material is merely two layers of cotton cemented with liquid India-rubber; but the junction is so well effected, that the three become, to all intents and purposes, one. The stout and well-woven cotton cloth is coiled upon a horizontal beam, like the yarn beam of a loom; and from this it is stretched out in a tight state and a nearly horizontal position. A layer of liquid, or rather paste-like, solution is applied with a spatula, to a considerable thickness, and the cloth is drawn under a knife edge, which scrapes the solution and diffuses it equally over every part of the cloth, which may be 30 or 40 yards long. The cloth is then extended out on a horizontal framework to dry; and, when dried, a second coating is applied in a similar way; and a third and fourth may be similarly applied if necessary. Two pieces, thus coated, are next placed face to face with great care, to prevent creasing or distortion; and, being passed between two smooth wooden rollers, they are so thoroughly pressed as to be made to unite durably and permanently. Cloth, thus cemented and doubled and dried, may be cut and made into garments which will bear many a rough trial and many a deluging before rain or water can penetrate.

Madder (Ger. *Färberöthe*; Du. *Mee*; Fr. *Alizari*, *Garance*; It. *Robbia*; Sp. *Granza*, *Rubia*; Rus. *Mari-ona*, *Krap*; Hind. *Munjih*), the roots of a plant (*Rubia tinctorum*), of which there are several varieties. They are long and slender, varying from the thickness of a goose-quill to that of the little finger. They are semi-transparent, of a reddish color, have a strong smell, and a smooth bark. Madder is very extensively used in dyeing red; and though the color which it imparts be less bright and beautiful than that of cochineal, it has the advantage of being cheaper and more durable. It is a native of the south of Europe, Asia Minor, and India; but has been long since introduced into and successfully cultivated in Holland, Alsace, Provence, etc. Its cultivation has been attempted in England, but without any beneficial result. Our supplies of madder were, for a lengthened period,

almost entirely derived from Holland (Zealand); but large quantities are now imported from France and Turkey. Dutch or Zealand madder is never exported except in a prepared or manufactured state. It is divided by commercial men into four qualities, distinguished by the terms *mull*, *gamen*, *ombro*, and *crops*. The roots being dried in stoves, the first species, or mull, consists of a powder formed by pounding the very small roots, and the husk or bark of the larger ones. It is comparatively low priced, and is employed for dyeing cheap dark colors. A second pounding separates about a third part of the larger roots; and this, being sifted and packed separately, is sold here under the name of *gamene*, or *gemeene*. The third and last pounding comprehends the interior, pure, and bright part of the roots, and is sold in Holland under the name of *kor krops*, but is here simply denominated *crops*. Sometimes, however, after the mull has been separated, the entire residue is ground, sifted, and packed together, under the name of *onberoefde*, or *ombro*. It consists of about one third of *gamene*, and two thirds of *crops*. Prepared madder should be kept dry. It attracts the moisture of the atmosphere, and is injured by it. The Smyrna or Levant madder (*Rubia peregrina*), the *alizari* or *lizary* of the modern Greeks, is cultivated in Boeotia, along the border of Lake Copais, and in the plain of Thebes. It also grows in large quantities at Kurdar near Smyrna, and in Cyprus. The madder of Provence has been raised from seeds carried from the latter in 1761. Turkey madder affords, when properly prepared, a brighter color than that of Zealand. It is, however, imported in its natural state, or as roots; the natives, by whom it is chiefly produced, not having industry or skill sufficient to prepare it like the Zealanders, by pounding and separating the skins and inferior roots; so that, the finer coloring matter of the larger roots being degraded by the presence of that derived from the former, a peculiar process is required to evolve that beautiful Turkey red which is so highly and deservedly esteemed.—*THOMSON'S Chemistry*; *BANCROFT on Colors*, vol. ii., pp. 221-278; see also *Beckmann, Hist. of Invent.*, vol. iii., art. *Madder*.

In France, madder is prepared nearly in the same manner as in Zealand. The following details are in regard to its cultivation, price, etc., in Provence.

This town (Avignon) is the centre of the madder country, the cultivation of which was introduced here about the middle of the 18th century, and, with the exception of Alsace, is still confined (in France) to this Department (Vaucluse). The soil appears to be better adapted for its cultivation here than anywhere else, and it has long been the source of great wealth to the cultivators. Of late years, however, the prices have fluctuated so much, that many proprietors have abandoned, or only occasionally cultivated this root, so that the crop, which was formerly estimated to average 500,000 quintals, is now supposed not to exceed from 300,000 to 400,000. The root is called *alizari*, and the powder (made from it) *garance*. The plant is raised from seed, and requires three years to come to maturity. It is, however, often pulled in 18 months without injury to quality; the quantity only is smaller. A rich soil is necessary for its successful cultivation; and when the soil is impregnated with alkaline matter, the root acquires a red color; in other cases it is yellow. The latter is preferred in England, from the long habit of using Dutch madder, which is of this color; but in France the red sells at 2 francs per quintal higher, being used for the Turkey red dye. It is calculated that when wheat sells at 20 francs per hectolitre, *alizari* should bring 85 francs per quintal (poids de table), to give the same remuneration to the cultivator. That is, wheat 63s. per English quarter, and *alizari* 34s. per English cwt. The price has, however, been frequently as low as 22 francs per quintal. Prices undergo a revolution every 7 or 8 years, touch-

ing the minimum of 22, and rising as high as 100 francs. As in every similar case, the high price induces extensive cultivation, and this generally produces its full effect 4 or 5 years after. The produce of Alsace, which is inferior both in quantity and quality to that of Vaucluse, is generally sold in Strasburg market. England employs both the root and the powder, according to the purpose for which they are intended. The Dutch madder is more employed by the woolen dyers, and the French by the cotton dyers and printers. In making purchases of *garance*, it is essential to employ a house of confidence, because the quality depends entirely upon the care and honesty of the agent. The *finest* is produced from the roots after being cleaned and stripped of their bark. The *second* by grinding the roots without cleaning. A *third* by mixing the bark of the *first* while grinding; and so on to any degree of adulteration.

Madagascar, a large and important island in the Indian Ocean, about 300 miles from the coast of Africa, from which it is separated by the Mozambique Channel. Cape Amber, its northern extremity, is situate in S. lat. 12°, whence it extends southward, slightly inclining to the west, about 937 English miles, to Cape St. Mary, in S. lat. 25° 40'. Its extreme western shore is in E. long. 43° 10', and its most easterly cape in E. long. 50° 30'. The breadth of the island increases gradually from the northern point to the centre, where it is widest, being about 350 miles across; while the average breadth of the southern portion is about 250 miles. It has been estimated to contain 150,000,000 or even 200,000,000 acres of land; and though such estimates, in the absence of actual measurements, can only be regarded as approximations to its actual extent, its surface is equal to three fourths of the territory of France, and larger than Great Britain and Ireland combined.

The coasts of Madagascar contain a number of bays and harbors, some of them spacious and sheltered, and capable of affording excellent and secure anchorage for shipping of the largest dimensions. Among these may be specified Diego Saurez Bay, or British Sound, near the north-eastern extremity of the island; Port Loquez, Antongil Bay, and the Bay of St. Luce, on the eastern coast. Samatave and Foule Point, though the most frequented ports on this side of the island, are only open roadsteads, protected by reefs of coral. St. Augustine's Bay, a port of frequent resort for vessels trading on the north-west coast and ships engaged in the whale fishery, Tolia Bay, Boiana, Bambetoka, Majambo, Nareenda, Pasandava, and Chimpaykee Bays, are the most important on the western coast. There are several small islands adjacent to the northern shores of Madagascar, of which St. Mary's, 31 miles long, and 2 or 3 miles broad, on the eastern coast, and Nosibé, a somewhat larger and more compact island, on the north-west coast are the most important. Both these small islands are now occupied by the French—the latter having been taken possession of by them in 1840.

The commerce of the island, though at present but trifling, is capable of almost unlimited extension. The chief articles of export are cattle, poultry, rice, rufia cloth, matting; a kind of grass hat, woven by hand, light and durable; gums, and bees' wax. Coffee

would grow well in many parts of the island; indigo might be produced to almost any extent; and both might furnish valuable articles of export. Good sugar has been made, but at present the cane is only cultivated for purposes of food, or for distilling from its juice a strong, fiery sort of arrack, the use of which is extended among the people, especially at the ports, and threatens to produce the most disastrous consequences. Other articles of export might be produced in a country so fertile and extensive; and rice might, with but comparatively little additional labor, be raised in much larger quantities than it is produced at present. It is scarcely possible to conceive of a soil more adapted for the cultivation of rice than that of many parts of Madagascar, or more fertile than, in favorable seasons, it often proves—a single bushel of seed yielding, under the most skillful modes of culture, in a favorable season, 100 bushels of grain. The crop, when ripe, is reaped, dried, and thrashed on the ground. Their process of thrashing consists in taking up large handfuls of rice and straw, and beating the ears on a stone or portion of rock fixed in the midst of a dry, hard, thrashing-floor, prepared for that purpose in some central spot easily accessible from the cultivated fields. When the grain is thrashed, it is carried on the heads of slaves to the granaries of their owners. These granaries vary in structure in different parts of the island. On the eastern coast and to the southward, the grain is stored in small houses raised on posts, with projecting ledges, to prevent the access of rats and mice. At the capital and some of the central provinces, the rice is preserved in granaries built of clay, in the form of a cone, with only one aperture on the summit. Some of these granaries are built above ground adjacent to the dwellings of their owners; others are constructed of the same form and dimensions under ground—the aperture at the top, generally about a foot below the surface, being covered with a stone, and then the hollow filled up with earth composing the surface of the court-yard, in which the underground granary is usually sunk. Rice, by these means, is often preserved for a great length of time in excellent condition. With land so fertile and adapted for the growth of such abundant crops of rice as the plantations in the interior often yield, it might be raised for exportation to almost any extent; but the absence of canals and public roads, and all means of land carriage, precludes the possibility of conveying the produce of many of the provinces to the sea-ports, excepting in comparatively small quantities, and thus impedes very materially the development of the resources of the island. The government has been deterred from constructing or encouraging the formation of public roads, from an apprehension of the facilities they would afford to a hostile force invading the country and seeking to penetrate the interior. The want of good roads, therefore, though detrimental to their commercial interests, is preferred by them as a means of security. This disadvantage might be, to a great extent, compensated in some of the provinces by greater attention to the means of carriage by water. The late Radama commenced the work of connecting some of the principal lakes on the eastern coast by means of a canal, but since his death the work has been discontinued. Boats, better adapted for conveying grain in larger quantities to the places adjacent to the ports, and accessible by water, might be constructed, and would assist in augmenting the exports from the island. Their imports are chiefly cotton and woolen goods, wearing apparel, articles of domestic use, fire-arms, ammunition, wines and liquors; and to these other articles will doubtless be added as their means of purchasing them increase. The Hovas, the paramount race in the country, exhibit many of the elements of a thoroughly commercial people; keenness in trade seems to be intuitive with many, and the love of bartering almost a passion among all; scarcely any

engagement interferes with the market, and multitudes employ themselves in hawking goods of foreign or domestic manufacture about the country for sale. In this occupation many persons of rank and property employ their slaves, giving them a percentage on the amount or the profit of their sales. The dealings of the Hovás are seldom transactions of barter or exchange, but usually money purchases. The only coins they use are Spanish dollars, and very recently five-franc French pieces. For all the cattle exported, these silver coins alone are received in payment. The Malagasy have no native currency; and for ordinary use among themselves, the Spanish dollar is cut into halves, quarters, eighths, and smaller portions, even to the 1-72d part of a dollar. The cut pieces of the dollar are weighed in every instance, and a pair of money scales with their appropriate iron weights, are not only considered essential in every house, but are often seen thrust into the girdles of the men when employed in their ordinary avocations. Money-changers are a distinct class among the traders, and the rate at which whole dollars and cut silver are exchanged fluctuates almost daily at the capital and other principal places, as the one or the other are most in demand. In other parts of the island, especially those remote from the capital or the ports visited by shipping, the trade among the inhabitants is carried on to a great extent by exchange, or barter. Several attempts have been made by the foreign traders to induce the natives to receive gold coin in payment for cattle and other articles, but hitherto without success. The Hovás are not ignorant of the relative value of gold and silver, but at present seem only to value the former for the manufacture of jewelry and other articles of personal ornament.

Madeira. The Madeira Isles are a group in the Atlantic Ocean, belonging to Portugal, from the south-west coast of which they are distant 660 miles south-west. They consist of the islands of Madeira and Porto Santo, and the islands called the Desertas, situated between $32^{\circ} 23' 15''$ and $33^{\circ} 7' 50''$ N. lat., and $16^{\circ} 18' 30''$ and $16^{\circ} 38' 38''$ W. long. The largest island, Madeira, is 31 miles long and 12 miles broad. Population, 1850, 108,464. Capital, Funchal. It consists of a mass of volcanic rocks, which, in Pico Ruivo, rise to 6056 feet in elevation. From the central mass, steep ridges extend to the coast, where they form precipices of 1000 to 2000 feet in height. The only plains are a small portion of the west coast, and the tableland of Paul de Serra in the interior. The roads are very steep and unfit for carriages. Oxen are the only beasts of draught, and ponies are used in traveling. Climate remarkably equable, and celebrated for its salubrity, on which account numerous visitors, afflicted with disease of the lungs, constantly resort to Madeira. The soil, which on the south side extends $2\frac{1}{2}$ miles inland, is well watered, and extremely productive. Sugar, once extensively cultivated, is now neglected. Coffee is grown of superior quality, and the arrow-root is excellent. The orange, banana, and guava, are abundant. Wheat, maize, beans, and barley, are cultivated to a small extent, but quite insufficient for home consumption. The failure of the potato, formerly the chief support of the population of the villages and remote districts, has added to the existing distress, and the condition of the lower orders is that of squalid poverty. Madeira was settled by the Portuguese in 1431.

It is said that plants of the vine were conveyed from Crete to Madeira in 1421, and have since succeeded extremely well. There is considerable difference in the flavor and other qualities of the wines of Madeira; the best are produced on the south side of the island. The method of cultivation most generally followed is to trench the ground from three to seven and seven to nine feet deep, according to the nature of the soil, and lay a quantity of loose and stony earth at the bottom,

to prevent the roots from reaching the clayey soil beneath, which would otherwise oppose their growth. The ground is watered three times if the summer has been very dry, the sluices being left open until the ground is pretty well saturated; the less the ground is watered, the stronger the wine, but the quantity is diminished in proportion. The vines are found to bear fruit as high as 2700 feet, but no wine can be made from it. Adjacent to Madeira is the island of Porto Santo, about six miles long, and two and a half broad. It is high and rocky, composed principally of sand-stone, and a calcareous tuffa of a greenish gray color. The vine is cultivated in considerable quantities, and the soil yields good crops of wheat, Indian corn, barley, and beans. The population is estimated at 1400, and there are 800 militia. It possesses a good roadstead, but the landing-place is bad. The Desertas are small, uninhabited islands, which, with Madeira and Porto Santo, form the group called the Madeiras.

The manufactures of Madeira are insignificant; their chief object being to satisfy some of the simple wants of the poorer classes. Baskets, straw hats, coarse linen and woollen articles, and shoes, are the principal objects. Artificial feathers, flowers, and sweatmeats are made for sale by the nuns. A good deal of needle-work embroidery has been executed of late years by the women of Funchal for exportation, and a few fancy articles are made of the fibre of the *Agave Americana*. The bulk of the laboring population is employed in agricultural pursuits. Wine has hitherto been the chief article of export, but this branch of trade will soon cease. The rearing of the cochineal insect has been lately undertaken, in the hopes of its supplying the loss of the grape. Many of the coopers employed during the existence of the wine trade have emigrated; the rest earn a precarious subsistence. The casks they made possessed repute for excellence of construction. The chief artisans of Funchal at present are boot and shoemakers, cabinet-makers, carpenters, and stone-masons. The number of merchant ships anchoring at Funchal (which is the only foreign port) during 1855 was 242, of which 121 were British, and 91 Portuguese. The chief imports are, manufactured goods, iron ware, grain, salt, and timber. In 1855, of grain there was imported 195,765 bushels, principally from the neighboring coast of Africa, and from the Azores. In the same year 27,800 bushels of salt entered. The official returns of the imports of manufactured goods can not be relied on. The total receipts of the custom-house in 1855 amounted to rather more than £17,000. There is no bank on the island; the gold and silver coin in circulation is not Portuguese, but British, American, and Spanish. Accounts are made out in *reis*, imaginary coins, 4800 of which are equal by law to the pound sterling. Spanish and American dollars are current, at the value of 1000 *reis*, or 4s. 2d. British money. Funchal is a coaling station for the British mail steamers from England to Brazil and the African coast, which touch here once a month on their outward voyages, and again on their return. The Portuguese and French steamers to Brazil likewise touch here. Besides these vessels, two English sailing-packets are continually plying between London and Madeira, and a Portuguese packet-brig to and from Lisbon.

The cereal crops of Madeira are scarcely equal to one third the consumption; and hence, and owing also to the general poverty of the inhabitants, a decree was passed in 1843 reducing the duties on the leading foreign imports to one half the duties levied in Portugal. This decree is in force at this time, and, consequently, but half the duties fixed in the tariff of Portugal are now levied on foreign imports into Madeira. In 1843 the imports from the United States amounted to \$59,900, and the exports from Madeira to the United States to \$2750, employing 38 vessels, with an aggregate tonnage of 8533 tons. The commerce of this island with foreign nations, and especially with the United States, is declining, and must continue to decline so long as the vines remain diseased, as wine is the only article of export from Madeira.

See *Am. Jour. Science*, xxiv., 237; *North Brit.*, vii., 73; *North Am. Rev.*, xli., 336 (by J. W. WEBSTER). For Madeira Wine, see WINE.

Madeira Nut, or Persian Walnut (*Juglans regia*), originally a native of Persia, or the north of China, has been somewhat extensively distributed, and appears to be well adapted to the climate of the middle and southern latitudes of the United States. A tree of the "Titmouse" or "thin-shelled" variety (*Juglans regia tenera*), about 20 years planted, 45 feet in height, and 15 inches in diameter, standing on the premises of Colonel Peter Force, in the city of Washington, is perfectly hardy, and bears yearly an abundance of excellent nuts. This is considered the most valuable of all the walnuts, as the tree begins to bear in eight or ten years from planting the seed; and the fruit is very delicate, keeps well, and is rich in oil. In Cashmere, where the walnut is the subject of careful cultivation, there are four varieties: The "Kanak," or wild, the nut of which is diminutive, with a thick shell and scanty kernel; the "Wantu," having a large nut, with a thick and hard shell, a deficient kernel; the "Denu," also a large nut, with a thick and rather

hard shell, and a kernel large, good, and easily extracted; and the "Kaghazi," so called from its shell being nearly as thin as paper. The latter, which may be readily broken by the hand, is the largest of all, having a kernel easily extracted, and producing an excellent oil. Its superiority is said to be attributable to its having been originally engrafted, but it is now raised from seeds alone, and does not degenerate. The nuts, after being steeped in water eight days, are planted in the beginning of March, and the shoot generally makes its appearance in about 40 days. If reared by grafts, the process is performed when the plant is five years old. The head being cut off horizontally, at a convenient height, the stock is partially split, or opened, and the scion inserted in a similar manner to that adopted by our cleft method, in grafting the apple or pear; but clay-mortar, worked up with rice-husks, is put round it, and kept from washing away by being enveloped in broad slips of birch-bark.—*Patent Office Report*, 1855.

In Cashmere, the walnut-tree begins to fruit, ordinarily, when seven years old; but two or three years more elapse before it is in full bearing. The average annual number of nuts, brought to maturity on a single tree, often amounts to 25,000. It has been observed that, after a few seasons of full bearing, the trees fall off in producing fruit, and run, with great luxuriance, to leaf and branch. To this latter condition the Cashmereans apply the appellation of "must," and to remedy the evil, cut off all the small branches, bringing the tree to the state of a pollard. The year following, shoots and leaves alone are produced, which are succeeded the next season by an abundant crop of nuts. The cut ends of the branches swell into knots, or knobs, which are somewhat unsightly in the tree, until they are concealed by the growth of the young branches and leaves. When ripe, the fruit of the Wantu walnut is retailed in the city at the rate of about 2 cents a 100. The nuts

of the Danu are sold for about 3 cents per 100; and of the Kaghazi, at about 4 cents per 100. It is a common practice for the country people to crack the walnuts at home, and carry the kernels alone to market, where they are sold to oil-pressers, for extracting their oil. The kernels yield half their weight in oil; and the other half, which consists of oil-cake, is much valued as food for cows in winter, when it is usually exchanged for its weight of rough rice. About 1,150,000 pounds of walnut kernels are annually consigned to the oil-press in Cashmere, producing a large amount of oil and cake, besides a considerable quantity eaten by man, or consumed by other modes. Walnut oil, in that country, is preferred to linseed oil, for all the purposes to which the latter is applied. It is employed in cookery, and also for burning in lamps, without much clogging the wick or yielding much smoke. It is exported to Thibet, and brings a considerable profit. By ancient custom, the crop of nuts was equally divided between the government and the owner of the tree, but at present, the former takes three fourths; yet, even under this oppression, the cultivation of this product is extended, and Cashmere, in proportion to its surface, produces a much larger quantity of nuts than any other portion of the globe. Estimating the product of each tree at a bushel of nuts, and supposing that it will produce that quantity in 12 or 15 years after planting, and considering that the amount imported into this country is valued at least at \$100,000 per annum, the inducements for its culture by the farmers and planters of the middle and southern States would appear to be sufficiently ample for their immediate attention.—*Patent Office Report.*

Madras, the principal emporium of the coast of Coromandel, or western shore of the Bay of Bengal; latitude of light-house $13^{\circ} 5' 10''$ N., long. $80^{\circ} 20'$ E. It is the seat of the government of the second presidency of British India, having under it a territory, including the tributary States, of 187,482 square miles, with a population, according to the census of 1850-51, of 27,054,672, paying a gross annual revenue of nearly £4,900,000 sterling. The town is situated in the Carnatic province, a low, sandy, and rather sterile country. It is without port or harbor, lying close upon the margin of an open roadstead, the shores of which

are constantly beat by a heavy surf. Besides these disadvantages, a rapid current runs along the coast; and it is within the sphere of the hurricanes or typhoons, by which it is occasionally visited. In every respect, indeed, it is a very inconvenient place for trade, and its commerce is consequently greatly inferior to that of either Calcutta or Bombay. It has been in the possession of the English above two centuries, having been founded by them in 1639, and retained ever since. Fort St. George is a strong and handsome fortification, lying close to the shore. The Black Town of Madras, as it is called, stands to the north and eastward of the fort, from which it is separated by a spacious esplanade. Here reside the native, Armenian, and Portuguese merchants, with many Europeans unconnected with the government. Like most other Indian towns, it is irregular and confused, being a mixture of brick and bamboo houses. Madras, like Calcutta and Bombay, is subject to English law; having a Supreme Court of Judicature, the judges of which are named by the crown, and are altogether independent of the local government and the East India Company. The population is not exactly ascertained, but there are said to be about 400,000 persons within a radius of $2\frac{1}{2}$ miles round Fort St. George.

Madras is the seat of all the chief government offices for the President of the Supreme Court, Boards of revenue, admiralty, education, etc.; and though having less foreign trade than the capitals of the other presidencies, its commerce is still considerable, as it is the chief emporium of the Coromandel coast, and trades direct with Great Britain and the other European countries, the United States, Ceylon, and south-east Asia. Principal imports are rice and other grains, chiefly from Bengal; cotton piece goods, twist, and metallic wares from Great Britain; raw silk, areca, betel, gold dust, spices, and teak timber from Pegu; spirits and wines, coral beads, horses, drugs, to the total value, in 1851-52, of £1,958,736. Exports of cotton stuffs and wool, indigo, pepper, timber, coffee, and other native produce, amounted in the same year to £3,075,103. The site of the city formed the first territorial acquisition by the British in India, permission to erect a fort here having been obtained in 1639.

SUMMARY OF THE EXTERNAL COMMERCE OF MADRAS BY SEA, IN 1849-50 AND 1850-51.

In Madras roads, large ships moor in from 7 to 9 fathoms, with the flagstaff off the fort bearing W.N.W., 2 miles from shore. From October to January is generally considered the most unsafe season of the year, in consequence of the prevalence, during that interval, of storms and typhoons. On the 15th of October the flagstaff is struck, and not erected again until the 15th of December; during which period a ship coming into the roads, or, indeed, anywhere within soundings on the coast of Coromandel (reckoned from Point Palmyras to Ceylon), vitiates her insurance, according to the conditions of the policies of all insurance offices in India. The cargo boats used for crossing the surf, called *Massula* boats, are large and light; made of very thin planks sewed together, with straw in the seams instead of caulking, which it is supposed might render them too stiff. When within the influence of the surf, the coxswain stands up, and beats time in great agitation with his voice and feet, while the rowers work their oars backward, until overtaken

by a strong surf curling up, which sweeps the boat along with frightful violence. Every oar is then plied forward with the utmost vigor to prevent the wave from taking the boat back as it recedes; until at length, by a few successive surfs, the boat is thrown high and dry upon the beach. The boats belonging to ships in the roads sometimes proceed to the back of the surf, and wait for the country boats from the beach to come to them. When it is dangerous to have communication with the shore, a flag is displayed at the beach-house, which stands near the landing-place, as a caution. The fishermen and lower classes employed on the water use a species of floating machine of a very simple construction, named a *catamaran*. It is formed of 2 or 3 logs of light wood, 8 or 10 feet in length, lashed together, with a small piece of wood inserted between them to serve as a stem-piece. When ready for the water, they hold generally 2 men, who with their paddles impel themselves through the surf, to carry letters, or refreshments in small quantities,

to ships when no boat can venture out. They wear a pointed cap made of matting, where they secure the letters, which take no damage. The men are often washed off the catamaran, which they regain by swimming, unless interrupted by a shark. Medals are given to such catamaran men as distinguish themselves by saving persons in danger.

The limited extent of the trade of Madras as compared with that of Calcutta and Bombay, is partly ascribable to the badness of its port or roadstead, the want of any navigable river or other easy means of communication with the interior, and the backward state of the provinces of which it is the capital, in consequence of the heavy and fluctuating land tax to which they are subject. In 1839-40, there arrived at Madras no fewer than 5,426 vessels (including their repeated voyages of the aggregate burden of 835,465 tons. But by far the greater number of these were of very small burden; 2,832 being country craft from Bombay, 853 from Ceylon, and 585 from Goa. In the course of the same year 31 vessels arrived from the United Kingdom.—HAMILTON'S *East India Gazetteer*; *Geog. Dict.*, art. *Madras*; *Madras Almanac* for 1839, 1840, and 1845; *Official Returns of the Trade of Madras*, etc.

Maelstrom, or Moskoe-Strom, a whirlpool in the North Sea, near the Island Moskoe. In summer it is but little dangerous, but it is very much so in winter, especially when the north-west wind restrains the reflux of the tide. At such times the whirlpool rages violently so as to be heard several miles, and to engulf small vessels, and even whales, which approach it. See LOFODEN ISLANDS. See also FRASER'S *Mag.*, x., 267.

Magellan, or Magalhaens, Straits of, divide the continent of South America from the Island Tierra del Fuego; the east entrance is formed by Cape de la Virgines, on the mainland, and by Cape del Espiritu Santo (Queen Catharine's Foreland), on one of the largest islands composing Tierra del Fuego. Length nearly 300 miles, extending between lat. 52° 10' and 55° S., and long. 68° 20' and 75° W. Navigation difficult. Discovered in 1520 by Fernando Magalhaens. Ferdinand De Magellan, or Magalhaens, the discoverer of the straits that bear his name, was by birth a Portuguese. He served with honor in the East Indies, and in 1510 distinguished himself at the battle of Malacca. He entered into the employment of Charles V., King of Spain, and in conjunction with Ruy Foloero, formed the bold design of discovering a new passage by the west to the Molucca Islands. On the 20th September, 1519, he sailed from San Lucas, with five ships and 236 men. After many exertions, he induced two of his ships to prosecute the entire voyage; and entering upon the straits which now bear his name, he soon reached the South Sea. The weather was so uniformly temperate, and the sea so calm, that they called the ocean Pacific. Magellan visited places seen for the first time by Europeans; and in visiting Matan, the natives gave battle, and Magellan was slain, in the year 1521. But for this he would have been the first circumnavigator of the world, which honor was secured by Cano, who brought his ships home by the East Indies.

Magnesia (Fr. *Magnésie*; Ger. *Gebraunte Magnesia*; It. *Magnesia*), one of the primitive earths, having a metallic basis. It is not found native in a state of purity, but is easily prepared. It is inodorous and insipid, in the form of a very light, white, soft powder, having a specific gravity of 2.3. It turns to green the more delicate vegetable blues, is infusible, and requires for its solution 2000 parts of water at 60°. See MAGNESE.

Magnet. Sturmius, in his *Epistola*, dated at Altorf, 1682, observes that the attractive quality of the magnet has been taken notice of from time immemorial; but that it was Roger Bacon, of Ilchester, in

Somersetshire (he died the 17th June, 1294), who first discovered its property of pointing to the north pole. The Italians discovered that it could communicate its virtue to steel or iron. The variation not being always the same was taken notice of by Hevelius, Petil, and others. Flavio Gioja, of Naples, invented or improved the mariner's compass in 1302. The important discovery of the inclination or dip of the magnetic needle was made about 1576 (published 1580) by Robert Norman, of London. Dr. Gilbert's experiment was made in 1600. Artificial magnets were invented, or rather improved, in 1751. A magnetic clock, invented by Dr. Locke, of Ohio, announced at Washington, January 5, 1849. See COMPASS.

Magnolia. The *magnolia conspicua*, or lily-flowered magnolia, as its name indicates, is a beautiful and showy tree, and distinguishable from all others of the genus by the expanding of the flowers before any of the leaves. A full-grown tree, in its native country, is said to attain a height of forty or fifty feet, and it has arrived at nearly the same elevation in Europe and America. The tree was first introduced into England by Sir Joseph Banks, in 1789; but it was many years before it attracted much attention, being considered merely as a green-house or conservatory plant. Within the last 20 years, it has been discovered to be nearly as hardy as the American magnolias, and is now most extensively cultivated in the nurseries of Britain, continental Europe, and the United States. It flowers freely every year, as a standard in the neighborhood of London, New York, and Philadelphia, when the wood has been properly ripened during the preceding summer; and at White Knights, in England; at Fromont, and various other places in France; and at Monza, in Italy, and Brooklyn, in New York, it has ripened, seeds from which young plants have been raised. *Properties and Uses.*—Besides the value of the *magnolia conspicua* as an ornamental plant or tree, the Chinese pickle the flower-buds, after having removed their calyxes, and use them for flavoring rice. Medicinally, the seeds are taken in powder, in colds, and inflammations of the chest. It is also regarded as stomachic; and water, in which it has been steeped, is used for bathing the eyes when inflamed, and for clearing them of gum.

Geography and History.—The *magnolia glauca* has the most extensive range, especially near the sea, of any of the genus. It abounds from Massachusetts to Louisiana and Missouri. Its most northern boundary may be considered a sheltered swamp in Manchester, Cape Ann, about 30 miles northerly of Boston. It here attains but a small size, and is frequently killed to the ground by severe winters. In the maritime parts of the Floridas and lower Louisiana, it is one of the most abundant among the trees which grow in morasses or wet grounds. It is not usually met with far interior, nor to the west of the Alleghanies. In the Carolinas and Georgia it grows only within the limits of the pine-barrens. This species was introduced into England by Rev. John Banister, who sent it to Bishop Compton, at Fulham, in 1688. It was soon afterward generally propagated by American seeds, and became known throughout Europe many years before any of the other species. At Woburn Farm, Chertsey, there was formerly a row of these trees 20 feet high, and nearly a century old, which frequently ripened their seeds. In France, and southern Europe generally, this species is not very abundant, from the great heat of the summers, and the general dryness of the air. At Versailles and the Petit Trianon, as well as in Belgium, it has attained the height of 15 feet. In the north of Germany, and in Sweden and Russia, it is a green-house plant. At Monza, in Italy, it is found in all of its varieties. In general, this tree can only be used for ornamental purposes, and no collection should be without it. The wood, however, is sometimes employed for making

joiners' tools; and the bark is also used in some parts of the country, like that of the cinchona, in the case of intermittent and remittent fevers. It is aromatic and pungent, apparently more so than the other species. When distilled, it has a peculiar flavor, and an empyreumatic smell. In a dry state it affords a little resin. The aroma is volatile, and probably contains an essential oil, or a variety of camphor. The bark, seeds, and cones, are employed in tincture, in chronic rheumatism. That from the cones is very bitter, and is sometimes used to cure coughs and pectoral diseases, and for preventing autumnal fevers. The flowers in a dried state may be used in drawing-rooms for *pot pourri*, as a substitute for those of the lily of the valley.—BROWNE'S *Trees of America*.

Mahogany, the wood of a tree (*Swietenia Mahoganii*) growing in the West Indies and Central America. There are two other species of *Swietenia* found in the East Indies, but they are not much known in this country. Mahogany is one of the most majestic and beautiful of trees: its trunk is often 40 feet in length, and 6 feet in diameter; and it divides into so many massy arms, and throws the shade of its shining green leaves over so vast an extent of surface, that few more magnificent objects are to be met with in the vegetable world. It is abundant in Cuba and Hayti, and it used to be plentiful in Jamaica; but in the latter island, most of the larger trees, at least in accessible situations, have been cut down. The principal importations into Great Britain are made from Honduras and Campeachy. That which is imported from the islands is called Spanish mahogany; it is not so large as that from Honduras, being generally in logs from 20 to 26 inches square and 10 feet long, while the latter is usually from 2 to 4 feet square and 12 or 14 feet long, but some logs are much larger. Mahogany is a very beautiful and valuable species of wood; its color is a red brown, of different shades, and various degrees of brightness; sometimes yellowish brown; often very much veined and mottled, with darker shades of the same color. The texture is uniform, and the annual rings not very distinct. It has no larger septa; but the smaller septa are often very visible, with pores between them, which in the Honduras wood are generally empty, but in the Spanish wood are mostly filled with a whitish substance. It has neither taste nor smell, shrinks very little, and warps or twists less than any other species of timber. It is very durable when kept dry, but does not last long when exposed to the weather. It is not attacked by worms. Like the pine tribe, the timber is best on dry rocky soils, or in exposed situations. That which is most accessible at Honduras grows upon moist, low land, and is, generally speaking, decidedly inferior to that brought from Cuba and Hayti; being soft, coarse, and spongy, while the other is close-grained and hard, of a darker color, and sometimes strongly figured. Honduras mahogany has, however, the advantage of holding glue admirably well; and is frequently used as a ground on which to lay veneers of the finer sorts.

Not long since, Messrs. Broadwood, the piano-forte manufacturers of London, gave the immense sum of £3000 for three logs of mahogany! These logs, the produce of a single tree, were each about 15 feet long, and 38 inches square; they were cut into veneers of eight to an inch. The wood was particularly beautiful, capable of receiving the highest polish, and, when polished, reflecting the light in the most varied manner, like the surface of a crystal; and, from the wavy form of the pores, offering a different figure, in whatever direction it was viewed. Dealers in mahogany generally introduce an auger before buying a log; but, notwithstanding, they are seldom able to decide with much precision as to the quality of the wood, so that there is a good deal of lottery in the trade. The logs for which Messrs. Broadwood gave so high a price were brought to England with a full knowledge of

their superior worth. Mahogany was used in repairing some of Sir Walter Raleigh's ships at Trinidad, in 1597; but it was not introduced into use in England till 1724. The duty on foreign mahogany used to be £7 10s. a ton, on Honduras, £1 10s., and on Jamaica mahogany, £4—its effect being to force the consumption of the inferior in preference to the superior article. Luckily, however, the duty on foreign and colonial mahogany, after being reduced in 1845 to 20s. and 5s. a ton, was wholly repealed in 1845. There has been, in consequence, a very great increase in the consumption of the superior sorts of mahogany for upholstery purposes, while the cheaper varieties are now largely employed, notwithstanding the difficulties thrown in the way by Lloyd's regulations, in the construction of ships, and in coarser fabrics. In 1840 the imports amounted to 23,115, and in 1852 to 41,090 tons, the re-exports during the latter year being only 2755 tons. Honduras, Cuba, and Hayti, are the great sources of supply; the timber brought from the first being the cheapest and by far the most abundant. See TREDGOLD'S *Principles of Carpentry*, p. 204; *Library of Entertaining Knowledge*, volume on *Timber-trees and Fruits*; EDWARDS'S *West Indies*, vol. iv., p. 208, ed. 1819, etc.; and the *Mahogany Tree*, by Messrs. CHALONER and FLEMING; *Living Age*, xxix., 354.

The imports of mahogany and other woods into the United States for the fiscal year ending June 30th, 1856, were as follows:

Imports.	Manufactured.	Unmanufactured.
Cabinet furniture.....	\$46,781
Cedar, mahogany, etc.....	22,307	\$440,246
Willow.....	125,808	86,554
Cork.....	302,567	9,180
Dye woods.....	796,802
Others not specified.....	429,915	25,157
Total.....	\$827,378	\$1,807,889

There are several varieties of mahogany, much admired, and sought after, for the beauty of their figures, and the gradations of their colors, which may be described as follows:

1. **PLAIN MAHOGANY.** *Acajou uni* of the French, the wood of which is of one color, and equal throughout. 2. **VEINY MAHOGANY.** *Acajou veiné*, French. The wood of this variety is veined longitudinally with the grain, displaying alternately dark and light streaks, continuous, interrupted, or re-appearing. 3. **WATERED MAHOGANY.** *Acajou moiré*, French. This variety is known by the transverse waves which exhibit to the eye an effect similar to those of a watered ribbon. 4. **VELVET-CORD, or CATERPILLAR MAHOGANY.** *Acajou chenillé*, French. This variety is distinguished by its whitish lines, accompanied by a figured shade of fragments of roseate sprigs, here and there disposed diagonally, longitudinally, interrupted, or crossing one another. 5. **BIRD'S-EYE MAHOGANY.** *Acajou moucheté*, French. This variety is besprinkled with little oval knots, which, when duly proportioned, render the wood half light and half dark. 6. **FESTOONED MAHOGANY.** *Acajou ronceux*, French. This variety offers in its color a mixture of light and shade usually resembling sheaves of wheat, feathers, wreaths, festoons, or figures of shrubs. As the wood of mahogany is generally hard and takes a fine polish, it is found to serve better than that of any other tree for cabinet-making, for which purpose it is universally admired. It is very strong, and answers well for beams, joists, planks, boards, and shingles, for which it was formerly much used in Jamaica. Its adaptation to ship-building we have already mentioned in the history of this tree.—BROWNE'S *Trees of America*.

Maine, the most north-easterly State of the republic of the United States of America, extends from lat. 43° to 47° 24' N., and between long. 6° and 10° E. from Washington, and contains an area of 85,000 square miles. Population in 1790 was 96,540; in 1800, 161,719; in 1810, 228,705; in 1820, 298,395; in 1830, 399,995; in 1840, 501,793; and in 1850, 583,088.

Sebastian Cabot, who was, after the time of Columbus, the first European navigator along the coasts of Maine and its vicinity, appears not to have given a name to the countries discovered by him. The eldest and greatest name in these parts of North America is that of "*Baccalaos*"—a name given by the Biscay fishermen at first to Newfoundland, and then also to all the countries which they found near this island. On some old maps the name "*Baccalaos*"—that is to say, the cod-fish coast—reaches over a great part of the eastern coast of America, but it appears more particularly in the regions of our State of Maine. Stephen Gomez was the first Spanish navigator who discovered (1525) and explored the coasts to the west and to the north of Cape Cod a little more particularly, and we therefore see on the Spanish maps these regions designated with the name of "*Tierra de Gomez*" (Gomez's Land). So, for instance, at first on that of Ribiero (1529), and afterward on many others. After the middle of the 16th century, when Gomez was more and more forgotten, another name was introduced for these regions—that of "*Norumbec*." We can not exactly point out the occasion at which this name was invented; but we find it in the latter half of the 16th and in the beginning of the 17th century, on nearly all the maps of these regions. The name seems to be of Indian origin, like the name of Kennebec, Quebec, and different others which have *bec* for the last syllable. Perhaps some unknown sailors heard it pronounced by the Indians, and introduced it among the geographers, who were always fond of new names. It was, however, changed and spelled in many different ways: Norubec, Norumbec, Arambec, Norumberge, Norumberque, Norimbequa, etc.

The savans of the time supposed that there was in the interior of this northern country a large city of the same name, like that old famed "*Temistitan*," in Mexico, and that through this city was running a large broad river, which was also called the River of Norumberge. It is probable that with this name our Penobscot Bay and its rivers were designated. They from this, therefore, called the whole country "*La Terre de Norumberque*," or the coasts of Arambec.

English Settlers.—At the same time the English introduced here another name, that of Virginia, under which they comprised, since 1584, pretty much the whole Atlantic coast of North America. Custom and use already introduced very soon a division in the Southern and the Northern Virginia coast. The royal patent of 1606, by which the two Virginia companies were established, made this custom legal and official. After this patent the whole section of the country north of the 40th degree of latitude, comprising our Maine, was designated as "Northern Virginia," or also, since some attempts at settlement, "the Northern Plantations," or also "the Second," or "Plymouth Colony," because the king had given this latter name to that particular society of merchants who had taken upon themselves the exploration and settlement of Northern Virginia. In the year 1616 the name of "New England" was introduced. The celebrated Captain John Smith was no doubt the inventor of it, and Prince Charles approved of it. Smith says this himself in his history of New England, and states that he gave this name, which made some opposition against the neighboring French name of "New France" and the French pretensions; and, secondly, he did it in contraposition to the country on the Pacific side of America which was discovered by Drake, and named by him New Albion, and which was under the same latitude.

Sir Fernando Gorges gave, in the year 1636, to the territory between Piscataqua and Kennebec Rivers, the name of "New Somersetshire," from the shire in England where he was born. Sometimes the whole vast region was therefore then called "Somersetshire;" and we find, even when the name of Maine was already introduced, once the expression "Maine

or Somersetshire." In the same way the whole of Maine was also sometimes called "Lacona," from a part of the country to which this name was given for a time. We find on a map by Seller, of the beginning of the 18th century, written with great letters, "the Province of Lacona or Maine." The early English settlers on the coast of New England had for Maine the popular name of "the Eastern shore," or "the Eastern country."

The name Maine was first introduced in the year 1639, when King Charles I. granted to Sir Fernando Gorges all the land from Piscataqua River to Sagadahoc, to which tract of land he gave the name "Province of Maine," "in compliment to the Queen of Charles I. who was a daughter of France, and owned as her private estate the province of Maine in France." This, at least, is the opinion of the first good historian of Maine, Mr. Sullivan. But Sullivan gives no authority for this opinion, which has, however, been adopted as a pretty general and popular one. The truth seems to be that it can not be proved that Queen Henrietta Maria had any rights at all in Maine. An old author on Maine observes, "it is very curious that the name of our country has been made shorter by an 'e' than the French Maine." In fact the word is, in old documents, very commonly written "Main" or "Mayn." From this, one could be induced to suppose that the name originated in the English expression for *terra firma* or continent: "Main" or "Mainland." Nearly all the first English trading and fishing establishments along the shore were on the numerous islands of the coast. From there the explorers made excursions "to the Main," to trade with the Indians and to explore the country. There are innumerable allusions, in their traveling reports, to "the Mayn." Could not from this have grown the custom of calling the country "Main?" From similar reasons and circumstances the north coast of South America is called by the inhabitants of the Antilles and Caribbean Islands, "*Costa firme*," or "*Tierra firme*."—J. G. KOHL.

The name Maine extended at first only a small distance along the coast. By degrees, and in the course of time, in consequence of growing settlements and of many treaties and grants, it was subsequently extended as far east as Penobscot Bay, and at last as far as St. Croix River, and in the year 1819 the "Province of Maine" was erected into the "State of Maine."

There were in this State in 1850, 2,039,596 acres of land improved, and 2,515,797 of unimproved land in farms; cash value of land in farms, \$54,861,748; and the value of implements and machinery, \$2,284,557. *Live Stock.*—Horses, 41,721; asses and mules, 45; milch cows, 133,556; working oxen, 83,893; other cattle, 125,890; sheep, 451,577; swine, 54,598; value of live stock, \$9,705,726.

Agricultural Products, etc.—Wheat, 296,259 bushels; rye, 102,916; Indian corn, 1,750,056; oats, 2,181,037; barley, 151,781; buckwheat, 104,523; peas and beans, 205,541; potatoes, 3,436,040; value of products of the orchard, \$342,865; produce of market gardens, \$122,387; pounds of butter made, 9,243,811; of cheese, 2,434,454; maple sugar, 93,542 pounds; molasses, 3,167 gallons; beeswax and honey, 139,618 pounds; wool, pounds produced, 1,864,034; flax, 17,081; silk cocoons, 252; hops, 40,120 pounds; hay, tons of, 755,889; clover seeds, 9,097 bushels; other grass seeds, 9,214; flax seed, 580 bushels; and were made 724 gallons of wine; value of home-made manufactures, \$513,599; of slaughtered animals, \$1,646,773.

Rivers, Lakes, etc.—It has been estimated that one sixth part of the surface of Maine consists of water. There are numerous lakes, the largest and most noted of which are Moosehead, Sebago, Chesuncook, and Umbagog. A part of the waters of the latter extend into New Hampshire. Some of these lakes are justly celebrated for the picturesque beauties of their scenery. A steamboat has been built to ply on the waters

of Moosehead Lake. The Kennebec and the Penobscot are the two most important streams; the former is navigable to Augusta, and the latter to Bangor. Their shores are adorned with villages, and the *intervals* along their margins are the most fertile and best cultivated in the State. The Saco, Androscoggin, and St. Croix Rivers enter the Atlantic. St. John, and its confluent, the Wallowastook, Allagash, and Aroostook, drain the northern part of the State. The St. John forms a part of the northern part of the State by the late treaty of Washington, and its waters are open to the free navigation of both nations. The principal bays are Casco, Penobscot, Machias and Passamaquoddy.

Manufactures.—There were in this State in 1850, 13 cotton factories, with a capital invested of \$3,347,700, employing 849 males and 3,072 females, producing 83,168,556 yards of sheeting valued at \$2,630,616; 45 woolen factories, with a capital of \$644,200, employing 388 males and 390 females, manufacturing 2,926,320 yards of cloth, and 1,200 lbs. of yarn, valued at \$934,928; 1 establishment making pig-iron, with a capital of \$214,000, employing 71 persons, producing 1,484 tons of pig-iron, etc., valued at \$36,616; 25 establishments, with a capital of \$150,100, employing 244 persons, and making 3,691 tons of castings, valued at \$265,000; 163 flouring and grist mills, 752 saw

mills; 213 tanneries, with a capital of \$782,447, employing 780 persons; value of products, \$1,620,636; 45 printing offices, 4 daily, 3 tri-weekly, 4 semi-weekly, 43 weekly, and 1 monthly publication; aggregate number of copies published annually, 4,203,064. Capital invested in manufactures, \$14,700,452; value of manufactured articles, \$24,644,430.

There were, January 1856, 11 railroads in this State; 494 miles completed and in operation, and 90 miles in course of construction. The only canal in the State is the Cumberland and Oxford, 20½ miles long, connecting navigation from Portland to Sebago, and by a lock in Saco River, navigation is extended to Long Pond, 30 miles further.

The receipts on the principal lines of railroad in Maine, during the last four years, have been as follows:

	Length.	1853.	1854.	1855.	1856.
	Miles.	Dollars.	Dollars.	Dollars.	Dollars.
A. and St. L.....	147	316,138	470,647	552,488	565,158

1. The principal ports are *Portland*, city and port of entry, situated on a peninsula at the western extremity of Casco Bay; lat. (Mount Joy), 43° 39' 52" N., long., 70° 13' 34" W. The harbor is capacious and safe, and among the best on the Atlantic coast. It is protected by islands from storms, seldom obstructed by ice, and has a good entrance. The water is deep enough for vessels of the largest class. The tonnage of the port in 1856, was 136,154 tons. 2. *Bath*.—On the Kennebec, 12 miles from the ocean, is one of the principal towns of the State, and the largest ship-

building port in the world. A branch of the Kennebec and Portland Railroad connects the city with Portland. The tonnage of the port is the largest in Maine, and in 1856 amounted to 193,320 tons. 3. *Belfast*.—At the head of Belfast Bay, 30 miles from the ocean, has an excellent harbor, and a considerable trade in lumber and fish. Its chief industry, however, is ship-building. Steamboats ply to Portland and Boston. The tonnage of Belfast, in 1856, was 76,812 tons. 4. *Bangor*, on the Penobscot. Tonnage in 1856, 38,048 tons.

Finances of the State.—The whole amount of the funded debts of the State, December 31, 1856, was \$699,000; of that sum \$30,000 became due March 1, 1857, and the current expense of the year will be discharged, without resorting to other means than the usual tax imposed by the Legislature. No Legislature will be required to provide for the payment of that sum. Receipts and disbursements for the year ending December 31, 1856. Receipts, balance from year 1855, \$39,130 37. From all other sources, \$593,312.04. Total, \$632,442 41. Disbursements, \$486,165. Balance in the treasury, \$146,277 41. See *North Am. Rev.*, lviii., 299 (SABINE), xxxvii., 419 (LEONARD), iii., 362 (RAND); *NILES's Reg.*, xl., 399 (H. CLAY); *HUNT's Mag.*, ii., 313 (LANMAN), xvii., 577; *Jo. of Sc.*, xxxvii., 143; *Am. Quar. Reg.*, v., 105, x., 154, xiv., 148, xlii., 144; *Am. Whig Rev.*, ii., 262; *De Bow*, xii., 603; *New Eng. Mag.*, ii., 394.

Maize, or Indian Corn (*Fr. Bled de Turquie*; *Ger. Türkisch korn, Mays*; *It. Grano Turco o Siciliano*; *Sp. Trigo de Indias, Trigo de Turquía*), one of the cereal grasses (*Zea Mays*), supposed to be indigenous to South America, being the only species of corn cultivated in the New World previously to its discovery. It was introduced into the Continent about the beginning, and into England a little after the middle of the 16th century. Its culture has spread with astonishing rapidity; being now extensively grown in most Asiatic countries, and in all the southern parts of Europe. It has the widest geographical range of all the cerealia, growing luxuriantly at the equator, and as far as the 50th degree of north, and the 40th of south latitude. It has been raised in England, in nursery gardens near the metropolis, for more than a century; and recently it has been attempted to raise it in the fields, but with indifferent success. Like other plants that have been long in cultivation, it has an immense number of varieties. The ear consists of about 600 grains, set close together in rows, to the number of 8, 10, or 12: The grains are usually yellow; but they are sometimes red, bluish, greenish, or olive-colored, and sometimes striped and variegated. The maize of Virginia is tall and robust, growing 7 or 8 feet high; that of New England is shorter and lower; and the Indians further up the country had a still smaller sort in common use. The stalk is jointed like the sugar cane. The straw makes excellent fodder; and the grain, as a bread corn, is liked by some; but though it abounds in mucilage, it contains little or no gluten, and is not likely to be much used by those who can procure wheat or even rye bread. See CORN.

Malachite. Until 1851, so little was known about it, except to mineralogists, that the public knew not whether it was a stone or a composition. The industrial history of the substance, however, is exceedingly curious. Malachite is a peculiar variety of green carbonate of copper, found in a few localities in Siberia and South Australia. It is softer but heavier than marble, and much more difficult to work. It can rarely be found in masses weighing more than from 10 to 20 pounds; and the finer specimens have a very high value. There is a mine in Siberia, where a mass of malachite, supposed to weigh 500,000 pounds, lies imbedded at a depth of 280 feet in a copper mine; and there is every indication that the malachite has been formed by the solidification or petrefaction of a liquid carbonate of copper, on some such principle as the stalactites in the Derbyshire caves. The material breaks so readily, that it is generally pieces of only two or three pounds' weight that can be brought safely to light.

MM. Demidoff, the owners of this valuable mine, have established a malachite manufactory at St. Petersburg. The production of large doors, or vases, or other articles in this substance, is exceedingly difficult. The fragments of malachite are first sawn into

thin plates, the thickness of which varies from a twelfth to an eighth of an inch. The cutting is effected by vertical circular saws, controlled by very delicate machinery, and moistened with sand and water. For curved surfaces, the malachite is cut by bent saws of a peculiar kind, the working of which is extremely precarious and difficult. The malachite has markings in different tints of green, which give to the material no small part of its beauty. The artistic workman determines what convolution or pattern these markings shall present in the finished article; and he so selects the veneers or small pieces as to attain that end. The pieces are cut at the edges to join with great nicety; and to make these joints accord better with the markings, they are often made curved. The grinding of the edges is effected by the aid of rapidly-revolving copper wheels. The substance on which the malachite is veneered is generally iron or copper, but sometimes stone or marble. When the pieces have been fixed down with cement, small interstices are filled up with a cement mixed with fragments of malachite, and colored with a powder of the same material. After this the surface is ground and polished. The price of the raw malachite, in average pieces as brought up from the mine, is about \$3 50 to \$4 per pound; but very great waste occurs in the working; and this, coupled with the lengthened time required in the working, will account for the great costliness of doors, vases, etc., made in this material. The malachite doors which occupied so prominent a place in the Great Exhibition, London, employed 30 workmen for a whole year.

Malaga, a city and sea-port of Spain, in the kingdom of Granada, in lat. 36° 43' N., long. 4° 25' 7" W. Population, perhaps, 65,000. Malaga has an excellent harbor. It is protected on its eastern side by a fine mole, full 700 yards in length. At its extremity a light-house has been constructed, furnished with a powerful light, revolving once every minute. At a distance it appears obscured for 45 seconds, when a brilliant flash succeeds for the other 15 seconds. A shoal has grown up round the mole-head; and the depth of water throughout the harbor is said to be diminishing. Latterly, however, a dredging-machine has been employed to deepen it, by clearing out the mud and accumulating sand. The depth of water at the entrance of the harbor and within the mole is from 26 to 30 feet; and close to the city from 8 to 10 feet. The harbor could easily accommodate more than 450 merchant ships: it may be entered with all winds, and affords perfect shelter. Owing to the want of official returns, and to the prevalence of smuggling, which may be said to have annihilated all fair trade, it is not possible to obtain any accurate accounts of the trade of Malaga, or indeed of any Spanish port. The great articles of export are wine and fruits, particularly raisins and almonds, grapes, figs, and lemons; there is also a considerable exportation of olive oil, with quantities of brandy, anchovies, cummin-seed, aniseed, barilla, soap, etc. The lead exported from Malaga is brought from Adra. The imports are salt fish, iron hoops, bar iron, and nails; cotton stuffs, hides, earthenware, etc., with dye stuffs, all sorts of colonial produce; butter and cheese from Holland and Ireland, linen from Germany, etc. The trade with England seems to be diminishing, and that with the United States to be increasing. This is a consequence, no doubt, of Malaga wine being very little in demand in the former, while it is pretty largely consumed in the latter. The Americans are also the largest consumers of Malaga fruit. See MARCET'S *Com. Rel. U. S.*, vol. ii., pp. 63, 64, published 1856-7.

Commerce with the United States.—The following table will show, approximately, to what extent the direct trade between the United States and Spain has fallen off within the past few years. Most of this trade is carried on through the port of Malaga:

TONNAGE OF AMERICAN VESSELS ENTERED AT THE PORT
OF MALAGA IN THE FOLLOWING YEARS.

Years.	Tons.	Years.	Tons.
1846.....	15,276	1850.....	16,600
1847.....	12,285	1851.....	11,918
1848.....	15,699	1852.....	12,610
1849.....	13,652	1853.....	11,375

The falling off in tonnage which the above table exhibits is, however, perfectly reconcilable with the com-

EXPORTS FROM MALAGA TO THE UNITED STATES FROM 1ST JANUARY TO 1ST JULY, 1854.

The following extracts are taken from the commercial report of Malaga, dated the 31st of January, 1857, communicated to the Department of State: "The imports from the United States, which are usually limited to staves by American, and one or two cargoes of cotton by Spanish vessels, have been increased by a few cargoes of flour and wheat, toward the end of the year, under the late royal decree admitting breadstuffs free of duty until June next; the approximate value of imports of American produce for the last year amounted to \$228,030, and of foreign produce from the United States to 32,700, making a total sum of \$260,730. The exports to the United States have not been large in quantity, owing to short crops the past year. The high price of every article of exportation, however, brings up the value equal to any former period. The amount, as per proximate returns of American vessels, is \$1,240,907, and by foreign vessels \$407,360; making a total sum of \$1,648,267. The raisin crop has been very short, the last vintage being estimated at not much over 600,000 boxes of Muscatels. Other descriptions of raisins show a still greater decrease, owing to the ceniza, a disease of the vines which has been very general the two last years. The culture of the grape is extending throughout the province; and the Muscatel vines would probably yield, in a favorable season 1,500,000 boxes. Over two thirds of this description have been shipped the last year to the United States: the finer quality is shipped to England and France; and when very abundant, at low prices, large shipments would be made to Germany and the north of Europe. Prices have ruled very high, averaging \$2 for M. R., and \$2 25 for ordinary layers, for the American market; fine London layers from \$3 to \$4 per box. The stock existing at the end of the year did not exceed 30,000 boxes, about two thirds of which may go to the United States. The various productions of this and the adjoining provinces, for want of good roads and rapid communication in a mountainous country, can not be brought to market so as to compete with the same of other countries, consequently they are not increased. Outside of five or eight leagues, little is received, but at such a high cost of transportation that many bulky articles can not be brought at all. Sumac, for instance, is worth, in the interior, from 20 to 25 per arroba, or 25 pounds. The freight of this article to Malaga is more than double the cost. It is considered by chemists of a better quality than the Sicily, but it can not be afforded for the American market, although, notwithstanding the high cost, considerable is shipped to France."

The following details, extracted from Mr. Inglis's valuable work, entitled "Spain in 1830," contain the fullest and best account we have met with of the trade of Malaga. The authenticity may, we believe, be depended upon:

"Wine.—The wines of Malaga are of two sorts, sweet and dry; and of the former of these there are

four kinds; first, the common 'Malaga,' known and exported under that name. In this there is a certain proportion of boiled wine, which is allowed to burn, and which communicates a slightly burnt taste to the 'Malaga.' The grape from which this wine is made is a white grape; and every pipe of 'Malaga' contains no less than eleven gallons of brandy. Secondly, 'Mountain.' This wine is made from the same grape as the other, and, like it, contains coloring matter and brandy; the only difference is, that for 'Mountain' the grape is allowed to become ripe. Thirdly, 'Lagrimas,' the richest and finest of the sweet wines of Malaga; the name of which almost explains the manner in which it is made. It is the droppings of the ripe grape hung up, and is obtained without the application of pressure. The dry wine of Malaga is produced from the same grape as the sweet wine, but pressed when greener. In this wine there is an eighth part more of brandy than in the sweet wine; no less than 1-12th part of the dry Malaga being brandy. The whole produce of the Malaga vineyards is estimated at from 35,000 to 40,000 pipes; but, owing to the increasing stock of old wine in the cellars, it is impossible to be precise in this calculation. The exports of all sorts of Malaga wine may be stated at about 27,000 pipes. The principal market is the United States and South America; and to these the export is upon the increase. The average price of the wines shipped from Malaga does not exceed \$35 per pipe; but wines are occasionally exported at the price of \$170. Many attempts have been made at Malaga to produce sherry, but none with perfect success. The sherry grape has been reared at Malaga upon a soil very similar to that of Xeres; but the merchants of Malaga have not ventured to enter the wine for export. One reason of the very low price of the wines of Malaga is to be found in the cheapness of labor: field labor is only 2½ reals a day (10 cents). In the fruit and vintage time it is about double.

"Fruit.—Next to its wines, the chief export of Malaga is fruit, consisting of raisins, almonds, grapes, figs, and lemons; but of these, raisins are principally exported. I have before me a note of the exports of Malaga for the months of September and October, 1830—the chief, though not the sole exporting months—and I find that during that time the export of raisins amounted to 268,845 boxes, and 31,916 smaller packages. Of this quantity 125,334 boxes were entered for the United States; 45,513 for England; the remaining quantity being for France, the West Indies, the Spanish ports, South America, and Holland. The raisins exported from Malaga are of three kinds, *muscatel*, *bloom* or *sun raisin*, and *lexias*. The muscatel is the finest raisin in the world. In its preparation no art is used; the grape is merely placed in the sun, and frequently turned. The bloom or sun raisin is a different grape from the muscatel, but its preparation is the same. The lexias acquire this name from the

liquor, or ley, in which they are dipped, and which is composed of water, ashes, and oil; these, after being dipped, are also dried in the sun. All muscatel raisins are exported in boxes, and also a part of the bloom raisins. In 1829, the exports of muscatel and bloom raisins were 325,000 boxes of 25 lbs. each; in all, 8,125,000 lbs. This quantity is independent of the export of bloom raisins in casks, and of lexias; the latter amounting to about 30,000 arrobas. The export of raisins to England has fallen off, while that to America has considerably increased. In 1824, 75 ships cleared from Malaga for England, with fruit; in 1830, down to the 1st of November, 34 vessels had cleared out. Of the other fruits raised near Malaga, grapes, almonds, and lemons are the most extensively exported. In the months of September and October, 1830, 11,612 jars of grapes were shipped for England, 6429 for America, and 1650 for Russia. During the same months, 5335 arrobas of almonds (183,375 lbs.) were shipped for England, this being nearly the whole export. There were also exported during the same period 3749 boxes of lemons for England, 4201 boxes for Germany, and 840 boxes for Russia.

"*Oil*—There is also a large export of oil from Malaga; but the export during the latter part of 1830 would be no criterion of the average, because the Greenland whale-fishery having failed, extensive orders had been received from England."

Money.—Accounts are kept in reals of 34 maravedis vellon. For the coins, and their value, used at Malaga, see CADIZ.

Weights and Measures.—The weights are the same as those of Cadiz. The arroba or cantara = 4.19 English wine gallons; the regular pipe of Malaga wine contains 85 arrobas, but is reckoned only at 34; a bota of Pedro Ximenes wine = 5½ arrobas; a bota of oil is 43, and a pipe 35, arrobas; the latter weighs about 860 lbs. avoirdupois; a carga of raisins is 2 baskets, or

7 arrobas; a cask contains as much, though only called 4 arrobas; as a last for freight are reckoned—4 botas or 8 pipes of wine or oil; 4 bales of orange-peel; 5 pipes of Pedro Ximenes wine or oil; 10 casks of almonds (each about 380 lbs., English); 20 chests of lemons and oranges; 22 casks of almonds (of 8 arrobas each); 44 casks of raisins (of 4 arrobas each); 88 half casks of raisins; 50 baskets or 160 jars of raisins.

Port Charges.—The port and harbor dues amount, on an English vessel of 300 tons, to about £21; on a Spanish vessel of the same burden they would be about £11 10s.

Warehousing.—Goods may be warehoused for 12 months, paying 2 per cent. ad valorem in lieu of all charges; but at the end of the year they must be either entered for consumption or re-shipped. The 2 per cent. is charged whether they lie a day or the whole year. See also TOWNSEND'S *Travels in Spain*, vol. iii., pp. 10-42.

Malsley See WINE.

Malt (Ger. *Maly*; Du. *Mout*; Fr. *Mal*, *Blédgermé*; It. *Malto*; Sp. *Cebada retonada ó entallecida*; Rus. *Solod*; Lat. *Maltum*). The term malt is applied to designate grain which, being steeped in water, is made to germinate to a certain extent, after which the process is checked by the application of heat. This evolves the saccharine principle of the grain, which is the essence of malt. The process followed in the manufacture is very simple. Few changes have been made in it; and it is carried on at this moment very much in the same manner that it was carried on by our ancestors centuries ago. Rice, and almost every species of grain, has been used in malting; but in Europe, and especially in England, malt is prepared almost wholly from barley. It is the principal ingredient in the manufacture of beer, and is little used except in brewing and the distillation of spirits. Its consumption in the United States is rapidly increasing.

Owing to malt liquor having early become the favorite beverage of the people of England, the manufacture of malt has been carried on in that country, for a lengthened period, on a very large scale. Instead, however, of increasing with the increasing wealth and population of the country, it was nearly stationary for the 100 years ending with 1816. In proof of this we may mention that the quantity of malt that paid duty in England and Wales, at an average of the 12 years ending with 1720, was 24,191,804

bushels a year; whereas the annual average quantity that paid duty during the 12 years ending with 1816, was only 23,197,754 bushels. This apparently anomalous result is probably in some measure to be accounted for by the increased consumption of tea and coffee; but there can not be a question that it is mainly owing to the exorbitant duties with which malt, and the ale or beer manufactured from it, have been loaded, and to the oppressive regulations imposed on the manufacture of malt and the sale of beer. But

the public attention being at length forcibly attracted to the subject, and the effect of the exorbitant duties on malt and beer in increasing the consumption of ardent spirits having been clearly pointed out (see *Edinburg Review*, No. 98), the beer duty in Great Britain was repealed in 1830.

Malta, an island in the Mediterranean, belonging to the British, nearly opposite to the southern extremity of Sicily, from which it is about 64 miles distant. Valetta, the capital, is situated on the north coast of the island, the light-house in the castle of St. Elmo being in lat. $35^{\circ} 54' 6''$ N., long. $14^{\circ} 31' 1''$ E. Malta is about 20 miles long, and 10 or 12 broad. The island of Gozo, about a fourth part of the size of Malta, lies to the north-west of the latter, at about four miles' distance; and in the strait between them is the small island of Cumino. In 1847 the population of Malta amounted, excluding the garrison (except the Maltese regiment), to 108,140. The population of Gozo, at the same period, was 15,130; the total population of both islands making 123,270. The entire revenue collected in Malta usually amounts to about £100,000 a year, of which about £23,000 is derived from the rent of lands. Valetta, the capital of the island, is defended by almost impregnable fortifications. "These," says Mr. Brydone, "are, indeed, most stupendous works. All the boasted catacombs of Rome and Naples are a trifle to the immense excavations that have been made in this little island. The ditches, of a vast size, are all cut out of the solid rock; these extend for a great many miles, and raise our astonishment to think that so small a State has ever been able to make them." (*Tour through Sicily and Malta*.) Since the island came into the possession of Great Britain, the fortifications have been considerably improved; so that at present it is a place of very great strength. After the capture of Rhodes by the Turks, the Emperor Charles V. made a present of Malta to the Knights of St John of Jerusalem, in whose possession it remained till 1798, when it was taken by the French. It was taken from the latter by the English in 1800, and was definitely ceded to Great Britain in 1814. The island consists mostly of a rock, very thinly covered with soil, a good deal of which has been brought, at an immense expense, from Sicily; but being cultivated with the utmost care, it produces excellent fruits, particularly the celebrated Maltese oranges, corn, cotton, with small quantities of indigo, saffron, and sugar. The principal dependence of the inhabitants is on their cotton; the crop of which, amounting to about 4,000,000 lbs. a year, is partly exported raw, and partly manufactured to the value of from \$400,000 to \$500,000. The corn raised on the island is not sufficient to feed the inhabitants for more than five or six months, and, at an average, about 100,000 quarters of foreign wheat are required for their use. In addition to corn, cattle, provisions of all sorts, including dried fish, fruits, Spanish peas, etc., are largely imported. The other leading articles of import comprise cottons and most sorts of manufactured goods, sugar, coffee, and other colonial products, tobacco, oil, wines, timber, etc. The trade in corn used to be monopolized by government; and after the monopoly was abandoned, duties on importation, varying, like those in this country, with the price, were imposed. But in 1835 these duties were abolished, and the fixed duties on corn entered for consumption, specified in the subjoined tariff, were substituted in their stead. Malta presents unusual facilities, which have not hitherto been taken proper advantage of, for becoming the entrepôt of the corn trade of the Mediterranean and Black Sea. Her warehouses for corn are, like those of Sicily and Barbary, excavated in the rock; and are, perhaps, the best fitted of any in Europe for the safe keeping of corn. The wheat lodged in them may be preserved for an indefinite period; and it is affirmed that though it

should, on being deposited, be affected by the weevil, it is very soon freed from that destructive insect. It is not often that corn can be brought direct from Odessa, Taganrog, etc., to England, without the risk of being damaged; but were it brought, in the first instance, to Malta, and bonded there, it might afterward be conveyed in the best order to the English market. Malta is also admirably well suited for becoming a centre of the corn trade of Egypt, Barbary, Italy, etc. During the wars of 1800-1815, particularly during the period when Napoleon's anti-commercial system was in operation, Malta became a great entrepôt for colonial and other goods, which were thence conveyed, according as opportunities offered, to the adjacent ports. This commerce ceased with the circumstances that gave it birth; and for some years after the return of peace, the trade of the island was depressed below its natural level, by the imposition of various oppressive discriminating duties. In 1819, this vexatious system was partially obviated; but it continued to exert a pernicious influence till 1837, when, pursuant to the recommendation of the commissioners of inquiry, the then existing tariffs of customs duties and port charges were wholly abolished, and a new tariff was issued in their stead. It imposed moderate duties, for the sake of revenue only, on a few articles in general demand, without regard to the country whence they came, at the same time that it equalized the tonnage duties, and reduced the warehouse rent on articles in bond to the lowest level. There are some good springs of fresh water! Valetta is partly supplied by water brought by an aqueduct a distance of about six miles, and partly by the rain collected in cisterns.

Harbor.—The harbor of Valetta is double, and is one of the finest in the world. The city is built on a narrow tongue of land, having the castle and light of St. Elmo at its extremity, and an admirable port on each side. That on the south-eastern side, denominated the grand port, is the most frequented. The entrance to it, about 250 fathoms wide, has the formidable batteries of St. Elmo on the one hand, and those of fort Ricasoli on the other. In entering, it is necessary not to come within 50 or 60 fathoms of the former, on account of a spit which projects from it; but in the rest of the channel there is from 10 to 12 fathoms water. The port, which runs about $1\frac{1}{2}$ miles inward, has deep water and excellent anchorage throughout; the largest men-of-war coming close to the quays. Port Marsmusceit, on the north-western side of the city, is also a noble harbor. The entrance to it, which is about the same breadth as that of the grand port, is between St. Elmo and Fort Tiqua. In the centre of the basin is an island on which are built a castle and a lazaretto, for the convenience of the ships performing quarantine, by which the port is principally used. Owing to the narrowness of the entrance, and the usual variable-ness of the wind, it is customary for most vessels bound for Valetta to take a pilot on board before entering the harbor.

The central position, excellent port, and great strength of Malta, make it an admirable naval station for the repair and accommodation of the men-of-war and merchant-ships frequenting the Mediterranean, and render its possession of material importance to the British empire. Since Malta-built vessels were admitted into ports of the United Kingdom on the same terms as those of British-built, the trade of ship-building has materially increased in the island. The Maltese shipwrights are diligent, expert workmen; and, their wages being moderate, it is a favorable place for careening. Owing to the want of a dry dock, all ships above the size of a sloop of war, that require to have their bottoms examined, have to come to England for that purpose. This, surely, should be obviated. Quarantine is strictly enforced at Malta; but there is every facility for its performance, and the charges are less than at any other port in the Mediterranean.

Malta is now the centre of a very extensive steam-packet system; the steamers from England for the Ionian Islands, Constantinople, Alexandria, and other ports of the Levant, touching here. The French

steamers from these ports usually perform quarantine at Malta.

Money.—In 1825, British silver money was introduced into Malta; the Spanish dollar being made legal tender at the rate of 4s. 4d.; the Sicilian dollar at 4s. 2d.; and the scudo of Malta, at 1s. 8d.

Weights and Measures.—The pound, or rottolo, commercial weight = 30 oncie = 12·216 English grains. Hence 100 rottoli (the cantaro) = 174½ lbs. avoirdupois, or 79·14 kilog. Merchants usually reckon the cantaro at 175 lbs. The salma of corn, stricken measure = 8221 Winchester bushels; heaped measure is reckoned 16 per cent. more. The caffiso, or measure for oil, contains 5½ English gallons = 20·818 litres. The barrel is double the caffiso. The Maltese foot = 11 1-6th English inches = 2836 metres. The canna = 8 palmi = 81·9 English inches = 2·079 metres. Merchants usually convert Malta measure into English in the proportion of 3½ palmi to a yard, or 2 2-7th yards to 1 canna.

Bills on London are usually drawn at 30 and 60 days' sight. The deputy commissary general is obliged to grant, at all times, bills on the Treasury here for British silver tendered to him, at the rate of a £100 bill for every £101 10s. silver, receiving, at the same time, other silver, at a fluctuating rate of exchange.

Commercial Relations with the United States.—The commercial intercourse of the United States with Malta is dependent, as is that of all other nations, on the regulations and legislative enactments of the mother country. The trade of the United States with this island is not, however, very important, though an examination of the following table will show a perceptible increase in the amount of our tonnage, and but little variation in the value of our exports during the years which they embrace:

COMMERCE OF THE UNITED STATES WITH MALTA, FROM OCTOBER 1, 1832, TO JULY 1, 1856.

Years ending	Exports.			Imports.	Whereof there was in Bullion and Specie.		Tonnage Cleared.

No spirits or cordials, except rum and spirits, the product of Great Britain or of the British colonies, can be admitted for consumption, if they exceed 9 per cent. over-proof. The following are the legal rates for pilotage charged on all vessels entering the harbor of Malta:—Vessels of 100 tons burden, \$2; 101 to 150, \$3 04; 151 to 250, \$4; 251 to 350, \$5 04; 351 and upward, \$6.

Vessels discharging merchandise in the island of Malta, on clearing outward, pay for every ton, or any part thereof, including all port charges, 12 cents. There is a public hospital in Malta, to which British sailors are admitted free of charge. American and

other foreign sailors are also admitted at a charge of 20 cents per diem, the payment of which must be guaranteed by their respective consuls, or by the consignees of the vessels to which they belong.

For trade of, travel in, etc., Malta, see *Edin. Rev.*, vi., 194; *North Am. Rev.*, xxxv., 228 (A. H. EVERETT), x., 225 (E. EVERETT); *South. Lit. Mess.*, x., 728, ix., 86, 163, vii., 830, iv., 780, v., 146; *Chr. Exam.*, ii., 259 (JAS. WALKER); *Quar. Rev.*, ix., 1.

Man, Isle of, is, as every one knows, situated in the Irish Sea, at about an equal distance from England, Scotland, and Ireland. It is about 80 miles long, and 10 or 12 broad. The interior is mountain-

ous, and the soil nowhere very productive. Population in 1851, 52,387. This island used to be one of the principal stations of the herring fishery; but for a considerable period, it has been comparatively deserted by the herring shoals, a circumstance which is not to be regretted; for the fishery, by withdrawing the attention of the inhabitants from agriculture and manufactures, and leading them to engage in what has usually been a gambling and unproductive business, has been, on the whole, injurious to the island. The steam packets from Glasgow to Liverpool, and from the latter to Belfast, touch at the Isle of Man; which is, in consequence, largely frequented by visitors from these cities, and other parts of the empire, whose influx has materially contributed to the improvement of Douglas, the principal port in the island, and other towns. The feudal sovereignty of Man was formerly vested in the Earls of Derby, and more recently in the Dukes of Athol, a circumstance which accounts for the fact of the duties on most commodities consumed in the island having been, for a lengthened period, much lower than those on the same commodities when consumed in Great Britain. This distinction, which still subsists, has produced a great deal of smuggling, and been in no ordinary degree injurious to the revenue and trade of the empire. The customs revenue collected in the Isle of Man in 1852, amounted to £28,077; but from this sum £14,373 was deducted on account of expenses of collection, public works, internal government, etc.

Manchester, a city, parliamentary and municipal borough, and parish of England, county Lancaster. Area of parish, including the borough Salford, 33,553 acres. Population, 452,158. Inhabited houses, 53,697. Population in 1801, 110,938; in 1841, 353,390; in 1851, 401,321, of whom 316,213 were in the borough of Manchester, and 85,108 in that of Salford. The town stands on a plain, and consists, with Salford, of a dense mass of buildings, extending about two miles from east to west, by somewhat less from north to south, and covering about 3000 acres. It has a branch of the Bank of England, 5 joint-stock banks, and 5 weekly newspapers. Market, Tuesday, Thursday, and Saturday. The proximity of an abundance of coal, the improvements introduced into spinning and weaving machinery by Hughes, Arkwright, Hargreaves, and Crompton, and the application of steam power, have raised Manchester to its eminence of monopolizing two thirds of the cotton manufacture of Great Britain. Its manufactures are mostly conducted in large mills and factories. Of these in 1853, there were in Manchester and Salford:

	No. of works.	Persons employed.	Steam Power.
Cotton spinning.....	35	5,292	1,520
Cotton weaving.....	65	7,709	1,080
Cotton spinning and weaving....	42	17,358	4,706

Silk throwing and small ware....	50	7,520	580
Flax spinning.....	8	1,120	198
Print works.....	35	2,985
Total.....	233	42,264	8,185

Woolen fabrics, machinery, hats, paper, ropes, twine, pins, and numerous other goods, are made in large quantities; and there are many bleaching and chemical works, and breweries. Annual export valued at £12,000,000. Manchester communicates with Birmingham and London by the Grand Junction (N. W.) railroad, and by other railroads and canals with Liverpool, Bolton, Preston, Rochdale, Sheffield, etc.

Manganese (Ger. *Braunstein*, *Glasseise*; Du. *Bruinsteen*; Fr. *Manganèse*, *Magalèse*, *Savon du verre*; It. *Manganesia*; Sp. *Manganesia*; Lat. *Magnesia nigra*, *Manganesium*), a metal which, when pure, is of a grayish white color, like cast-iron, and has a good deal of brilliancy. Its texture is granular; it has neither

taste nor smell; it is softer than cast-iron, and may be filed; its specific gravity is 8. It is very brittle, and can neither be hammered nor drawn out into wire. Its tenacity is unknown. When exposed to the air, it attracts oxygen with considerable rapidity. It soon loses its lustre, and becomes gray, violet, brown, and at last black. These changes take place still more rapidly if the metal be heated in an open vessel. Ores of manganese are common in Devonshire, Somersetshire, etc. The ore of manganese, known in Derbyshire by the name of *black wadd*, is remarkable for its spontaneous inflammation with oil. Oxyd of manganese is of considerable use; it is employed in making oxy muriatic acid, for forming bleaching liquor. It is also used in glazing black earthenware, for giving colors to enamels, and in the manufacture of porcelain. It is the substance generally used by chemists for obtaining oxygen gas.—THOMSON'S *Chemistry*, etc.

Mangel Wurzel, or **Field Beet** (Fr. *Bette-raves*; Ger. *Mangold Wurzel*; It. *Biettoia*), a mongrel between the red and white beet. It has been largely cultivated in Europe and the United States, partly as food for cattle, and partly to be used in distillation, and in the extraction of sugar. Its culture in Great Britain is very recent; and Mr. Loudon questions whether it has any advantages over the turnip for general agricultural purposes. The preparation of the soil is exactly the same as for turnips, and immense crops are raised on strong clays. The produce per acre is about the same as that of the Swedish turnip; it is applied almost entirely to the fattening of stock, and the feeding of milch cows.—LOUDON'S *Ency. of Agr.*

Manger, the space near the hawse holes, bounded on the upper side by a partition across the bows, called the *manger board*, to receive the water while it enters the hawse holes and prevent it from flooding the deck.

Mangle (Fr. *Calandre*; Ger. *Mangle*), this is a well-known machine for smoothing table-cloths, table-napkins, as well as linen and cotton furniture, and much used in hotels. As usually made, it consists of an oblong rectangular wooden chest, filled with stones, which load it to a degree of pressure that it should exercise upon the two cylinders on which it rests, and which, by rolling backward and forward over the linen spread upon a polished table underneath, render it smooth and level. The moving wheel, being furnished with teeth upon both surfaces of its periphery, and having a notch cut out at one part, allows a pinion, uniformly driven in one direction, to act alternately upon its outside and inside, so as to cause the reciprocating motion of the chest. This elegant and much admired English invention, called the mangle-wheel, has been introduced with great advantage into the machinery of the textile manufactures.

Mango (*mangos marum*, in the Tamul language of India), is a very large fruit-tree, inhabiting the tropical parts of Asia, throughout all which it is as extensively cultivated as the apple and pear-trees are in Europe. Old specimens have been seen with a trunk from 10 to 15 feet in circumference. The fruit is something like a nectarine, but more compressed, longer, and more curved. It contains a large stone, covered with coarse fibres, which lose themselves in the succulent flesh. The wild and inferior varieties of the fruit taste so strongly of turpentine as to be wholly unfit for use by Europeans; but in the fine varieties this flavor is replaced by a rich sugary quality, which renders it very delicious. In this country the mango has rarely ripened its fruit, but it is common in the shops in a pickled state. The fruit of the *Mangifera Indica*, a tree cultivated in Asia, is also called *mango*.

Manifest, in commercial navigation, is a document signed by the master, containing the name or names of the places where the goods on board have been laden, and the place or places for which they are

respectively destined; the name and tonnage of the vessel, the name of the master, and the name of the place to which the vessel belongs; a particular account and description of all the packages on board, with the marks and numbers thereon, the goods contained in such packages, the names of the respective shippers and consignees, as far as such particulars are known to the master, etc. A separate manifest is required for tobacco. The manifest must be made out, dated, and signed by the captain, at the place or places where the goods, or any part of the goods, are taken on board.

Manilla, the capital of Luconia, the largest of the Philippine Islands, and the principal settlement of the Spaniards in the East, in lat. $14^{\circ} 36' 8''$ N., long. $120^{\circ} 53' 30''$ E. Population about 100,000, of whom from 4000 to 5000 may be Europeans. Manilla is built on the shore of a spacious bay of the same name, at the mouth of a river navigable for small vessels a considerable way into the interior. The smaller class of ships anchor in Manilla Roads, in 5 fathoms, the north bastion bearing N. 37° E., the fishery stakes at the river's mouth N. 18° E., distant about a mile; but large ships anchor at Cavita, about 3 leagues to the southward, where there is a good harbor, well sheltered from the west and south-west winds. The arsenal is at Cavita, which is defended by Fort St. Philip, the strongest fortress on the islands. The city is surrounded by a wall and towers, and some of the bastions are well furnished with artillery. Though situated within the tropics, the climate of the Philippines

is sufficiently temperate; the only considerable disadvantage under which they labor in this respect being that the principal part of the group comes within the range of the typhoons. The soil is of very different qualities; but for the most part singularly fertile. They are rich in mineral, vegetable, and animal productions. It is stated in a statistical account of the Philippines, published at Manilla in 1818 and 1819, that the entire population of the islands amounted to 2,249,852, of which 1,376,222 belonged to Luconia. There were at the period referred to only 2837 Europeans in the islands, and little more than 6000 Chinese. The natives are said to be the most active, bold, and energetic, of any belonging to the eastern Archipelago. "These people," says a most intelligent navigator, "appear in no respect inferior to those of Europe. They cultivate the earth like men of understanding; are carpenters, joiners, smiths, goldsmiths, weavers, masons, etc. I have walked through their villages, and found them kind, hospitable, and communicative; and though the Spaniards speak of and treat them with contempt, I perceived that the vices they attributed to the Indians, ought rather to be imputed to the government they have themselves established."—*Voyage de M. De la Perouse*, c. xv.

The principal articles of export consist of sugar, hemp, indigo, segars, cotton, coffee, rice, sapan-wood, mother-of-pearl, hides, ebony, gold dust, etc. The principal articles of import are stuffs for clothing, iron, hardware, furniture, fire-arms, and ammunition, etc.

ACCOUNT OF THE QUANTITIES AND DESTINATION OF THE PRODUCE EXPORTED FROM MANILLA IN 1850.

The quantity of rice and paddy shipped to China from the islands can not be ascertained with any degree of exactness; what goes from Manilla is very small, because, before arriving there, it has, by its transport expenses, added to the price at which it is obtainable in the districts where it is produced, which, of course, prevents its being shipped from the capital. Probably, however, about 1,000,000 coynas, each of which, one with another, weighs about a China pecul, or $13\frac{3}{4}$ lbs., may be annually exported. The export is regulated by the supposed scarcity or abundance of food in the country.—M'KIN'S *Manilla*, p. 270.

The principal currency of Manilla consists of Spanish dollars, of 8 reals and 96 grains; but South American dollars are also current. The weights in use are the Spanish pound, which is nearly 2 per cent. heavier than the English; the arroba = $25\frac{1}{2}$ English lbs. nearly; the quintal = 102 lbs., and the pecul of 5 arrobas, or $1\frac{1}{2}$ cwt. English. The coyan is a measure for rice, etc., varying from 96 to 185 lbs. According to a recent list, there are in Manilla 47 Spanish merchants and 11 foreign firms. The Spanish merchants have a chamber of commerce and a joint-stock insurance society. The United States, France, and Belgium have consuls, and each of the Canton marine insurance companies has an agent here. There are, however, neither fire nor life-offices nor agents; nor is any newspaper, price-

current, or other periodical publication issued in Manilla. Considering the great fertility and varied productions of the Philippines, and their peculiarly favorable situation for carrying on commerce, the limited extent of their trade, even with its late increase, may excite surprise. This, however, is entirely a consequence of the wretched policy of the Spanish government, which persevered until very recently in excluding all foreign ships from the ports of the Philippines, confining the trade between them and Mexico and South America to a single ship! Even ships and settlers from China were excluded. "Provisions," says La Perouse, "of all kinds are in the greatest abundance here, and extremely cheap; but clothing, European hardware, and furniture, bear an excessively high price. The want of competition, together with prohibitions and restraints of every kind laid on commerce, render the productions and merchandise of India and China at least as dear as in Europe!" Happily, however, this miserable policy the effects of which have been admirably depicted by M. De la Perouse, has been materially modified during the last few years. The events of the late war destroyed forever the old colonial system of Spain; and the ships of all nations are now freely admitted into Manilla and the other ports in the Philippines. An unprecedented stimulus has, in consequence been given to all sorts of

industry; and its progress will, no doubt, become more rapid, according as a wider experience and acquaintance with foreigners make the natives better aware of the advantages of commerce and industry, and disabuses them of the prejudices of which they have been so long the slaves.

Port Charges.—On foreign vessels, 2 reals per ton, and one half on such as neither load nor unload cargo, besides fees, amounting from \$5 to \$15, according to the size of the vessel.

Import Duties.—Spanish commodities by Spanish vessels, pay 3 per cent. ad valorem, and 8 by foreign. Foreign commodities, by foreign vessels, 14 per cent., and 7 by Spanish; in general, being 8 per cent. under national flag from Singapore, and 9 from China. Spirits and strong liquors, produce of Spain, by Spanish vessels, 10 per cent., and 25 for foreign; if they be foreign produce, by Spanish vessels, 30 per cent., and 60 by foreign. Cider and beer, produce of Spain, by Spanish vessels, 3 per cent., and 10 by foreign; if they be foreign produce, by Spanish vessels, 20, and 25 foreign. All Spanish wines, by national vessels, 3 per cent., and 8 by foreign. Foreign wines, by Spanish vessels, 40 per cent., and 60 by foreign, except champagne, which pays, by Spanish vessels, 7 per cent., and 14 by foreign. Cotton twist, gray, black, blue, and purple, knives or bolos, such as the natives use, ready-made clothes, boots, shoes, preserved fruits, confectionery, and vinegar, by Spanish vessels, 20 per cent., and 30 by foreign. British and other foreign cotton and silk manufactures, made in imitation of native cloths, chiefly stripes or checks, of black, blue, and purple colors. Madras and Bengal gray, white, and printed cottons, towels, table-napkins, and table-cloths, 15 per cent. by Spanish vessels, and 25 by foreign. Beche de mer, rattans, diamonds, tortoise-shell, mother-of-pearl-shell, and birds' nests, 1 per cent. by Spanish vessels, and 2 by foreign. Machinery of all sorts for the promotion of the industry of the country, cotton twist of red, rose, yellow, and green colors, gold and silver, coined or uncoined, plants and seeds, free. Tropical productions similar to those of the Philippines, also arrack and gunpowder, are prohibited. Opium is only admitted to be deposited for re-exportation. Swords, fowling-pieces, muskets, pistols, and warlike stores may be deposited for re-export, and can not be introduced without the special license of the government; but cannon and dress-swords are admitted.

Export Duties.—Commodities and produce of every description to Spain, by national vessels, pay 1 per cent., and 2 by foreign; elsewhere, $1\frac{1}{2}$ by Spanish vessels, and 3 by foreign. Hemp, by national vessels, to whatever destination, 1 per cent., and 2 by foreign. Rice, by Spanish vessels, free, and $4\frac{1}{2}$ per cent. by foreign. Manufactured tobacco, and cordage of Manilla hemp, free by all flags. Gold dust, gold in bars, and silver in bars, free.

Entrepôt Duties.—One per cent. ad valorem, and 1 per cent. at the exportation, with 1 per cent. more if the commodities should be kept there more than 12 months, two years being the longest time allowed for it.

Port and Custom-house Regulations.—Vessels newly arrived are not to communicate with the shore until having been visited by the port captain's boat; and within 30 hours after this visit, a manifest must be presented, stating packages, marks, and numbers; but the vessel may retain her cargo 10 days in transit without stating whether for consumption or deposit, and without being obliged to land, or incurring any charge on the same, except gunpowder, pocket-pistols, and forbidden arms.

Terms for Sales and Purchases.—Sales and purchases made, duty paid, at 3 to 5 months' credit, occasionally at $2\frac{1}{2}$ per cent. discount for prompt payment, and exports are bought for cash. See PHILIPPINE ISLANDS.

Manioc, is the Indian name of the nutritious matter of the shrub *Jatropha manihot*, from which *cassava* and *tapioca* are made in the West Indies.

Manna (Fr. *Manne*; Ger. *Mannaesche*; It. *Manna*), the concrete juice of the *Fraxinus ornus*, a species of ash growing in the south of Europe. The juice exudes spontaneously in warm dry weather, and concretes into whitish tears; but the greater part of the manna of commerce is obtained by making incisions in the tree, and gathering the juice in baskets, where it forms irregular masses of a reddish or brownish color, often full of impurities. Manna is imported in chests, principally from Sicily and Calabria. The best is in oblong pieces or flakes, moderately dry, friable, light, of a whitish or pale yellow color, and in some degree transparent: the inferior kinds are moist unctuous, and brown. It has a slight peculiar odor, and a sweet taste, with some degree of bitterness not very pleasant, and leaving a nauseous impression on the tongue.

Mantua-maker. The word is supposed by some, and we think rightly, to be a corruption from *manteau*, French. Others assert that a court-dress was early known in England by the name of Mantua, either on account of its having been invented at Mantua, or from the celebrated Manto, in honor of whom that famous city was built by her son, Bianor, or Ochnus, about 1000 B.C.—BUTLER.

Manufacture, a commodity produced from raw or natural materials, either by the work of the hand or by machinery.

Manufacturer, one who works up a natural product into an artificial commodity.

STATEMENT SHOWING THE ANNUAL MANUFACTURES OF THE MOST PROMINENT COUNTRIES IN THE WORLD.

<i>Austrian Empire.</i>	
Spindles	1,500,000
<i>Austrian Italy—Annual Produce.</i>	
Silk	7,000,000 lbs.
Registered manufactures	11,064
<i>British Empire, £122,150,000 estimate.</i>	
Cotton	£25,000,000
Woolen	24,000,000
Iron and hardware	20,000,000
Leather	18,500,000
Linen	8,000,000
Silk	10,000,000
Glass and earthenware	4,250,000
Hats	2,400,000
Paper	2,000,000
Watches, jewelries, etc.	8,000,000
<i>France, £23,200,000 estimate.</i>	
Raw silk	£12,000,000
Woolen	10,600,000
Linen	10,400,000
Cotton	9,000,000
Iron, brass, etc.	8,600,000
Refined sugar	4,480,000
Other kinds	88,120,000
<i>Prussia.</i>	
Number of manufacturing establishments in 1846	73,469
Machine spinning	2,608
Weaving	2,728
Connected with weaving	2,850
Mills	37,590
Metal	12,693
Other kinds	20,005
<i>Russian Empire.</i>	
Spindles at St. Petersburg in 1840	343,000
Producing 33½ hanks per day.	
Russian spindles	700,000
<i>United States.</i>	
Cotton manufactured a year	200,000,000 lbs.
Woolen manufactures	4,398,112

The States which produced 1,000,000 pounds and over of maple sugar in 1850 were as follows:

	Pounds.		Pounds.
New Hampshire..	1,298,863	Virginia.....	1,227,665
Vermont.....	6,849,257	Indiana.....	2,921,122
New York.....	10,367,484	Ohio.....	4,588,209
Pennsylvania.....	2,326,524	Michigan.....	2,489,794

The State of Louisiana produces four fifths of all the sugar crop of the Union, both maple and cane.

The production of maple depends very much upon the circumstances of the market. Its manufacture is not a regular business, like that of cane, but is prosecuted or not, very much to suit the convenience of the farming population among whom the sugar orchards lie. Nothing but a very high price of sugar—so high as to make its purchase a severe burden—stimulates a large production of maple. Accordingly we find that from 1850 to 1855 the product of maple sugar in New York State fell from 10,367,484 pounds to 4,935,815 pounds—a reduction of more than one half. If the falling off in price from 1850 to 1855 reduced the production one half, we are inclined to think it not extravagant to estimate that the present increased price has doubled the production of 1850, and we accordingly estimate the maple sugar crop of the present year in New York State at 20,000,000 pounds. It is worth not less than 12½ cents per pound, making its total value \$2,500,000!

Adopting the same estimate, would give the maple sugar crop of the whole Union for the present spring as 68,500,000 pounds, and its value as \$8,562,500—making the quantity and value very nearly equal to one half the cane product of last year—and contributing in a very important degree to relieve the last year's deficiency. See SUGAR.

Maple-tree (*acer saccharinum*) known as the rock maple, hard maple, bird's-eye maple, sugar maple. The *acer saccharinum* is one of the most noble and majestic of American trees. In favorable situations it sometimes grows to a height of 70 or 80 feet, and from 2 to 4 feet in diameter; but usually it does not exceed an elevation of 50 or 60 feet, and a diameter of 12 or 18 inches. The trunk is generally straight, though often studded with projections and excrescences. In all healthful and vigorous trees, the outward bark is light-colored, by which they may readily be distinguished. When growing in open situations, with room to spread on every side, where all its branches are exposed to the free action of light, this tree is an object of great beauty. It somewhat resembles the English oak, in its outline, in the form of its trunk, and disposition of its branches, and in the dense and massy character of its foliage.

The wood of the *acer saccharinum*, when newly cut, is white, but after being wrought and exposed for some time to the light, it takes a rosy tinge. Its grain is fine and close, and when polished its lustre is silky. It is very strong and heavy, but wants the property of durability, for which the English and American white oaks are so highly esteemed. The northern wood, when dry, weighs 46 pounds to a cubic foot, but that grown south weighs much less. When cut, and properly dried, it makes excellent fuel, which is equally esteemed by some, for that purpose, with the oak and hickory. When exposed to the alternations of moisture and dryness, it soon decays, and for this reason it is not much used in civil and naval architecture. In Maine, New Hampshire, Vermont, and further north, where the oak is not plentiful, the timber of this tree is substituted for it, in preference to that of the beech, the birch, or the elm. When perfectly seasoned, which requires two or three years, it is used for axles, trees, spokes, runners of common sleds, mill-cogs, and for chairs, and cabinet-work. It is also sometimes used for the frames of houses, keels, and the lower frames of vessels, piles, and foundation pieces for mills, canal locks, and for many other purposes where strength is required, and the work is not exposed to the alternation of moisture and dryness. The wood of this tree exhibits several accidental forms in the arrangement of its fibre, of which cabinet-makers take advantage in manufacturing beautiful articles of furniture, such as bedsteads, writing-desks, and other fancy works, and for inlaying mahogany and black walnut, in bureaux, piano-fortes, etc. These forms or varieties may be classified and described as follows:

1. **CURLED MAPLE.** *Erable gris ondulé*, French. The undulations or medullary rays of this variety, like those of the red-flowered maple, are lustrous, and in one light appear darker, and in another lighter than the rest of the wood. Sometimes the zig-zag lines are crossed by beautifully-colored veins; but, unfortunately, the lustre of these shades disappear by long exposure to light and air.

2. **BIRD'S-EYE MAPLE.** *Erable mouchète*, French. This variety exhibits small whitish spots or eyes, not exceeding a tenth of an inch in diameter, sometimes occurring a little way apart, and at others contiguously disposed. The more numerous these spots, the more beautiful and valuable the wood. They are seen only in old trees, which are still sound, and appear to arise from an infection of the fibres from the centres of their trunks toward the surface across the grain. To obtain the finest effect, the wood should be sawed

as nearly as possible in a direction parallel with the concentric circles.

In addition to the above-named varieties, two other kinds occur in the *wens*, or excrescences, which grow on the trunk or roots of this tree, and, like them, are covered with bark. The most valuable variety is known by the name of *Variiegated Maple-knob*, or *Loupe d'érable de couleurs variées*, of the French. It presents an assemblage of shades, agreeably disposed, sometimes resembling Arabic characters, which renders the wood very appropriate for fancy works, and from its scarcity it usually commands high prices. The other variety, known by the name of *Silver-white Maple-knob*, or *Loupe d'érable blanc argenté*, of the French, exhibits a silvery lustre by the arrangement of its fibres, and is highly prized for the same purposes as the preceding, although more common.

The wood of this species is easily distinguished from that of the red-flowered maple, which it resembles in appearance, by its weight and hardness. There is, besides, a very simple and certain test. A few drops of water saturated with copperas (sulphate of iron), being poured upon samples of different woods, that of the sugar maple turns greenish, and the white maple and the red-flowered maple change to a deep blue. The ashes of the sugar maple are rich in the alkaline principle, and it has been asserted that they furnish four fifths of the potash exported from the United States to Europe. In the forges of Maine, New Hampshire, Vermont, and places further north where this tree grows, its charcoal is preferred to that of any other wood; and it is said to be one fifth heavier than that made from the same species in the middle and southern States.

The extraction of sugar from this tree is a valuable resource in a new country where it abounds; but it is obvious that this mode of obtaining sugar is only destined for a certain stage in the progress of society, and eventually gives way to the sugar of commerce, produced by cane. For this reason we shall not detail the process of its manufacture, as it can not be regarded as a matter of practical utility. In a country like the United States, intersected by canals, railroads, and other channels of inter-communication, where labor is expensive, and fuel is becoming more and more valuable, the manufacture of this article can not fail to be an unprofitable occupation. Besides, the annual draught of the sap renders the trees sickly, and causes a premature decay.

From the great height, extended branches, regular and often pyramidal form, and the rich verdure and cleanliness of the foliage in spring and summer, the sugar maple is accounted as one of our finest shade-trees, and is highly recommended to be planted along streets and avenues, in pastures, and ornamental grounds. And it is no less beautiful in our forest or woodland scenery in autumn, when it puts on its bright-orange and deep-crimson robes. At first, the extremities of the boughs alone change their color, leaving the internal and more sheltered parts still in their verdure, which "gives to the tree the effect of great depth of shade, and displays advantageously the light, lively coloring of the sprays." Later in the season, on the contrary, when the tints become more and more gorgeous, and the full beams of the sunshine fall upon the large masses of foliage, the warm and glowing colors of the whole summit possess a great deal of grandeur, and add much to the beauty and effect in the landscape.

The wood of the *acer eriocarpum*, or white maple, is very white when newly cut, and of a fine texture; but it is softer and lighter than that of any other maple in the United States; and from the want of strength and durability it is little used. When dry, it weighs 38 pounds to a cubic foot, and in seasoning, loses nearly half of its weight. It is sometimes used in cabinet-making, instead of the holly or other light-colored

wood, for inlaying furniture of mahogany, cherry-tree, and black walnut; though it is less suitable for this purpose, as it soon changes color by exposure to light. Wooden bowls are also made of it, when that of ash, or tulip-tree can not be obtained. The charcoal of this wood is preferred by hatters and dyers to every other, as it affords a heat more uniform, and of longer duration. The sap is in motion earlier in this species than in the sugar maple, beginning to ascend, in the middle States, about the 15th of January; so that when it is employed for making sugar, the operations are sooner completed. Like the sap of the red-flowered maple, it yields not more than one half of the product of sugar, from a given measure, as that of the *acer saccharinum*. Its inner bark produces a black precipitate with copperas (sulphate of iron), and is sometimes employed in domestic dyeing.

The wood of the *acer rubrum*, or red maple, when dry, weighs 44 pounds to a cubic foot, and when green, it is soft, full of aqueous matter, and loses in drying nearly one half of its weight. In this tree, as in others which grow in wet places, the sap-wood bears a large proportion to the heart-wood, the latter of which consists of an irregular column, star-like in its transverse section, and occupies the central parts of large trunks, with its points projecting into the sap-wood. This wood has but little strength, is liable to injury from insects, and ferments, and speedily decays when exposed to the alternation of moisture and dryness. Yet it is solid, and for many purposes is preferred by workmen to other kinds of wood. It is harder than that of the white maple, and of a finer and closer grain; hence it is easily wrought in the lathe, and acquires, by polishing, a glossy and silky surface. It is principally employed in the manufacture of chairs, saddle-trees, shoe-lasts, ox-yokes, broom-handles, and various other articles of domestic use. It sometimes happens that, in very old trees, the grain of the wood, instead of following a perpendicular direction, is undulated; and this variety bears the name of *curled maple*. This singular arrangement is never found in young trees, nor even in the branches of such as exhibit it in the trunk; it is also less conspicuous in the centre of the tree than near the bark. Trees offering this disposition, however, are rare. The serpentine direction of the fibres, which renders this wood difficult to split and to work, produces, in the hands of a skillful mechanic, the most beautiful effects of light and shade. These effects are rendered more striking, if, after smoothing the surface of the wood with a double-ironed plane, it is rubbed with a little sulphuric acid, and afterward with linseed oil. On examining it attentively, the varying shades are found to be owing entirely to the inflection of the rays of light; which is more sensibly perceived in viewing it in different directions by candle-light. Before mahogany became generally fashionable in the United States, the best furniture in use was made of the red-flowered maple, and bedsteads are still made of it, which in richness of lustre exceed those of the finest imported woods. But one of the most constant uses to which the curled maple is applied is for the stocks of rifles and fowling-pieces, which, to elegance and lightness, unite toughness and strength, the result of the tortuous direction of the fibres. The cellular matter of the inner bark is of a dusky-red. By boiling, it yields a purplish colored liquor, which, with the addition of sulphate of iron (copperas), acquires an intense dark blue, or black; and is sometimes employed as ink by American youth in village schools. For this purpose, however, it is very inappropriate, as it never dries properly, and in damp weather the writing becomes glutinous, and blots. A fluid prepared in a similar manner, by adding sulphate of alumina (common alum), instead of copperas, is also used for dyeing black. The French Canadians make sugar from the sap of this maple, which they call *plaine*; but, as in the

preceding species, the product of a given measure is not more than one half as great as that of the sugar maple.

The *acer campestre*, or field maple, is found throughout the middle States of Europe, and in the north of Asia. According to Pallas, it abounds in New Russia, and about Caucasus. It is common in hedges and thickets in the middle counties and south of England; but in the northern counties, and in Scotland, it is rare. It is not indigenous to Ireland, and perhaps not to Scotland. The wood of the *acer campestre*, when allowed to become a tree, and of a proper age, is very compact, possesses a fine grain, sometimes beautifully veined, and is susceptible of a high polish. When dry, it weighs 52 pounds to a cubic foot. It makes excellent fuel, and produces charcoal of the best quality, which is sometimes employed in the manufacture of gunpowder. It was celebrated among the ancient Romans for tables; and Pliny, who has treated at length upon the *brusca* and *mollusca*, the names under which the knobs and excrescences of this tree were known, informs us that cabinet-work of the most costly description was fabricated from them. In France and other European countries, it is still extensively used by turners, carvers, and cabinet-makers, and the wood of the roots, which is often knotted and curiously marbled, is wrought into snuff-boxes, pipes, and various other articles of fancy.—BROWNE'S *Trees of America*.

Maps and Charts. They were invented by Anaximander, the Milesian philosopher, a disciple of Thales, and the earliest philosophical astronomer on record, 570 B. C. He was also the first who constructed spheres. A celestial chart was, it is said, constructed in China in the 6th century.—*Freret*. And sea-charts were first brought to England by Bartholomew Columbus, to illustrate his brother's theory respecting a western continent, A. D. 1489. The earliest map of England was drawn by George Lily in 1520. Mercator's chart, in which the world was taken as a plane, was invented in 1566. A map of the moon's surface was first drawn at Dantzic in 1647.—HAYDN.

Of the Construction and Use of Maps.—In representing the geographical divisions of the earth's surface, two objects are to be kept in view; on the one hand to exhibit accurately to the eye the relative position of the different countries, and, on the other hand, to give a delineation sufficiently minute to furnish a distinct knowledge of the necessary details. As a globe has very nearly the exact figure of the earth, the representation which it affords of the surface fulfills the first of these objects in the most perfect manner; but to attain the second it would be requisite to enlarge the globe beyond all convenient size. A globe of the ordinary dimensions serves almost no other purpose in this respect but to convey a clear conception of the earth's surface as a whole; exhibiting the figure, extent, position, and general features of the great continents and islands, with the intervening oceans and seas. To obtain a detailed representation of any part of the earth's surface, geographers have therefore found it necessary to have recourse to maps, in which countries are delineated on a plane, while the mutual proportions of the distance of places are preserved as nearly as possible the same as on the globe.

For the construction of maps different mathematical hypotheses have been adopted. By one method of construction, that of *projection*, the boundaries of countries, and their more remarkable features, are represented according to the rules of perspective, on the supposition of the eye being placed on some point of the sphere, or at some given distance from it, which may be increased indefinitely. Wherever the eye is supposed to be situated, the representation thus obtained answers very well, provided the surface to be represented is of small extent, and the point of view, or *projecting point*, is nearly over the centre; but when the surface is of great extent, for example, a

whole hemisphere, those places which are situated near the border of the projection are in all of them much distorted. Another method, that of *development*, is founded on the supposition that the spherical surface to be represented is a portion of a cone, of which the vertex is situated somewhere in the polar axis produced, and the conical surface is supposed either to touch the sphere in the middle parallel of the map, or to fall within the sphere of the middle parallel, and without it at the extreme parallels. The surface of the cone is then supposed to be spread out into a plane. For the "History and Construction of Maps," see *Eccl. Rev.*, xxv., 365; same article in *Living Age*, xxi., 353; *Smithsonian Annual Report*, 1856-7.

A third method, which depends on the development of a cylindrical surface, is that according to which maps are so delineated as to have the parallels of latitude and circles of longitude respectively represented by parallel straight lines. By this method marine charts are constructed. As the rhumb makes equal angles with every meridian, it necessarily, according to this method of delineation, becomes a straight line. Such a representation of the earth's surface is commonly called *Mercator's Chart*, although the invention is due to an English mathematician, Edward Wright. These are the three principal methods employed to represent to the eye the several countries on the surface of the earth. See CHARTS and COAST SURVEY.

The maps and charts of our country and the coasts, besides being of great general interest, are of such importance to the commercial community that any account of the progress made in this direction, should be made known as matter of common interest. The United States' Coast Survey have completed the surveys of a large portion of our coast, and, with a view of obtaining the important facts relative to the old surveys of the country, have employed Mr. J. G. Kohl to investigate the earliest records extant of the history of our maps and charts. Mr. Kohl has extended his researches, and in a series of lectures before the Smithsonian Institute (and published in their last Report), has embodied a general history of the origin of the cartographical art, and from these lectures we make some extracts that have an especial relation to the early history of our own country: The Cartographical Art originated probably everywhere with travelers by land and sea and their requirements; all the maps which we see mentioned in ancient times were probably more or less of this kind; as, for instance, those which the Greeks received from the Phenicians, and which they improved upon; so, too, the maps of the Romans, who scarcely mention any other than travelers' maps, called "*itineraria picta*" (painted itineraries), of which a separate class was formed by the "*itineraria maritima*" (marine itineraries).

By far the greater part of the maps painted during the middle ages belonged to this class, and more especially to the class of marine maps; because the greatest map-makers of that time, the Venetians and other Italians, were also the greatest navigators. Thus we see that the art of map-making particularly flourished among the great trading and navigating nations—the Phenicians, Greeks, and Italians. The different classes of cartographical works for which they had names in the middle ages related all of them more or less exclusively to the hydrography of the sea. Very common, for instance, were the so-called "*portulanos*," or indicators of harbors. The "*isolarios*" (books of islands) form a very curious sort of composition, also probably designed for the special use of mariners. In these insularies the authors represented and described all the most important islands of the world, which they separated from their surrounding continents. From the class of maps, made by conquerors and distributors of land, have grown our official government surveys, which often are very

valuable, because they are made without a too great fear of expense. They generally contain the most important information as regards the political divisions of the country, and for the adjustment of boundary questions. Sometimes, being particularly destined for government use, they have not been given to the public, or at least not to any great extent. With respect to America we have many most important publications of this character made by the French and British governments for Canada, by the British Admiralty for nearly every part of America; by the Spanish hydrographical dépôt in Madrid, for Spanish America, and by the Land Office, Topographical Bureau, Coast Survey Office, and other branches of the United States' government, for different parts of the territory of the United States. The governments of Brazil, of New Granada, and other South American States, have likewise caused splendid publications to be made, descriptive of the territories under their dominion.

Until the time of Columbus and Gama, nations had no accurate knowledge of the world, except that of their own immediate neighborhood. Hence, for thousands of years, the art of constructing maps made but little progress. The maps that were in use at the time of Columbus were not much better than those made for the work of Ptolemy a thousand years before. They do not include a greater extent of country, they exhibit no new facts, nor do they show any greater accuracy in the location of points on the earth's surface. After the discovery of America and the countries bordering on the Pacific Ocean and the Indian Sea, the extent of the known and habitable world was much increased, and the figure of the continents and the limits of the oceans were more correctly given on the maps. But it was still very long ere the classes of interesting facts represented on the maps were enlarged, and the manner of depicting them improved.

Water remained for a long time a blank on all the old maps. It was not known that the ocean offers so much variety in color, depth, temperature, and fitness for motion as the dry land itself. The Spaniards knew that some parts of the ocean are rough and boisterous, and called a certain part "el Golfo de los Cabellos" (the Horse Gulf), and a quiet portion "el Golfo de las Damas" (the Ladies' Gulf). Some of the regular currents of the ocean were also of early discovery. The Gulf Stream was known as early as 1512, or since the first voyage of Ponce de Leon to Florida. We find on many maps, in the neighborhood of Florida, legends like the following: "Here the water runs continually to the north." It would have been easier to have designated this by a few strips of color; and yet it required the inventive genius of Franklin, for it was he who first located definitely the Gulf Stream in our maps.

The regular trade winds between India and Arabia, with their nature, direction, and changes, were not only known, but daily taken advantage of by navigators for centuries. So too the trade winds of the Atlantic were described, discussed, and used, at least since the time of Columbus. Nevertheless, though there are currents that flow with nearly the same regularity as rivers, no map-maker gave any visible hint respecting them to the navigator to whom he pretended to furnish useful charts, until the time of our modern Rennell's Wind-maps, which are also a very late innovation of our century.

The existence of the banks of Newfoundland was known to the very first discoverers of the eastern coast of North America. Nay, for a long time these banks were the most frequented part of the North American waters, being visited since the year 1504 by whole fleets of French, Portuguese, Spanish, and English fishermen. To have a true conception of their configuration, extent, varying depths, currents, and

other circumstances, was almost of greater importance for all the navigating nations of Europe than to know the configuration of the coasts of the great continent itself. Yet at a time when the whole east coast of North America was already very well represented on the maps, we see the Georges Bank, Nantucket shoals, and the other great banks, before this coast, either not given at all, or else in a shape so little like reality that it would have been almost better to leave them out altogether. The other qualities of the bottom of the ocean, its deep valleys and lofty mountain ranges, were of course not noticed in an age which did not possess our deep-sea sounding instruments, and which had also no practical occasion for such explorations. This practical interest has existed only since the question has been mooted where we can lay with safety our electric wires for the connection of the two continents. For this purpose we now explore those hidden recesses, and we may expect that ere long our pictures of the oceans will present as great variety of scenes as do those of the dry land itself.

We should endeavor to collect and preserve all the old records and charts of our early maritime history. These are valuable to science, and are objects of curiosity and interest to our merchants, and it should be the object of the Chamber of Commerce to collect and preserve these records of the past.

Maranhão, or Maranhão, a province of Brazil, in South America. This name, which is common to the province, the capital, the island on which it stands, the River Meary, and the Amazon, is derived from Marañon, the appellation which the navigator Pinzan first bestowed upon the estuary of the Amazon, upon finding that its waters did not possess the saline properties of the ocean. It lies between $1^{\circ} 20'$ and $10^{\circ} 50'$ of south latitude, and $45^{\circ} 10'$ and $53^{\circ} 20'$ of west longitude, being nearly 400 miles in length from north to south, and having an average breadth of about 200 miles. Maranhão, or St. Luiz, the capital, is situated on an island of the same name of about 42 miles in circumference. It forms the south-east side of the Bay of Marcos, having to the eastward the Bay of San José, in latitude $2^{\circ} 32'$ south, and longitude $43^{\circ} 40'$ west. It is fertile, and well inhabited, there being, besides the capital, numerous small hamlets belonging to the natives. Much difficulty is experienced in reaching this island, on account of the rapidity of three rivers at the mouth of which it is situated. The harbor, which is formed by a narrow creek, is of a sufficient depth to admit of merchantmen entering; but it is so beset with shoals as to require a pilot, and its depth is diminishing. Population about 30,000. Chief public edifices, an episcopal palace, college, hospital, theatre, and numerous convents of the Franciscan and Carmelite orders. It is the residence of the governor, and has a lyceum and schools of navigation and commerce. Chief exports, cotton, rice, and sarsaparilla. Chief imports, slaves. The average number of slaves imported between the years 1840 and 1845 averaged 5000 annually, for whom a considerable duty was derived. With regard to exports and imports, there are no returns which can be relied on later than the year 1820. From 1815 to 1820, the average number of bags of cotton exported was 68,000. The exports of rice varied during these years from 56,000 to 82,000 bags. The other articles sent out of the country consisted of hides, tanned and untanned, skins, and gums. The entire population of the province amounted, in 1821, to 182,000. This province might be made one of great importance, for it possesses vast capabilities; but as yet it is in an infant or semi-barbarous state.

Marble (Ger., *Rus.*, and Lat. *Marmo*; Du. *Marmmer*; Fr. *Marbre*; It. *Marmo*; Sp. *Marmol*), a genus of fossils, composed chiefly of lime; being a bright and beautiful stone, moderately hard, not giving fire with steel, fermenting with and soluble in acid menstrua, and calcining in a slight fire. *Dipænus* and *Seyllis*,

statuaries of Crete, were the first artists who sculptured marble, and polished their works; all statues previously to their time being of wood, 568 B.C.—*Pliny*. Marble afterward came into use for statues and the columns and ornaments of fine buildings; and the edifices and monuments of Rome were constructed of, or ornamented with, fine marble. The ruins of Palmyra prove that its magnificent structures, which were chiefly of white marble, were far more extensive and splendid than those of even Rome itself. These latter were discovered by some English travelers near Aleppo, A. D. 1678.

The colors by which marbles are distinguished are almost innumerable. Some are quite black, others, again, are of a snowy white; some are greenish, others grayish, reddish, bluish, yellowish, etc.; while some are variegated and spotted with many different colors and shades of colors. The finest solid modern marbles are those of Italy, Blankenburg, France, Flanders and the United States.

Italy produces a most valuable marble, and its exportation makes a considerable branch of her foreign commerce. The black and the milk-white marble of Carara, in the duchy of Massa, are particularly esteemed. The marble of Germany, Norway, and Sweden are very inferior, being mixed with a sort of scaly limestone. Marble is of so hard, and compact, and fine a texture as readily to take a beautiful polish. That most esteemed by statuaries is brought from the island of Paros, in the Archipelago. It was employed by Praxiteles and Phidias, both of whom were natives of that island; whence also the famous Arundelian marbles were brought. The marble of Carara is likewise in high repute among sculptors. The specific gravity of marble is from 2.700 to 2.800. Black marble owes its color to a slight mixture of iron.

Brande divides marble, according to their localities, into classes, each of which contains eight subdivisions: 1. Uni-colored marbles, including only the white and the black; 2. Variegated marbles; those with irregular spots or veins. 3. Madreporic marbles, presenting animal remains in the shape of white or gray spots, with irregularly disposed dots or stars in the centre. 4. Shell marbles; with only a few shells interspersed in the calcareous base. 5. Lunachella marbles, entirely composed of shells. 6. Cipolin marbles, con-

taining veins of greenish talc. 7. Breccia marbles, formed of a number of angular fragments of different marbles, united by a common cement. 8. Pudding-stone marbles; a conglomerate of round pieces.

Of Cutting and Polishing Marble.—The marble saw is a thin plate of soft iron, continually supplied during its sawing motion, with water and the sharpest sand. The sawing of moderate pieces is performed by hand, but that of large slabs is most economically done by a proper mill.

The first substance used in the polishing process is the sharpest sand, which must be worked with till the surface becomes perfectly flat. Then a second, and even a third sand of increasing fineness is to be applied. The next substance is emery of progressive degrees of fineness, after which tripoli is employed; and the last polish is given with tin-putty. The body with which the sand is rubbed upon the marble, is usually a plate of iron; but for the subsequent process, a plate of lead is used with fine sand and emery. The polishing-rubbers are coarse linen cloths or bagging, wedged tight into an iron planing tool. In every step of the operation, a constant trickling supply of water is required.

Marbling, the method of preparing and coloring marbled paper. There are several kinds of marbled paper, but the principal difference between them consists in the forms in which the colors are laid on the ground; some being disposed in whirls or circumvolutions, others in jagged lengths, and others only in spots of a rounder oval figure. The general manner of managing each kind is, nevertheless, the same, namely, the dipping the paper in a solution of gum-tragacanth, or, as it is commonly called, gum-dragon, over which the colors, previously prepared with ox-gall and spirit of wine, are first spread.

Marine, a general name for the navy of a kingdom or state, as also for the whole economy of naval affairs, or whatever respects the building, rigging, arming, equipping, navigating, and fighting of ships. It comprehends, likewise, the government of naval armaments, and the state of all the persons employed therein, whether civil or military.

Marines, or Marine Forces, a body of soldiers raised for the naval service, and trained to fight either in a naval engagement or in an action on shore.

Mariner's Compass. The Chinese ascribe the invention of the compass to their Emperor Hong-Ti, who, they say, was a grandson of Noah; and some of their historians refer the invention of it to a later date, 1115 B.C. The honor of its discovery, though much disputed, is generally given to Flavio de Gioja or Giovia, a native of Amalfi, an ancient commercial city of Naples, A.D. 1302. The variation of the needle was first discovered by Columbus in his voyages of discovery, 1492; and it was observed in London in 1580. The dipping-needle was invented by Robert Norman, a compass-maker of Ratcliffe in that year. See COMPASS; *Am. Jour. Sc.*, xl., 242.

Maritime Law. By maritime law is meant the law relating to harbors, ships, and seamen. It forms an important branch of the commercial law of all maritime nations. It is divided into a variety of different departments; such as those with respect to harbors, the property of ships, the duties and rights of masters and seamen, contracts of affreightment, average, salvage, etc. The reader will find those subjects treated of under their respective heads.

Sketch of the Progress of Maritime Law.—The earliest system of maritime law was supplied by the Rhodians, several centuries before the Christian era. The most celebrated authors of antiquity have spoken in high terms of the wisdom of the Rhodian laws; luckily, however, we are not wholly left, in forming our opinion upon them, to the vague, commendatory statements of Cicero and Strabo. (CICERO *pro Lege Manilia*; STRAB., lib. xiv.) The laws of Rhodes

were adopted by Augustus into the legislation of Rome; and such was the estimation in which they were held, that the Emperor Antoninus, being solicited to decide a contested point with respect to shipping, is reported to have answered, that it ought to be decided by the Rhodian laws, which were of paramount authority in such cases, unless they happened to be directly at variance with some regulation of the Roman law.— (“*Ego quidem mundi dominus, lex autem maris legis id Rhodia, qua de rebus nauticis præscripta est, judicetur, quatenus nulla nostrarum legum adversatur. Hoc idem Divus quoque Augustus judicavit.*”) The rule of the Rhodian law with respect to average contributions in the event of a sacrifice being made at sea for the safety of the ship and cargo, is expressly laid down in the Digest (lib. xiv.); and the most probable conclusion seems to be, that most of the regulations as to maritime affairs, embodied in the compilations of Justinian have been derived from the same source. The regulations as to average adopted by all modern nations, are borrowed, with hardly any alteration, from the Roman, or rather, as we have seen, from the Rhodian law!—a conclusive proof of the sagacity of those by whom they had been originally framed. The only authentic fragments of the Rhodian law are those in the Digest. The collection entitled *Jus navale Rhodiorum*, published at Bâle in 1561, is now admitted by all critics to be spurious. See *ante*, pp. 1168–1192.

The first modern code of maritime law is said to have been compiled at Amalfi, in Italy, a city at present in ruins; but which, besides being early distinguished for its commerce, will be forever famous for the discovery of the Pandects, and the supposed invention of the mariner's compass. The Amalfitan code is said to have been denominated *Tabula Amalfitana*. But if such a body of law really existed, it is singular that it should never have been published, nor even any extracts from it. M. Pardessus has shown that all the authors who have referred to the Amalfitan code and asserted its existence, have copied the statement of Freccia, in his book *De Subfeudis*. (*Collection des Loix Maritimes*.) And as Freccia assures us that the Amalfitan code continued to be followed in Naples at the time when he wrote (1570), it is difficult to suppose that it could have entirely disappeared; and it seems most probable, as nothing peculiar to it has ever transpired, that it consisted principally of the regulations laid down in the Roman law, which, it is known, preserved their ascendancy for a longer period in the south of Italy than any where else.

But, besides Amalfi, Venice, Marseilles, Pisa, Genoa, Barcelona, Valencia, and other towns of the Mediterranean, were early distinguished for the extent to which they carried commerce and navigation. In the absence of any positive information on the subject, it seems reasonable to suppose that their maritime laws would be principally borrowed from those of Rome, but with such alterations and modifications as might be deemed requisite to accommodate them to the particular views of each state. But whether in this or in some other way, it is certain that various conflicting regulations were established, which led to much confusion and uncertainty; and the experience of the inconveniences thence arising, doubtless contributed to the universal adoption of the *Consolato del Mare* as a code of maritime law. Nothing certain is known as to the origin of this code. Azuni (*Droit Maritime de l'Europe*, tome i., or rather Jotto, *Codice Ferdinando*, from whose work a large portion of Azuni's is literally translated) contends, in a very able dissertation, that the Pisans are entitled to the glory of having compiled the whole, or at least the greater part, of the *Consolato del Mare*. On the other hand, Don Antonio de Capmany, in his learned and excellent work on the commerce of Barcelona (*Antiguo Comercio de Barcelona*, tome i., pp. 170–183), has endeavored to show that the

Consolato was compiled at Barcelona; and that it contains the rules according to which the consuls, which the Barcelonese had established in foreign places so early as 1268, were to render their decisions. It is certain that the *Consolato* was printed for the first time at Barcelona, in 1502; and that the early Italian and French editions are translations from the Catalan. Azuni has, indeed, sufficiently proved that the Pisans had a code of maritime laws at a very early period, and that several of the regulations in it are substantially the same as those in the *Consolato*. But it does not appear that the Barcelonese were aware of the regulations of the Pisans, or that the resemblance between them and those in the *Consolato* is more than accidental; or may not fairly be ascribed to the concurrence that can hardly fail to obtain among well-informed persons legislating upon the same topics, and influenced by principles and practices derived from the civil law.

M. Pardessus, in the second volume of his excellent work already referred to, appears to have been sufficiently disposed, had there been any grounds to go upon, to set up a claim in favor of Marseilles to the honor of being the birth-place of the *Consolato*; but he candidly admits that such a pretension could not be supported, and unwillingly adheres to Capmany's opinion. “*Quoique Français,*” says he, “*quoique portée par des sentimens de reconnaissance, qu'aucun événement ne sauroit affaiblir, à faire valoir tout ce qui est en faveur de Marseilles, je dois reconnoître franchement que les probabilités l'emportent en faveur de Barcelone.*” —Tome ii. But to whichever city the honor of compiling the *Consolato* may be due, there can be no doubt that its antiquity has been greatly exaggerated. It is affirmed, in a preface to the different editions, that it was solemnly accepted, subscribed and promulgated, as a body of maritime law, by the Holy See in 1075, and by the kings of France and other potentates at different periods between 1075 and 1270. But Capmany, Azuni, and Pardessus, have shown in the clearest and most satisfactory manner that the circumstances alluded to in this sketch could not possibly have taken place, and that it is wholly unworthy of attention. The most probable opinion seems to be, that it was compiled, and began to be introduced about the end of the 13th or beginning of the 14th century. And notwithstanding its prolixity, and the want of precision and clearness, the correspondence of the greater number of its rules with the ascertained principles of justice and public utility, gradually led, without the intervention of any agreement, to its adoption as a system of maritime jurisprudence by all the nations contiguous to the Mediterranean. It is still of high authority. Casaregis says of it, though perhaps, too strongly, “*Consulatus maris, in materiis maritimiis, tanquam universalis consuetudo habens vim legis, inviolabiliter attendenda est apud omnes provincias et nationes.*”—Disc. 214.

The collection of sea laws next in celebrity, but anterior, perhaps, in point of time, is that denominated the *Roole des Jugemens d'Oleron*. There is as much diversity of opinion as to the origin of these laws, as there is with respect to the origin of the *Consolato*. The prevailing opinion in Great Britain has been, that they were compiled by direction of Queen Eleanor, wife of Henry II., in her quality of Duchess of Guienne; and that they were afterward enlarged and improved by her son Richard I., at his return from the Holy Land; but this statement is now admitted to rest on no good foundation. The most probable theory seems to be, that they are a collection of the rules or practices followed at the principal French ports on the Atlantic, as Bordeaux, Rochelle, St. Malo, etc. They contain, indeed, rules that are essential to all maritime transactions, wherever they may be carried on; but the references in the code sufficiently prove that it is of French origin. The circumstance of that

monarch's having large possessions in France at the period when the Rules of Oleron were collected, naturally facilitated their introduction into England; and they have long enjoyed a very high degree of authority in that country. "I call them the laws of Oleron," said a great civilian (*Sir Leoline Jenkins, Charge to the Cinque Ports*), "not but that they are peculiarly enough English, being long since incorporated into the customs and statutes of our admiralties; but the equity of them is so great, and the use and reason of them so general, that they are known and received all the world over by that, rather than by any other name." Molloy, however, has more correctly, perhaps, said of the laws of Oleron, that "they never obtained any other or greater force than those of Rhodes formerly did; that is, they were esteemed for the reason and equity found in them, and applied to the case emergent."—*De Jure Maritimo et Navali*.

A code of maritime law issued by Wisby, in the island of Gothland, in the Baltic, has long enjoyed a high reputation in the north. The date of its compilation is uncertain; but it is comparatively modern. It is true that some of the northern jurists contend that the laws of Wisby are older than the Rules of Oleron, and that the latter are chiefly copied from the former! But it has been repeatedly shown that there is not so much as the shadow of a foundation for this statement. See PARDESSUS, *Collection, etc.*, tome i., pp. 425, 462; *Foreign Quarterly Review*, No. 13, art. *Hanseatic League*. The laws of Wisby are not certainly older than the latter part of the 14th or beginning of the 15th century; and have obviously been compiled from the *Consolato del Mare*, the Rules of Oleron, and other codes that were then in use. Grotius has spoken of these laws in the most laudatory manner:—"Que de maritimis negotiis," says he, "*insula Gothlandia habitatoribus placuerunt, tantum in se habent, tum equitatis, tum prudentiæ, ut omnes oceanî accola eo, non tanquam proprio, sed velut gentium jure, utantur.*"—*Prolegomena ad Procopium*, p. 64.

Besides the codes now mentioned, the ordinances of the Hanse Towns, issued in 1597 and 1614, contain a system of laws relating to navigation that is of great authority. The judgments of Damme, the customs of Amsterdam, etc., are also often quoted. A translation of the law of Oleron, Wisby, and the Hanse Towns, is given in the 3d edition of Malynes's *Lex Mercatoria*, but the edition of them in the work of M. Pardessus, referred to in the text, is infinitely superior to every other. But by far the most complete and well-digested system of maritime jurisprudence that has ever appeared, is that comprised in the famous *Ordonnance de la Marine* issued by Louis XIV., in 1681. This excellent code was compiled under the direction of M. Colbert, by individuals of great talent and learning, after a careful revision of all the ancient sea laws of France and other countries, and upon consultation with the different parliaments, the courts of admiralty, and the chambers of commerce, of the different towns. It combines whatever experience and the wisdom of ages had shown to be best in the Roman laws, and in the institutions of the modern maritime states of Europe. In the preface to his treatise on the *Law of Shipping*, Lord Tenterden says:—"If the reader should be offended at the frequent references to this ordinance, I must request him to recollect that those references are made to the maritime code of a great commercial nation, which has contributed much of its national prosperity to that code: a code composed in the reign of a politic prince; under the auspices of a wise and enlightened minister; by laborious and learned persons, who selected the most valuable principles of all the maritime laws then existing; and which, in matter, method, and style, is one of the most finished acts of legislation that ever was promulgated." The ordinance of 1681 was published in 1760, with a detailed and most elaborate commentary by M. Valin, in 2 vol-

umes, 4to. It is impossible which to admire most in this commentary, the learning or the sound good sense of the writer. Lord Mansfield was indebted for no inconsiderable portion of his superior knowledge of the principles of maritime jurisprudence to a careful study of M. Valin's work.

That part of the *Code de Commerce* which treats of maritime affairs, insurance, etc., is copied with very little alteration, from the ordinance of 1681. The few changes that have been made are not always improvements. No system or code of maritime law has ever been issued by authority in Great Britain. The laws and practices that now obtain among them, in reference to maritime affairs have been founded principally on the practices of merchants, the principles laid down in the civil law, the laws of Oleron and Wisby, the works of distinguished juriconsults, the judicial decisions of their own and foreign countries, etc. A law so constructed has necessarily been in a progressive state of improvement; and, though still susceptible of amendment, it corresponds, at this moment, more nearly, perhaps, than any other system of maritime law, with those universally recognized principles of justice and general convenience by which the transactions of merchants and navigators ought to be regulated. The decisions of Lord Mansfield did much to fix the principles, and to improve and perfect the maritime law of England. It is also under great obligations to Lord Stowell. The decisions of the latter chiefly, indeed, respect questions of neutrality, growing out of the conflicting pretensions of belligerents and neutrals during the late war; but the principles and doctrines which he unfolds in treating those questions, throw a strong and steady light on those branches of maritime law. It has occasionally, indeed, been alleged—and the allegation is probably, in some degree well founded—that his lordship has conceded too much to the claims of belligerents. Still, however, his judgments must be regarded, allowing for this excusable bias, as among the noblest monuments of judicial wisdom of which any country can boast. "They will be contemplated," says Mr. Serjeant Marshall, "with applause and veneration, as long as depth of learning, soundness of argument, enlightened wisdom, and the chaste beauties of eloquence, hold any place in the estimation of mankind."—*On Insurance*, Prelim. Disc. The *Treatise of the Law Relative to Merchant Ships and Seamen*, by the late Chief Justice of the Court of King's Bench, does credit to the talents, erudition, and liberality of its noble and learned author. It gives, within a brief compass, a clear and admirable exposition of the most important branches of our maritime law; and may be consulted with equal facility and advantage by the merchant, the general scholar, and the lawyer. Mr. Serjeant Marshall has entered very fully into some, and has touched upon most points of maritime law, in his work on *Insurance*; and has discussed them with great learning and sagacity. The works of Mr. Justice Park, Mr. Holt, and a few others, are also valuable. Of the earlier treatises, the *Lex Mercatoria* of Malynes is by far the best; and, considering the period of its publication (1622), is a very extraordinary performance. See *North Am. Rev.*, vi., 323 (J. STORY), ii., 218, xiii., 1 (H. WHEATON); *Hunt's Mag.*, xiii., 232, 455, x., 337, ix., 261, 358, 543, xiv., 547, xv., 75, xxiv., 191.

The marine law of the United States is the same as the marine law of Europe. It is not the law of a particular country, but the general law of nations; and Lord Mansfield applied to its universal adoption the expressive language of Cicero, when speaking of the eternal laws of justice: "Nec erit alia lex Romæ, alia Athenis; alia nunc, alia posthac; sed et omnes gentes, et omni tempore una lex et sempiterna, et immortalis continebit."

In treating of this law, we refer to its pacific character as the law of commerce and navigation in time of peace. The respective rights of belligerents and neu-

trials in time of war constitute the code of prize law, and that forms a distinct law of inquiry. When Lord Mansfield mentioned the law-merchant as being a branch of public law, it was because that law did not rest essentially for its character and authority on the positive institutions and local customs of any particular country, but consisted of certain principles of equity, and usages of trade, which general commerce and a common sense of justice had established to regulate the dealings of merchants and mariners in all the commercial countries of the civilized world.

In the study and cultivation of maritime law our improvement has been rapid, and our career illustrious, since the adoption of the present Constitution of the United States. The decisions in federal courts, in commercial cases, have done credit to the intellectual and moral character of the nation, and the admiralty courts in particular have displayed great research and a familiar knowledge of the principles of the marine law of Europe.

The reports of judicial decisions in the several States, and especially in the States of Massachusetts, New York, and Pennsylvania, evince great attention to maritime questions; and they contain abundant proofs that our courts have been dealing largely with that business of our enterprising and commercial people.

Declaration respecting Maritime Law signed by the Plenipotentiaries of Great Britain, Austria, France, Prussia, Russia, Sardinia, and Turkey, assembled in Congress at Paris, April 16, 1856:

The plenipotentiaries who signed the Treaty of Paris, on the 30th of March, 1856, assembled in conference, considering: That maritime law in time of war has long been the subject of deplorable disputes; that the uncertainty of the law and of the duties in such a matter gives rise to differences of opinion between neutrals and belligerents which may occasion serious difficulties, and even conflicts; that it is, consequently, advantageous to establish a uniform doctrine on so important a point; that the plenipotentiaries assembled in Congress at Paris can not better respond to the intentions by which their governments are animated, than by seeking to introduce into international relations fixed principles in this respect. The above-mentioned plenipotentiaries, being duly authorized, resolved to concert among themselves as to the means of attaining this object; and having come to an agreement, have adopted the following solemn declarations:

1. Privateering is, and remains, abolished. 2. The neutral flag covers enemies' goods, with the exception of contraband of war. 3. The neutral goods, with the exception of contraband of war, are not liable to capture under enemy's flag. 4. Blockades, in order to be binding, must be effective; that is to say, maintained by a force sufficient really to prevent access to the coast by the enemy.

The governments of the undersigned plenipotentiaries engage to bring the present declaration to the knowledge of the States which have not taken part in the Congress of Paris, and invite them to accede to it. Convinced that the maxims which they now proclaim can not but be received with gratitude by the whole world, the undersigned plenipotentiaries doubt not that the efforts of their governments to obtain the general adoption thereof will be crowned with full success. The present declaration is not, and shall not be binding, except between those powers who have acceded or shall accede to it.

Done at Paris the 16th of April, 1856.

(Signed,)

The United States' Executive, through the Department of State, communicated to the French government its reply in August 1856, viz.:

These four points are *indivisible*, because he can not accept the first point—the abolition of privateering. Governor Marcy respectfully proposes, however, two distinct amendments:

1. Either to add to the *first* proposition in the "declaration" of the Congress of Paris—

"And that the private property of the subjects or citizens of a belligerent on the high seas shall be exempted from seizure by public armed vessels of the other belligerents, except it be contraband," or

2d. To adopt the 2d, 3d, and 4th propositions, without the first.

The argument contained in the reply of Governor Marcy is historical, argumentative, and forcible.

It goes to say, that no nation has a right to prescribe to another what shall constitute her military or naval force; and that we can, consistently with our institutions and policy, neither agree not to employ volunteers on land, nor privateers on the high seas. When a nation having a large standing army is threatening a nation with a small standing army, the latter must have recourse to volunteers; and so when a nation with a large navy, makes war on another with an inferior navy, the latter must have recourse to privateers, otherwise the nation with a large navy could employ a portion of her navy to keep the inferior navy of her enemy in check, and with the rest sweep the commerce of the latter from the ocean. Parity of position could only be reached if the armed cruisers of the superior navy and other national ships of war would forego making captures of the enemy's property on the high seas, or if the nation with an inferior navy armed privateers to inflict as much damage on the commerce of the greater naval power as the latter does on its inferior enemy. The concluding portion of Mr. Marcy's reply is as follows:

"In discussing the effect of the proposed measure—the abolition of privateering—a reference to the existing condition of nations is almost unavoidable. An instance will at once present itself in regard to two nations where the commerce of each is about equal, and about equally wide-spread over the world. As commercial powers they approach to an equality, but as naval powers there is great disparity between them. The regular navy of one vastly exceeds that of the other. In case of war between them only an inconsiderable part of the navy of the one would be required to prevent that of the other from being used for defense or aggression, while the remainder would be devoted to the unembarrassed employment of destroying the commerce of the weaker in naval strength. The fatal consequence of this great inequality of naval force between two such belligerents would be in part remedied by the use of privateers; in that case, while either might assail the commerce of the other in every sea, they would be obliged to distribute and employ their respective navies in the work of protection. This statement only illustrates what would be the case, with some modification, in every war where there may be considerable disparity in the naval strength of the belligerents.

"History throws much light upon the question. France, at an early period, was without a navy; and in her wars with Great Britain and Spain, both naval powers, she resorted, with signal good effect, to privateering, not only for protection, but successful aggression. She obtained many privateers from Holland, and by this force gained decided advantages on the ocean over her enemy. While in that condition France could hardly have been expected to originate or concur in a proposition to abolish privateering. The condition of many of the smaller States of the world is now, in relation to naval powers, not much unlike that of France in the middle of the 16th century.

At a later period, during the reign of Louis XIV., several expeditions were fitted out by him, composed wholly of privateers, which were most effectively employed in prosecuting hostilities with naval powers. Those who may have at any time a control on the ocean will be strongly tempted to regulate its use in a manner to subserve their own interests and ambitious projects. The ocean is the common property of all nations; and instead of yielding to a measure which will be likely to secure to a few—possibly to one—an ascendancy over it, each should pertinaciously retain all the means it possesses to defend the common heritage. A predominant power upon the ocean is more menacing to the well being of others than such a power on land; and all are alike interested in resisting a measure calculated to facilitate the permanent establishment of such a domination, whether to be wielded by one power or shared among a few others. The injuries likely to result from surrendering the dominion of the seas to one or a few nations which have powerful navies, arise mainly from the practice of subjecting private property on the ocean to seizure by belligerents. Justice and humanity demand this practice should be abandoned, and that the rules in relation to such property on land should be extended to it when found upon the high seas.

"The President, therefore, proposes to add to the first proposition in the 'Declaration' of the Congress at Paris the following words: 'And that the private property of the subjects or citizens of the belligerent on the high seas shall be exempted from seizure by public armed vessels of the other belligerent, except it be contraband.' Thus amended, the government of the United States will adopt it, together with the other three principles contained in that 'Declaration.' I am directed to communicate the approval of the President to the second, third, and fourth propositions, independently of the first, should the amendment be unacceptable. The amendment is recommended by so many powerful considerations, and the principle which calls for it has so long had the emphatic sanction of all enlightened nations in military operations on land, that the President is reluctant to believe it will meet with any serious opposition. Without the proposed modification of the first principle, he can not convince himself that it would be wise or safe to change the existing law in regard to the right of privateering.

"If the amendment should not be adopted, it will be proper for the United States to have some understanding in regard to the treatment of their privateers when they shall have occasion to visit the ports of those powers which are or may become parties to the declaration to the Congress at Paris. The United States will, upon the ground of right and comity, claim for them the same consideration to which they are entitled, and which was extended to them under the law of nations, before the attempted modification of it by that Congress.

"As connected with the subject herein discussed, it is not inappropriate to remark that a due regard to the fair claims of the neutrals would seem to require some modification, if not an abandonment, of the doctrine in relation to contraband trade. Nations which preserve the relations of peace should not be injuriously affected in their commercial intercourse by those which choose to involve themselves in war, provided the citizens of such peaceful nations do not compromise their character as neutrals by direct interference with the military operations of the belligerents. The laws of siege and blockade, it is believed, afford all the remedies against neutrals that the parties to war can justly claim. These laws interdict all trade with the besieged or blockaded places. A further interference with the ordinary pursuits of neutrals, in nowise to blame for an existing state of hostilities, is contrary to the obvious dictates of justice. If this view of the

subject could be adopted, and practically observed by all civilized nations, the right of search, which has been the source of so much annoyance, and of so many injuries to neutral commerce, would be restricted to such cases only as justified a suspicion of an attempt to trade with places actually in a state of siege or blockade.

"Humanity and justice demand that the calamities incident to war should be strictly limited to the belligerents themselves, and to those who voluntarily take part with them; but neutrals, abstaining in good faith from such complicity, ought to be left to pursue their ordinary trade with either belligerent without restrictions in respect to the articles entering into it.

"Though the United States do not propose to embarrass the other pending negotiations relative to the rights of neutrals, by pressing this change in the law of contraband, they will be ready to give it their sanction whenever there is a prospect of its favorable reception by other maritime powers.

"The undersigned avails himself of this opportunity to renew to the Count de Sartiges the assurance of his high consideration.

"W. L. MARCY."

The points here settled are all of them important. Privateering has been the scourge of the ocean—a lawless sort of warfare between belligerents themselves—a grievous annoyance and damage to neutrals, and a most prolific school of piracy. Those whose recollection extends back 30 or 40 years remember when the ocean was traversed by pirates, trained for their fiendish business by the long wars of the earlier years of the century. The best men of modern Christendom had never ceased to protest against the system. Sweden and Holland attempted, in the 17th century, to put an end to the practice, but without effect. The United States and Prussia, in 1785, entered into stipulations against privateering, as between themselves, but did not renew the provision. The French Legislature, in 1792, made a similar, but fruitless effort. Privateering was destined to have one license more for perpetrating its atrocities, and shocking the sense of mankind. Jurists lamented the practice, but were forced to acknowledge it a part of the law of nations, and gave up in despair all expectation of an early abandonment of the legalized outrage.

When the late war between the United States and Mexico occurred, it was matter of general gratulation that the circumstances of the case saved the world from the curse of privateering; and much more did the world rejoice; at the commencement of the late European war, when England and France announced their intention to grant no letters of marque. With the conclusion of that war—as part of the conclusion, indeed—we have the solemn compact of the great powers of Europe, that "privateering is, and remains, abolished." It is an important step in the progress of humanity.

The declaration that "the neutral flag covers enemies' goods, with the exception of contraband of war," diminishes greatly the liabilities of the world to future strifes. Until the breaking out of the recent war, Great Britain had steadily maintained the contrary doctrine as the law of nations. The Empress of Russia, in 1780, set forth precisely the doctrine of the late Paris Conference, and gained the concurrence of most of the States of Europe, and of the government of the United States. Great Britain refused to yield, and the other nations, one after another, submitted to the interpretations of that power. Even Russia herself conceded that point, and in 1801 agreed, by treaty, that an enemy's property was not protected in neutral ships. Jurists, our own with the rest, regarded the question of international law as settled on the British interpretation. The qualified accession of England, in the Declaration of 1854, to the principles of the Armed

Neutrality occasioned, therefore, general and gratifying surprise. It then entered the minds of none, however, that within two years she would make her full accession to those principles, by a compact with those very powers against whom, on this same question, she had leveled the broadsides of her fleets. In regard to this particular, Russia is the victorious party, and her triumph is a note of human progress. Turkey, too, has a proud distinction in this declaration, for in settling the point that free ships make free goods, she is but publishing anew what she was the first to declare 250 years ago. The labors of our own government have been in the same direction through the whole period of our national history. Our government, while admitting the English rule as to the law of nations, has declared that the rule had no foundation in natural right, and in repeated treaties has gained the insertion of the doctrine now proclaimed in Paris.

The third item in the late Declaration has been less the occasion of differences than the second. The fourth is a conclusive testimony against "paper blockades."

Whether our government will "accede" in form to the points named may be doubted, though every one of them is a concession to principles or usages for which we have contended, and all, it may be hoped, will have our uniform and hearty practical concurrence. It has been generally the policy of our statesmen to keep our government clear from alliances which might, under any circumstances, be embarrassing, and that disposition may demand for us, even in this instance, an attitude of independence. However this may be, the moral sense of the nation will accept with thankfulness the results of the Paris Conference, and the Christian will see new foretokenings of that day when nations shall learn war no more.

Maritime Loans. The contracts of *bottomry* and *respondentia* are maritime loans of a very high and privileged nature, and they are always upheld by the admiralty with a strong hand, when entered into *bonâ fide*, and without any suspicion of fraud. The principle on which they are founded and supported is of great antiquity, and penetrates so deeply into it, that Emerigon says its origin can not be traced. It was borrowed by the Romans from the ancient Rhodians, and it is deeply rooted in the maritime general law of Europe, from which it has been transplanted into the law of this country. The object of hypothecation bonds is to procure the necessary supplies for ships which happen to be in distress in foreign ports, where the master and owners are without credit, and in cases in which, if assistance could not be procured by means of such instruments, the vessels and cargoes must be left to perish. The authority of the master to hypothecate the ship and freight, and even the cargo, in a case of necessity, is indisputable. The vital principle of a bottomry bond is, that it be taken in a case of unprovided necessity when the owner has no resources or credit for obtaining necessary supplies. If the lender knew that the owner had an empowered consignee or agent in the port, willing to supply his wants, the taking the loan is a fraud; but if fairly taken under an ignorance of the fact, the courts of admiralty are disposed to uphold such bonds, as necessary for the support of commerce in its extremities of distress. And if the lender of money on a bottomry or respondentia bond be willing to stake the money upon the safe arrival of the ship or cargo, and to take upon himself, like an insurer, the risk of sea perils, it is lawful, reasonable, and just, that he should be authorized to demand and receive an extraordinary interest, to be agreed upon, and which the lender shall deem commensurate to the hazard he runs.

A *bottomry bond* is a loan of money upon the ship or ship and accruing freight, at an extraordinary interest, upon maritime risks, to be borne by the lender for a specific voyage, or for a definite period. It is in

the nature of a mortgage, by which the ship-owner, or the master on his behalf, pledges the ship as a security for the money borrowed, and it covers the freight of the voyage, or during a limited time. A *respondentia* bond is a loan upon the pledge of the cargo, though an hypothecation of both ship and cargo may be made in one bond; and it amounts at most to an equitable lien on the salvage in case of loss. The condition of the loan is the safe arrival of the subject hypothecated, and the entire principle as well as interest is at the risk of the lender during the voyage. The bottomry holder undertakes the risk of the voyage as to the enumerated perils, but not as to those which arise from the fault or misconduct of the master or owner. The money is loaned to the borrower, upon condition that if the subject pledged be lost by a peril of the sea, the lender shall not be repaid, except to the extent of what remains, and if the subject arrives safe, or if it shall not have been injured, except by its own defect, or the fault of the master or mariners, the borrower must return the sum borrowed, together with the maritime interest agreed upon, and for the repayment the person of the borrower is bound, as well as the property pledged. This is the definition of the contract given by Pothier, and it was taken from the Roman laws, and has been adopted by Emerigon, and he says the definition is given in nearly the same terms by all the maritime jurists.—KENT'S *Com.*

Mark, or Marc, a weight used in several parts of Europe, for various commodities, especially gold and silver. In France, the mark was divided into 8 ozs. = 61 drachms = 192 deniers or pennyweights = 4,608 grains. In Holland, the mark weight was also called Troy weight, and was equal to that of France. When gold and silver are sold by the mark, it is divided into 24 carats.

The pound, or *livre poids de marc*, the weight most commonly used in retail dealings throughout France, previous to the Revolution, was equal to 2 marcs, and consequently contained 16 ozs. = 182 drachms = 884 den. = 9,216 grains. One kilogramme is nearly equal to 2 livres. Subjoined is a table of livres, *poids de marc*, from 1 to 10, converted into kilogrammes. Any greater number may be learned by a simple multiplication and addition.

Livres.	Kilog.	Livres.	Kilog.
1 =	0.4895	5 =	2.9370
2 =	0.9790	7 =	3.4265
3 =	1.4685	8 =	3.9160
4 =	1.9580	9 =	4.4055
5 =	2.4475	10 =	4.8951

Mark, is a term sometimes used for a money of account, and in some countries for a coin. The English mark is $\frac{3}{4}$ ds of a pound sterling, or 13s. 4d.; and the Scotch mark is $\frac{2}{3}$ ds of a pound Scotch. The mark Lubs, or Lubec mark, used at Hamburg, is a money of account, equal to 29 $\frac{1}{2}$ cents. See HAMBURG.

Market, a public place in a city or town, where provisions are sold. No market is to be kept within 7 miles of the city of London; but all butchers, victualers, etc., may hire stalls and standings in the flesh-markets there, and sell meat and other provisions. Every person who has a market is entitled to receive toll for the things sold in it; and by ancient custom, for things standing in the market, though not sold; but those who keep a market in any other manner than it is granted, or extort tolls or fees where none are due, forfeit the same. See FAIRS.

Marseilles, a large commercial city and sea-port of France, on the Mediterranean, lat. 48° 17' 49" N., long. 5° 22 $\frac{1}{2}$ ' E. Population, 1851, including suburbs, 195,257. The harbor, the access to which is defended by several strong fortifications, is in the centre of the city, forming a basis 525 fathoms in length, by about 152 fathoms in breadth. The tide is hardly sensible; but the depth of water at the entrance to the harbor varies from 16 to 18 feet, being lowest when the wind is north-west, and highest when it is

south-west. Within the basin, the depth of water varies from 12 to 24 feet, being shallowest on the north, and deepest on the south side. Dredging machines are constantly at work to clear out the mud, and to prevent the harbor from filling up. Though not accessible to the largest class of ships, Marseilles is one of the best and safest ports in the world for moderate-sized merchantmen, of which it will accommodate above 1000. Ships in the basin lie close alongside the quays; and there is every facility for getting them speedily loaded and unloaded. The Isles de Rattonneau and Pomegues, and the strongly fortified islet or rock of If, lie W.S.W. from the port; the latter, which is the nearest to it, being only $1\frac{1}{2}$ miles distant, and not more than $\frac{1}{2}$ of a mile from the projecting point of land to the south of the city. There is good anchorage ground for men-of-war and other large ships between the Isles de Rattonneau and Pomegues, to the west of the Isle d'If. When coming from the south, it is usual to make the Isle de Blanier, in lat. $43^{\circ} 11' 54''$ N., long. $5^{\circ} 13' 59''$ E. A light-house erected on this island is 131 feet high; the flashes of the light, which is a revolving one, succeed each other every half minute, and in clear weather it may be seen 7 leagues off. Ships that have made the Isle de Blanier, or that of Le Maire, lying east from it about $4\frac{1}{2}$ miles, steer northerly for the Isle d'If, distant about 7 miles from each, and having got within $\frac{1}{2}$ or $\frac{1}{4}$ a mile of it, heave to for a pilot, who carries them into a harbor; it is not, however, obligatory on ships to take a pilot on board; but being obliged to pay for one whether they avail themselves of his services or not, they seldom dispense with them. The charge is 4 sous per ton in, and 2 sous per ton out, for French vessels, and the vessels having reciprocity treaties with France. There is a light-house in the fort St. Jean, on the north side of the entrance of the port. The lazaretto, which is one of the best in Europe, lies a little to the north of the city; and there is an hospital on Rattonneau Island, for individuals whose health is dubious. With the exception of the above charge for pilotage, and the charges for such vessels as perform quarantine, there are no port charges on ships entering at or clearing out from Marseilles.

Usages.—As soon as the master has, on his arrival, made his declaration at the Health Office, and received *pratique*, he is directed to an office close by, called the Patache, where he makes two similar declarations, the one for the captain of the port, and the other for the custom-house; the day and hour of the latter being made is marked, in order to ascertain if the regular manifest of his cargo is delivered at the custom-house within 24 hours after, as required by law. As soon as these declarations are made, the master is accosted by one or more public brokers, who alone are authorized by law to enter ships at the custom-house and other public offices, and to interpret, if it be necessary, for the master. The broker whom he may select then gives the master all the necessary information respecting the usages of the port as regards the ship and cargo, and goes through all the formalities respecting them that the law or local regulations require. Independent of the regular manifest which it is usual in all ports for the master to give in to the custom-house, he is here required to give in a full and complete list of all the ship's stores, provisions, etc., that he has on board for his own use, and that of his crew; and he can not be too careful to make this list as correct as possible, as when it is subsequently verified on board by the custom-house and excise officers, any variation subjects the ship to penalties. This is particularly the case with tobacco, which, being a government monopoly, is watched with the greatest vigilance. All the tobacco on board over that which the crew have in their chests for their own use, must be declared, and any attempt at concealment or smuggling is visited with heavy fines. When the ship

sails, the stores, provisions, etc., are again examined, and an excise duty charged on such provisions and other excisable articles as may have been consumed in the port. No fire or light is allowed on board, and the cooking is all done on shore. Marseilles is a city of great antiquity, and has long enjoyed a very extensive commerce. Havre, partly, no doubt, from its being, as it were, the port of Paris, used to enjoy a greater share of the trade of France; but, notwithstanding the increased importance of the former, it has recently been surpassed by Marseilles. The customs duties collected at Havre in 1851, were 26,164,000 francs, whereas those collected at Marseilles during the same year amounted to 30,677,000 francs; having increased to that amount from 25,899,000 francs in 1830.

This statement shows conclusively, that the trade of Marseilles is not only increasing, but that it is already very extensive. She is the grand emporium of the south of France, and the centre of 9-10ths of her commerce with the countries on the Mediterranean and Black Sea. The exports consist principally of silk stuffs, wines, brandies, and liquors; woollens and linens; madder, oil, soap, refined sugar, perfumery, stationery, verdigris, and all sorts of colonial products. Among the principal imports are sugar, coffee, and other colonial products; dye stuffs; corn from the Black Sea and the north coast of Africa; cotton from Egypt and America; coal, linen, thread, and various descriptions of manufactured goods from England; with hides, wool, tallow, timber, etc. Marseilles engrosses almost the whole trade between France and Algiers. She is now also the principal seat of the intercourse carried on by steamers with Malta, Alexandria, and Constantinople; and besides the steamers employed by the government as packets, she ran upward of 28 steamers belonging to private companies. Mr. Maclaren says that in 1839 most of the latter had English-made engines, and English engineers; and that they burnt English coal, which sold here for about 30s. a ton. There belonged to the port, on the 31st of December, 1851, 684 sailing vessels of the burden of 63,577 tons; and 43 steamers of the burden of 9,505 tons. A joint-stock bank established here in 1835 is said to have been exceedingly successful.

ACCOUNT OF THE SHIPPING WHICH ARRIVED AT AND DEPARTED FROM MARSEILLES IN 1847, SPECIFYING THE COUNTRIES TO WHICH THE SHIPS BELONGED, AND THE NUMBER, TONNAGE, AND CREWS OF THOSE BELONGING TO EACH.

The arrivals and departures in this and the preceding year are considerably above the average, a consequence of the great importations of foreign corn. In

1846 the imports of wheat amounted to 1,290,000 quarters, and in 1847 to above 2,200,000 quarters.

We are unable to lay before the reader any very recent account of the import and export trade of Marseilles. We believe, however, that the value of the first was, in 1853, estimated at about 200,000,000 francs, and that of the exports at about as much. For information as to money, weights, measures, duties, etc., the reader is referred to FRANCE and HAVRE, under which heads he will find an account of the trade of France.

The trade of Marseilles has been much increased by the occupation of Algiers, she being the grand centre of the intercourse carried on with that country. But independently of this circumstance, Marseilles engrosses by far the largest share of the extensive commerce carried on between France and the east coast of Spain, Italy, Greece, and the Levant. See FRANCE.

Martinico, or Martinique, one of the French West India Islands, in the windward group, between lat. $14^{\circ} 24'$ and $14^{\circ} 53' N.$, and long. $60^{\circ} 50'$ and $61^{\circ} 18' W.$ Population, 1850, 121,145. It is mountainous, and contains several extinct volcanoes; the numerous small rivers are used to turn sugar-mills. About one quarter of the surface is covered with dense forests. Soil fertile, but only one fifth of the superficies is cultivated. Chief products, sugar, coffee, and cacao. This island, called by the natives Madiana, was discovered by the Spaniards in 1493. The French founded a colony on it in 1635. It was taken by the English in 1762, but resigned in 1763; they again occupied it from 1794 to 1809, and it was finally given up to France in 1814. The capital of the colony is Port Royal, but St. Pierre is the most populous town and the centre of commerce. The island is nearly 50 miles in length by about 16 in breadth, and comprehends an area of 360 square miles. The surface is uneven, and intersected in all parts by steep and rugged rocks. Piton de Corbet, one of the highest, is about 812 feet above the level of the sea. The shape of this calcareous hill resembles a cone, and it is on that account very difficult of access. The palm-trees with which it is covered, become more lofty and abundant near the summit, and these continually attract the clouds, which occasion noxious damps, and contribute to render it more rugged in appearance, and more dangerous to ascend. There are also two other mountains conspicuous from their elevation, and from these, particularly from the first, descend numerous streams, which irrigate the island. Martinique is better supplied with water, and less exposed to hurricanes than Guadeloupe, while the productions are nearly the same. Of 75,321 hectares, the superficial area of the island, 17,622 are employed in raising sugar-cane, 3861 in coffee, 719 in cocoa, 491 in cotton, 17,191 are pasturage, and 19,997 are woods. The annual production is valued at 21,000,000 francs. In 1824 the island consumed French products to the value of 16,000,000 francs, and exported to the mother country goods to the amount of 18,000,000 francs. The tonnage engaged in this commerce amounted to 33,500 tons. The revenue in 1823, was 4,000,000 francs. The commerce of Martinique has continued nearly the same since the period at which the above estimate was made.

Port Royal, the capital and seat of the courts of justice of Martinique, is situated on one of the several bays which indent the island, and possess one of the safest and most capacious harbors in the West Indies, or even in the world.

The commercial relations of Martinique and Guadeloupe are regulated by the royal decree of February 5, 1826, and by such other decrees as have subsequently been promulgated. Foreign and national ships may import into all open ports of the islands (in Martinique, the ports of St. Pierre, Port Royal, and Trinité; in Guadeloupe, Moule, La Basseterre, and

Poin-a-Pitre; and in Mariegalante, or Grandbourg, the principal town and only port of the island), articles of merchandise enumerated in the following tariff:

TARIFF FOR ALL FLAGS, NATIONAL AND FOREIGN.		
Denomination of merch.	No., weight or measure.	Rate of duty.
Animals, living.....	10 per ct. ad val.	
Beef, salt.....	100 kilos.=220 lbs. \$2 80	4-5
Codfish & other salt fish.....	" " 1 30	1-5
Indian corn, in grain.....	1 hect.=2 4-5 bush. 37	1-5
Vegetables, dried.....	" " 64	4-5
Rice.....	220 lbs. 1 80	1-5
Salt.....	" " 33	
Tobacco.....	7 per ct. ad val.	
Hoop-poles.....	1,000 \$1 86	
Wine, foreign.....	1 hect.=26 gals. In for ships, 93 c.	
		In nat. " 43-5c.
Stone coal.....	220 lbs. \$0 02	

By decree of March 10, 1855, salted provisions (meats) of every description pay only 50 centimes (9-3 cents) per 100 kilogrammes. Wood of all sorts, other than hoop-poles; tar, pitch, and other extracts of pine, etc.; hides, with the hair on; forage, green and dry; table fruits, and seeds, pay 4 per cent. ad valorem.

No. 2.—Free of Duty.—Ammonia, unpulverized; animal substances used in medicine and perfumery; bones and horns of animals; cassia; cochineal; cocoa-shells; copper; elephants' teeth; fats, except of fish; ginger; gloves; gums; indigo; Jesuits' bark; kermes; lac; lead; medicinal balsams, juices, roots, barks, herbs, leaves, and flowers; mother-of-pearl; nutmegs; peltries; pepper; potash; quercitron; rocou; rushes and reeds; seeds hard to be crushed; skins, dry and undressed; sumach; tin, unwrought; tortoise-shell, turmeric; vanilla; vegetables, green; wax, not worked; whale fins; woods, odoriferous, dye, and cabinet. Foreign vessels importing the above enumerated merchandise are subjected to no other port charges, light-house and tonnage duties, than are levied on French vessels. All goods not enumerated in the above tariff, and imported from foreign countries, either in foreign or French bottoms, are liable to confiscation.

The articles enumerated in lists Nos. 1 and 2, as well as all articles imported from France, may be re-exported, duty free, from one colony to another, but only in French vessels; on condition, however, that the importer of merchandise contained in list No. 1 proves that the duties have been discharged in the colony of original importation. Foreign vessels, as well as French, may export, duty free, to foreign countries, articles imported into the two colonies, whether from France or elsewhere; but these exportations can only be allowed from the ports opened by the ordinance of February 5, 1826, for the importation of merchandise enumerated in lists 1 and 2. Foreign flour may be imported (if necessity or urgency authorizes the importation) for a fixed duty of \$3 94.2 per 80 kilogrammes, or 177½ lbs.; but then it can only be done if a special order by the governor permitting the importation has been issued, which allowance will never extend beyond the term of three months.

Maryland, one of the central United States, lies between 38° and $39^{\circ} 44' N.$ lat., and between $75^{\circ} 10'$ and $79^{\circ} 21' W.$ long. It is 196 miles long and 120 broad, containing 11,000 square miles. Population in 1790, 319,728; in 1800, 345,824; in 1810, 380,546; in 1820, 407,350; in 1830, 446,913; in 1840, 469,282; and in 1850, 563,035.

Early History of Maryland.—In the year 1632 King Charles I. gave a charter to Cecilius Calvert, Lord Baltimore, and granted to him a tract of land lying in that peninsula, between the ocean and Chesapeake Bay, and round the northern extremities of that same bay, and ordered this land to be called "Maryland," in honor to the Queen Henrietta Maria, the consort of Charles I. She was of the Catholic religion, like Lord Baltimore himself, and likewise the greater part of the settlers which he carried out. The name appears for the first time in the charter of Maryland of the 20th

June, 1632. It is possible that Lord Baltimore and his associates, in proposing to the king that name, had also at the same time the old Spanish maps of North America before their eyes, on which Chesapeake Bay is called "St. Mary's Bay" (*Bahia de Santa Maria*) and that they had a desire to carry back to this bay that old and historical name. It may be a mere accident that the name Maria was as well in modern as in ancient times applied to the same regions. But what we call accident in history is often secretly linked together by an association of ideas which escapes our research.

Others think that the Calverts and their associates, and their Catholic missionaries, who explored and settled the territory of Maryland, thought, in giving this name, exclusively of the Queen Henrietta Maria and not at all of the Holy Virgin. It was among Spaniards and French, and among all Catholic colonists and discoverers, very customary to vow a new country or place, to which they gave a name in honor of some person, at the same time to the protection of that saint which bore the same name. They would, for instance, call a place named after Christopher Columbus, not "Christophoro," but "St. Christophoro," because they thought at once as well of the man as of his protecting saint. That something similar was going on at the baptism of Maryland seems not unlikely, from the circumstance that the first principal settlement of Maryland was called *St. Mary*, and that this settlement, as well as the surrounding country, is so called to this day. The fact that the old forgotten name *Mary*, in later times, returned to the same regions, appears one of the so-called "curious coincidences in history worthy to be pointed out."—J. G. KOHL.

Physical Features, etc.—Eastern Maryland, or that part of the State east of the Chesapeake Bay, is mostly level. The country on the west shore to the head of the tides is similar to the eastern shore; the soil of this portion is generally fertile, producing wheat, Indian corn, tobacco, etc. Above the tides the surface rises into hills, and the western part attains an elevated region, being crossed by the Alleghany Mountains. The western part contains much fine land, adapted both to grain and grazing. Extensive beds of coal and iron ore exist. There were in this State in 1860, 2,797,905 acres of improved land, and 1,836,445 of unimproved land, in farms; cash value of farms, \$87,178,545; and the value of implements and machinery, \$2,463,443.

Live Stock.—Horses, 75,684; asses and mules, 5644; milch cows, 86,859; working oxen, 34,135; other cattle, 98,595; sheep, 177,902; swine, 352,911. Value of live stock, \$7,997,634.

Agricultural Products, etc.—Wheat, 4,494,680 bushels; rye, 226,014; Indian corn, 11,104,631; oats, 1,242,151; barley, 745; buckwheat, 103,671; peas and beans, 12,816; potatoes, 764,939; sweet potatoes, 208,993. Value of products of the orchard, \$164,051. Produce of market gardens, \$200,869. Pounds of butter made, 3,806,160; of cheese, 3975; maple sugar, 47,740; molasses, 1430 gallons; bees' wax and honey, 74,802 pounds; wool, pounds produced, 480,226; flax, 35,686; silk cocoons, 39; hops, 1870; tobacco, 21,407,497 pounds; hay, tons of, 157,956; clover seeds, 15,217 bushels; other grass seeds, 2561; flax seed, 2446 bushels; and were made 1431 gallons of wine. Value of home-made manufactures, \$111,828; of slaughtered animals, 1,954,800.

FOREIGN COMMERCE OF THE STATE OF MARYLAND, FROM OCTOBER 1, 1820, TO JULY 1, 1856.

The Potomac River, which divides the State from Virginia, is 350 miles long, and navigable about 150 miles to Washington city. It is $7\frac{1}{2}$ miles wide at its mouth. The great falls are 14 miles above Washing-

ton; the perpendicular descent is 76 feet, and the rapids extend for several miles up the river, and form a very picturesque view. The Susquehanna is a large river which enters into the head of Chesapeake Bay in

this State. It is $1\frac{1}{2}$ miles wide at its mouth, but is navigable only 5 miles, being above that much obstructed by falls and rapids. The Patapsco is a small river, navigable, however, 14 miles to Baltimore for ships. The Patuxent is 110 miles long, and is navigable for 50 miles for vessels of 250 tons. The other rivers are Elk, Sassafra, Chester, Choptank, Nanticoke, and Pocomoke. The Chesapeake Bay is 270 miles long, and from 70 to 20 wide, and by its numerous inlets furnishes many fine harbors.

Manufactures, etc.—There were in the State in 1850, 33 cotton factories, with a capital invested of \$2,248,600, employing 1212 males and 2035 females; products valued at \$2,021,396; 43 woolen factories, with a capital of \$258,100, employing 264 males and 106 females; products valued at \$319,240; 19 establishments making pig iron, with a capital of \$1,033,500, employing 1351 persons, producing 43,641 tons of pig iron, etc., valued at \$1,048,250; 16 establishments, with a capital of \$350,100, employing 761 persons, and making 6244 tons of castings, etc., valued at \$685,000; 17 establishments, with a capital of \$780,650, employing 568 persons, manufacturing 10,000 tons of wrought iron, valued at \$771,431; 392 flouring and grist mills; 130 saw mills; 116 tanneries, with a capital of \$628,900, employing 479 persons; value of products, \$1,103,139; 59 printing-offices; 6 daily, 4 tri-weekly, 54 weekly, 1 semi-monthly, and 2 monthly publications. There were in this State (January, 1856) 3 railroads, with 466 miles of road finished and in operation, and 30 miles in course of construction. The Chesapeake and Ohio Canal, 184 miles long, is mostly in this State. Capital invested in manufactures, \$14,753,143; value of manufactured articles, \$32,477,702.

The principal places in the State are Baltimore, the metropolis; Annapolis, the capital; Havre de Grace, Frederick, Hagerstown, and Cumberland. There were (January, 1854) 25 banks, with an aggregate cash capital of \$9,558,409. The exports of Maryland in 1852 of domestic produce in American vessels amounted to the value of \$4,391,692; in foreign vessels, \$2,122,949. Foreign produce in American vessels, \$120,129; in foreign vessels, \$38,091. Total value, \$6,667,861. The imports same year in American vessels amounted to \$5,620,114; in foreign vessels, \$1,099,872. Total, \$6,719,986. Tonnage, 1852, 201,186.

For History, Finances, etc., of Maryland, see *Am. Quar.*, ix., 483; *HUNT'S Mag.*, v., 50; *Bank. Mag.*, i., 394; *Jo. Sc.*, xxvii., 1; *DE BOW'S Rev.*, x., 645.

The principal port is Baltimore, situated on the north side of the Patapsco River, about 14 miles above its entrance into the Chesapeake Bay, in lat. $39^{\circ} 17' N.$, long. $76^{\circ} 36' W.$ The harbor is spacious and convenient, and the water deep. Its tonnage in 1856 amounted to 183,344 tons. In the fiscal year, 1855-6, there were built at this port, 12 ships, 8 barks, 43 schooners, 3 sloops, with an aggregate tonnage of 15,393 tons.

Annapolis, city, port of entry, and capital of Maryland, on the Chesapeake Bay, at the entrance of Severn River. The State House is remarkable as the building in which the American Congress, during the revolutionary war, held some of its sessions. The Senate Chamber, which witnessed the last scene of the great drama of the Revolution, Washington's resignation of his commission to the Congress, has been preserved unaltered. The United States' Naval Academy, at Fort Severn, has 7 professors, and 70 midshipmen as students. Tonnage of the port in 1856, was 1332 tons.

Number of vessels built, and their tonnage, in the State of Maryland, during the year ending June 30, 1856:

District.	Ships & barks.	Brigs.	Schooners.	Sloops & canal b'ts.	Total No.	Tonnage.

Total....	12	8	110	3	133	19,918

Massachusetts, one of the eastern United States, lies between $41^{\circ} 23'$ and $42^{\circ} 52'$ north lat., and between $69^{\circ} 30'$ and $73^{\circ} 30'$ west long. It is about 190 miles long, with an average breadth of 90 miles, and contains 7250 square miles. Population in 1790 was 388,727; in 1800, 422,845; in 1810, 472,040; in 1820, 528,287; in 1830, 610,408; in 1840, 787,699; and in 1850, 994,499.

Early History.—The first and most ancient names which were given by historians to the territory of the State of Massachusetts were more or less the same with those of Maine, and we need not repeat them here. The name "*La Côte des Almouchiquo's*" (the Coast of the Almouchiquois Indians), which the French introduced, and which the Dutch geographers frequently changed to "*The Land of Almushikosen*," covered particularly the whole extent of Massachusetts. This latter name was first introduced by the English navigators and explorers. The word is said to be composed of the Indian words *Mos* (Arrowhead) and *Wetuset* (hill). The pure and correct orthography of the compound word is from this said to be *Moswetuset*, the hill in the shape of an arrowhead. The king of an Indian tribe is said to have resided on such a hill near the shores of Massachusetts Bay, and his tribe of Indians received from this, the name "*The Indians of Moswetuset*." The name is already mentioned by Captain John Smith under the year 1616. He writes it *Massachusset*. In the early times, the name was, however, corrupted in many different ways. Captain Dermer writes, in his celebrated letter on his discoveries, *Massachusit* (1619). In a letter from Plymouth in the year 1629, the name is written *Massachuets Bay*, and in the patent of Sir Fernando Gorges, repeatedly *Massachusiac*. In the earliest time of the Plymouth Colony this name included only the country round Boston harbor, and the name was principally given to that great bay, of which Boston harbor is a part, and which was called *Massachusetts Bay*. The first English colony or province was therefore not called from the country, but from the bay, "*The Colony of Massachusetts Bay*" (since 1626). The territory which this name covered was at first not extensive, but by and by it became the greatest name throughout the whole of New England. In the year 1692 the country of the Plymouth Colony was united to it, and for the whole was now introduced the name of "*The Province of Massachusetts*." So long also as New Hampshire and Maine were united to the mighty Massachusetts, during the greater part of the 17th and 18th centuries, the geographers, forgetting local names, extended the name of Massachusetts often over the greater half of all the New England seas and countries; while since 1774 the name "*State of Massachusetts*" includes the coasts between Merrimack River in the north and Narragansett Bay in the south.—J. G. KOHL.

Physical Features.—This State presents three distinct zones. The first toward the ocean, is a marine alluvion but little elevated above the sea; it is mostly sandy, and the least fertile and smallest in extent of the three sections. This plain is followed by a fine hilly tract which crosses the State from north to south, elevated in some places 300 feet above the sea; from these elevations the rivers flow in every direction. The second, or middle zone, includes part of the beautiful valley of the Connecticut, and is followed by the mountainous, but highly fertile county of Berkshire, which comprises the whole western part of the State. Through Berkshire passes two mountain ranges, the Taghkanic, on the western border of the State and between the Housatonic and Connecticut Rivers, the Green Mountain range here called the Hoosick Mountains. Mount Holyoke, near Northampton, is near 1200 feet above the level of the sea, and Wachusett Mountain in Princeton, is an elevated peak from 2000 to 3000 feet high. Saddle Mountain in the Taghkanic range in the north-west corner of the State is 4000 feet

high, and Mount Washington in the same range in the south-west corner of the State, is about 3000 feet high. The valleys of the Connecticut are fertile, as are also those of the Housatonic. There were in this State in 1850, 2,133,436 acres of land improved, and 1,222,576 of unimproved land in farms; cash value of farms \$109,076,847, and the value of implements and machinery \$3,209,584. Live stock—horses, 42,216; asses and mules, 34; milch cows, 130,099; working oxen, 46,611; other cattle, 83,284; sheep, 188,651; swine, 81,119; value of live stock, \$9,647,710.

Agricultural Products, etc.—Wheat 31,211 bushels; rye, 481,021; Indian corn, 2,345,490; oats, 1,165,146; barley, 112,385; buckwheat, 105,895; peas and beans, 43,709; potatoes, 3,585,384. Value of products of the orchard, \$463,995; produce of market gardens, \$600,020; pounds of butter made, 8,071,370; of cheese, 7,088,142; maple sugar, 795,525 pounds; molasses, 4693 gallons; beeswax and honey, 59,508 pounds; wool, pounds produced, 855,136; flax, 1162; silk cocoons, 7; hops, 121,595 pounds; tobacco, 138,246; hay, tons of, 651,807; clover seed, 1002 bushels; other grass seeds, 5085; flax seed, 72 bushels; and were made 4688 gallons of wine. Value of home-made manufactures, \$205,333; of slaughtered animals, \$2,500,924.

The principal rivers are the Connecticut, a noble stream winding for 50 miles across the State, Housatonic, which rises in Berkshire county, and flows through the west part of the State, and Merrimac, which rises in New Hampshire, and has a course of 50 miles in the north-east part of the State, and enters the ocean below Newburyport. It is navigable for large vessels to Haverhill, 15 miles. Besides these, there are Nashua, Concord, Taunton, and Blackstone Rivers. Massachusetts has numerous good harbors. There are several important islands off the south shore of this State, to which they belong. The largest is Nantucket, 15 miles long and 11 miles broad, and which constitutes a county of its own name. Martha's Vineyard, west of Nantucket is 20 miles long and from 2 to 10 miles broad, which, with other small islands, constitutes Duke's county. The shores of Massachusetts are diversified by some bold promontories and capacious bays. Of the latter, Massachusetts Bay, between Cape Ann on the north and Cape Cod on the south, is about 40 miles in breadth. Buzzard's Bay is on the south-west side of Cape Cod, and is 20 miles long. Cape Ann, in the north part of the State, is a rocky promontory 15 miles in length. Cape Cod is a peninsula in the south-east part of the State, extending 75 miles long and from 2 to 20 miles broad, with a bend in the middle nearly at right angles. The peninsula of *Nahant*, a few miles north of the harbor of Boston, is connected with the mainland by Lynn-beach two miles long. It has become, on account of its cool breezes and wild sea views, a place of fashionable resort during the summer months.

There were, January, 1856, 43 railroads, of which 1409 miles were finished and in operation, and 48 miles in course of construction. The Middlesex Canal, 27 miles long, connects Boston with Lowell. The Blackstone, and the Hampshire and Hamden Canals are both in disuse.

The value for the year of the products of industry, as found by adding the separate returns throughout the State, is found to be \$295,820,681. If allowance be made for defective and erroneous returns, the Secretary thinks the whole amount would be at least \$350,000,000. The returned value without allowance, shows an enormous increase of the productive energy of the State as compared with the previous returns, viz.:

	Production.	Population.
1837.....	\$36,282,616	700,000
1845.....	124,749,457	845,000
1855.....	295,820,681	1,183,128

That is, while the population has increased only 34 and 62 per cent. respectively; the value of the product

of industry (returned) has increased 138 and 242 per cent. The amount of capital invested in manufactures and other productions in Massachusetts, is shown to be \$120,000,000, and the gross value of products \$295,000,000 annually. The number of hands employed is 245,908. The leading products of the State in 1855, and the amount of capital employed in 1845 and 1855 are as follows:

Products.	Value. 1855.	Capital. 1855.	Capital. 1845.
	Dollars.	Dollars.	Dollars.
Cotton goods.....	26,140,000	31,961,000	17,789,000
Calico.....	5,213,000	1,980,000	1,401,000
Goods, bleached and colored.....	5,111,000	659,000	200,000
Woolen goods.....	12,105,000	7,905,000	5,604,000
Rolls and silt iron, and nails.....	5,512,000	2,342,000	1,906,000
Hollow ware and castings.....	3,256,000	1,618,000	718,000
Machinery.....	4,089,000	2,484,000	1,169,000
Steam engines and boilers.....	3,255,000	2,100,000	127,000
Railroad cars, coaches, etc.....	2,352,000	850,000	553,000
Glass.....	2,648,000	1,503,000	700,000
Paper.....	4,141,000	2,564,000	1,144,000
Musical instruments.....	2,295,000	1,280,000	298,000
Watches, chronometers, gold and silver ware.....	2,105,000	720,000	126,000
Cordage.....	2,478,000	638,000	548,000
Vessels.....	4,648,000	1,940,000
Sugar, refined.....	2,056,000	410,000
Sperm candles and oil.....	6,818,000	3,282,000	2,451,000
Soap and tallow candles.....	7,720,000	1,582,000	405,000
Chairs and cabinet ware.....	3,969,000	1,913,000	477,000
Leather.....	12,206,000	4,380,000	1,900,000
Boots and shoes.....	37,459,000
Straw bonnets.....	4,905,000
Bricks.....	2,627,000
Alcohol and liquors.....	3,153,000	964,000
Bread.....	3,592,000	640,000
Clothing.....	9,061,000	2,770,000

The actual expenditures and receipts for 1855 are contrasted with those of 1856 (mostly actual, though a portion necessarily estimated), and with the estimates for 1857, in the following table:

EXPENDITURES FOR 1855 AND 1856, CONTRASTED WITH ESTIMATES FOR 1857.

	1855.	1856.	1857.
Legislative and Executive.....	\$470,959	\$512,400	\$481,000
Scientific and Educational.....	19,889	19,420	18,350
Charitable and Humane.....	339,900	300,000	308,400
Military.....	78,339	75,250	76,000
Reformatory & Correctional.....	288,599	196,800	261,650
Interest.....	118,150	153,900	185,000
Public buildings.....	150,400	78,350
Total.....	\$1,411,237	\$1,335,620	\$1,275,800

RECEIPTS FOR 1855 AND 1856, CONTRASTED WITH ESTIMATES FOR 1857.

	1855.	1856.	1857.
Bank tax.....	\$578,983	\$583,500	\$585,000
State tax.....	428,108	600,000
Insurance tax.....	1,258	2,200	2,000

Charles R. & West Bridge.....	9,530
Sundry accounts.....	2,241	4,250
State tax of 1856—balance.....	56,000
Cash on hand.....	18,610	10,937
Total.....	\$1,666,425	\$1,452,660	\$1,751,800

For Manufactures, Finances, Commerce, etc., of Massachusetts, see *North Am. Rev.*, i., 223 (N. HALE), ii., 277; *DE Bow's Rev.*, iv., 459, lxxvi., 190; *Ch. Exam.*, xlii., 294.

COTTON MANUFACTURES IN MASSACHUSETTS IN 1855.

	Value.
Cotton mills, 294.....	1,519,527
Number of spindles.....	105,551,749
Cotton consumed.....	814,996,568
Cotton cloth.....	\$24,859,212
Unmanufact'd cotton yarn.....	\$80,546
Cotton thread.....	\$25,954
Cotton batting.....	\$85,374
Capital invested.....	\$1,961,000
Males employed.....	11,937
Females.....	22,850

In 1850, the total value of cotton manufactures in Massachusetts was \$19,712,461; in 1855, it was \$26,760,066, an increase of 36 per cent. in a period of five years. The capital increased in the same period from \$28,545,630 to \$31,961,000, an increase of only 12 per cent.

FOREIGN COMMERCE OF THE STATE OF MASSACHUSETTS, FROM OCTOBER 1, 1820, TO JULY 1, 1856.

The principal ports are: 1. Boston, lat. 42° 23' N., long. 71° 4' W. The city is situated at the head of a deep bay, on a peninsula, being surrounded on three sides by water. Generally there is sufficient depth of water to enable the largest ships to come up to the city at all times of the tide; and they usually moor alongside of docks where there is perfect safety. The depth of water in the channel varies from 15 to 30 feet. It is the great centre of the commerce of New England, and in this capacity receives and distributes one fifth of the whole commercial material of the United States. The tonnage of Boston in 1856 was 521,117 tons. See BOSRON. 2. Salem, city and port of entry. It is chiefly built on a tongue of land formed by two inlets from the sea, called North and South Rivers; over the former are two bridges (one of which is crossed by the railroad), connecting it with Beverly. The harbor has good anchorage ground, but vessels drawing more than 12 or 14 feet of water must be partially unloaded before they can come to its wharves. The tonnage of Salem in 1856 was 29,970 tons. 3. Nantucket. Tonnage in 1856, 16,857 tons. 4. New Bedford. 5. Fall River. 6. Newburyport. 7. Gloucester.

COMMERCE OF BOSTON, 1855—56.

Years.	Custom House revenue.	Foreign arrivals.
1856.....	\$3,357,024	2,990
1855.....	7,773,784	2,956

Mast, a long piece, or system of pieces, of timber, placed nearly perpendicularly to the keel of a vessel to support the yards or gaffs on which the sails are extended. When the mast is one entire piece, it is called a pole-mast; but in all larger vessels it is composed of several lengths, called lower, top, and top-gallant masts; sometimes a fourth, called a royal mast. The

method of supporting each mast on the one next below it, is peculiar. On the sides of the lower mast, some feet below the head, are placed checks: on these are fixed horizontally two short pieces of wood, fore and aft, called trestle trees. Across these at right angles are laid, before and abaft the mast, two or more longer and lighter pieces, called cross trees, which give the name to the entire system. On the mast head itself is a cap. The topmast being placed up and down, the fore side of the lower mast is swayed up between the trestle trees, and through the round or foremost hole in the cap. When raised so high that the heel of the topmast is nearly up to the surface of the cross trees, a piece of iron, called the fid, is put through the hole in the heel for the purpose; and on this fid, of which the ends are supported on the trestle trees, the topmast rests. When fidded, the topmast is stayed, and the rigging or shrouds set up to the dead eyes in the ends of the cross trees. These dead eyes pull from the lower rigging below, and thus the cross trees serve merely to extend the rigging. The topgallant is supported in the same manner on the topmast. When the mast is to be taken down, it is first raised to relieve the fid; which being drawn out, the mast is lowered. The masts are supported by a strong rope, leading forward, called the stay; by others, leading aft on each side of the ship, called, in general, backstays; and by others abreast, called shrouds, and also breast backstays. Large lower masts are composed of pieces, and have for some years been made of several lengths, about a foot or so square, and the whole supported merely by hoops at intervals. The mainmast is near the middle of the vessel, the foremast is that which is nearest the fore part, and the mizzenmast is abaft the mainmast. The old rule for the length of the main

lower mast is to take one half the sum of the length of the lower deck and extreme breadth: the foremast is eight ninths of the mainmast, the mizzenmast considerably smaller. The topmast is about three fifths of the lower mast. These rules, as well as others for the thicknesses, etc., are merely for convenience, based on no mechanical principle, and are by no means strictly followed.

Masts are still built up in pieces, but by the aid of marine glue. A joint secured by this glue is less easily separable than the actual fibres of the wood itself. In the great Exhibition of London there were many curious specimens illustrative of the use of this extraordinary cement. One was a piece of the mast of the ship *Curaçoa*, found inseparable even by the wedge. Another was part of a mainmast, from which a glued fragment was torn away only after a force of 22 tons had been applied. A third was a block of elm, joined with glue; it was exploded by gunpowder, but the joint did not yield. Another was an oak cannon-ball, made of two glued pieces; it had been fired with eight ounces of powder, but the joint held fast. Another was a deal block, which broke in the fibres by a force of four tons. Others were pieces of masts, intended to show how intensely strong a mast becomes when built up with pieces which are joined by this glue. It is not only a glue: it is also a substitute for pitch. Many vessels have the seams payed or calked with this glue, which is found much more durable for the purpose than ordinary pitch.

Master, in commercial navigation, the person intrusted with the care and navigation of the ship. "The master is the confidential servant or agent of the owners; and in conformity to the rules and maxims of law the owners are bound to the performance of every lawful contract made by him relative to the usual employment of the ship."—*ABBOTT on the Law of Shipping*. From this rule of law it follows that the owners are bound to answer for a breach of contract, though committed by the master or mariners against their will, and without their fault. Nor can the expediency of this rule be doubted. The owners, by selecting a person as master, hold him forth to the public as worthy of trust and confidence. And in order that this selection may be made with due care, and that all opportunities of fraud and collusion may be obviated, it is indispensable that they should be made responsible for his acts. The master has power to hypothecate, or pledge, both ship and cargo for necessary repairs executed in foreign ports during the course of the voyage; but neither the ship nor cargo can be hypothecated for repairs executed at home. The master has no lien upon the ship for his wages, nor for money advanced by him for stores or repairs. In delivering judgment upon a case of this sort, Lord Mansfield said: "As to wages, there is no particular contract that the ship should be a pledge; there is no usage in trade to that purpose; nor any implication from the nature of the dealing. On the contrary, the law has always considered the captain as contracting personally with the owner; and the case of the captain has, in that respect, been distinguished from that of all other persons belonging to the ship. This rule of law may have its foundation in policy for the benefit of navigators; for, as ships may be making profit and earning every day, it might be attended with great inconvenience, if, on the change of a captain for misbehavior, or any other reason, he should be entitled to keep the ship till he is paid. Work done for a ship in England is supposed to be done on the personal credit of the employer: in foreign parts the captain may hypothecate the ship. The defendant might have told the tradesman, that he only acted as an agent, and that they must look to the owner for payment." The master is bound to employ his whole time and attention in the service of his employers, and is not at liberty to enter into any engagement for his own benefit

that may occupy any portion of his time in other concerns; and, therefore, if he do so, and the price of such engagement happen to be paid into the hands of his owners, they may retain the money, and he can not recover from them.—*ABBOTT on Shipping*.

Willfully destroying or casting away the ship, or procuring the same to be done by the master or mariners, to the prejudice of the owners, freighters, or insurers; running away with the cargo; and turning pirates; are offenses punishable by transportation beyond seas for not less than 15 years, or by imprisonment for not more than 3 years. After the voyage has been commenced, the master must proceed direct to the place of his destination, without unnecessarily stopping at any intermediate port, or deviating from the shortest course. No such deviation will be sanctioned, unless it has been occasioned by stress of weather, the want of necessary repair, avoiding enemies or pirates, succoring of ships in distress, sickness of the master or mariners, or the mutiny of the crew.—*MARSHALL on Insurance*. To justify a deviation, the necessity must be real, inevitable, and imperious; and it must not be prolonged one moment after the necessity has ceased. A deviation without such necessity vitiates all insurances upon the ship and cargo, and exposes the owners to an action on the part of the freighters. If a ship be captured in consequence of deviation, the merchant is entitled to recover from the owners the prime cost of the goods with shipping charges; but he is not entitled to more, unless he can show that the goods were enhanced in value beyond the sum above mentioned. If a merchant ship has the misfortune to be attacked by pirates or enemies, the master is bound to do his duty as a man of courage and capacity, and to make the best resistance that the comparative strength of the ship and crew will allow. By the common law, the master has authority over all the mariners on board the ship—it being their duty to obey his commands in all lawful matters relating to the navigation of the ship, and the preservation of good order. But the master should in all cases use his authority with moderation, so as to be the father, not the tyrant, of his crew. On his return home he may be called upon by action of law, to answer to a mariner he has either beat or imprisoned during the course of the voyage; and unless he show sufficient cause for chastising the mariner, and also that the chastisement was reasonable and moderate, he will be found liable in damages. Should the master strike a mariner without cause, or use a deadly weapon as an instrument of correction, and death ensue, he will be found guilty, according to the circumstances of the case, either of manslaughter or murder.—*ABBOTT*, part ii., c. 4. The master may by force restrain the commission of great crimes: but he has no jurisdiction over the criminal. His business is to secure his person, and to deliver him over to the proper tribunals on his coming to his own country.

The master must not take on board any contraband goods, by which the ship and other parts of the cargo may be rendered liable to forfeiture and seizure. Neither must he take on board any false or colorable papers, as these might subject the ship to the risk of capture or detention. But it is his duty to procure and keep on board all the papers and documents required for the manifestation of the ship and cargo, by the law of the countries from and to which the ship is bound, as well by the law of nations in general, as by treaties between particular States. These papers and documents can not be dispensed with at any time, and are quite essential to the safe navigation of neutral ships during war. It is customary in bills of lading to insert a clause limiting the responsibility of the master and owners, as follows: "The act of God, enemies, fire, and every other dangers and accidents of the seas, rivers, and navigation, of whatever nature and kind soever, save risk of boats, as far as ships are

liable thereto, excepted." When no bill of lading is signed, the master and owners are bound, according to the common law. The most difficult part of the master's duty is when, through the perils of the sea, the attacks of enemies or pirates, or other unforeseen accidents, he is prevented from completing his voyage. If his own ship have suffered from storms, and can not be repaired with a reasonable time, and if the cargo be of a perishable nature, he is at liberty to employ another ship to convey it to the place of destination. He may do the same if the ship have been wrecked and the cargo saved, or if his own ship be in danger of sinking, and he can get the cargo transferred to another; and in extreme cases he is at liberty to dispose of the cargo for the benefit of its owners. The most celebrated maritime codes, and the opinions of the ablest writers, have differed considerably as to these points. According to the Rhodian law (Pand. l. 10, § 1) the captain is released from all his engagements, if the ship, by the perils of the sea, and without any fault on his part, become incapable of proceeding on her voyage. The laws of Oleron (art. 4), and those of Wisby (arts. 16, 37, 55), say that the captain may hire another ship; harmonizing in this respect with the present law of England. The famous French ordinance of 1681 (tit. *Du Frêt*, art. 11), and the *Code du Commerce* (art. 296), order the captain to hire another ship; and if he can not procure one, freight is to be due only for that part of the voyage which has been performed (*pro rata itineris peracti*). Valin has objected to this article, and states that practically it meant only that the captain must hire another ship if he would earn the whole freight. Emerigon (tom. i. p. 428) holds that the captain, being the agent not only of the owners of the ship, but also of the shippers of the goods on board, is bound, in the absence of both, to use his best endeavors to preserve the goods, and to do whatever, in the circumstances, he thinks will most conduce to the interest of all concerned; or what it may be presumed the shippers would do were they present. This, which seems to be the best and wisest rule, has been laid down by Lords Mansfield and Tenterden, as stated above, and may be regarded as the law of England on this point.

But to use the words of Lord Chief Justice Tenterden, "the disposal of the cargo by the master, is a matter that requires the utmost caution on his part. He should always bear in mind that it is his duty to convey it to the place of destination. This is the purpose for which he has been intrusted with it, and this purpose he is bound to accomplish by every reasonable and practicable method. What, then, is the master to do, if, by any disaster happening in the course of his voyage, he is unable to carry the goods to the place of destination, or to deliver them there? To this, as a general question, I apprehend no answer can be given. Every case must depend upon its own peculiar circumstances. The conduct proper to be adopted with respect to perishable goods, will be improper with respect to a cargo not perishable; one thing may be fit to be done with fish or fruit, and another with timber or iron; one method may be proper in distant regions, another in the vicinity of the merchant; one in a frequented navigation, another on unfrequented shores. The wreck of the ship is not necessarily followed by an impossibility of sending forward the goods, and does not, of itself, make their sale a measure of necessity or expedience; much less can the loss of the season, or of the proper course of the voyage, have this effect. An unexpected interdiction of commerce, or a sudden war, may defeat the adventure, and oblige the ship to stop in her course; but neither of these events doth of itself alone make it necessary to sell the cargo at the place to which it may be proper for the ship to resort. In these, and many other cases, the master may be discharged of his obligation to deliver the cargo at the place of destination; but it does

not therefore follow that he is authorized to sell it, or ought to do so. What, then, is he to do? In general, it may be said, he is to do that which a wise and prudent man will think most conducive to the benefit of all concerned. In so doing he may expect to be safe, because the merchant will not have reason to be dissatisfied; but what this thing will be, no general rules can teach. Some regard may be allowed to the interest of the ship, and of its owners; but the interest of the cargo must not be sacrificed to it. Transhipment for the place of destination, if it be practicable, is the first object, because that is in furtherance of the original purpose; if that be impracticable, return, or a safe deposit, may be expedient. A disadvantageous sale (and almost every sale by the master will be disadvantageous) is the last thing he should think of, because it can only be justified by that necessity which supercedes all human laws."—*Law of Shipping*, part iii., c. 3.

The master of a ship is liable for goods of which she is robbed, in part; and the reason, as Lord Mansfield stated, is, lest room should be given for collusion, and the master should get himself robbed on purpose, in order that he might share in the spoil. The master is, however, entitled to indemnify himself out of the seamen's wages for losses occasioned by their neglect. If any passenger die on board, the master is obliged to take an inventory of his effects; and if no claim be made for them within a year, the master becomes proprietor of the goods, but answerable for them to the deceased's legal representatives. Bedding and furniture become the property of the master and mate; but the clothing must be brought to the deck, and there appraised and distributed among the crew. If a master die, leaving money on board, and the mate, becoming master, improve the money, he shall, on allowance being made to him for his trouble, account for both interest and profit. The conditions under which seamen and apprentices are to be taken on board ship, and the obligations of the master with respect to them, are fully set forth in the article SEAMEN, in this work; and to it also the reader is referred for a statement of the duty of the master with respect to the registry of seamen, and the contributions, etc., due to the corporation for the relief of decayed seamen, their widows, etc. For the duties of the master as respects custom-house regulations, see the articles CONSULS, FREIGHT, SEAMEN, UNITED STATES, and INSURANCE, etc.; and for a further discussion of this important subject, see the excellent work of LORD TENTERDEN, *On the Law of Shipping*; PARSONS *On Commercial Law*; KENT'S *Commentaries*; CHITTY *On Commercial Law*, vol. iii.; and the articles CHARTER-PARTY, FREIGHT, etc.

Qualifications of Masters. Means by Which They Should be Ascertained.—Considering the important nature of the duties which the master of a ship has to perform, it has been customary in some countries to require that all persons, previously to their being nominated to act in that capacity, should undergo an examination by some public board respecting their knowledge of seamanship, and their possession of the various qualifications necessary to act as masters, and that none should be appointed without their being licensed by such board or other competent authority. We are inclined to think that this practice is consistent with sound policy. "The interposition of government in a case of incapacity, is not only absolutely just and necessary, but it is conformable to the highest authority. The famous French ordinance of 1681, has the following article:—'Aucun ne pourra ci-après être reçu capitaine, maître, ou patron de navire, qu'il n'ait navigué pendant cinq ans, et n'ait été examiné publiquement sur le fait de la navigation, et trouvé capable par deux anciens maîtres, en présence des officiers de l'Amirauté et du Professeur de l'Hydrographie, s'il y en a dans le lieu.' A like article has been inserted in the *Code de Commerce*; and in 1825, the French government issued

an ordinance specifying, in detail, the qualifications that are necessary before any one can obtain a certificate of his fitness to command a ship, either on a foreign or a coasting voyage; the persons who are to examine candidates; and the rules to be observed in the examination. A similar system has been adopted in Prussia; and we can not entertain a doubt that it would be of the greatest service were it introduced into this country. The authority of the master is so very great, and the trust reposed in him, including not merely the ship and goods of his employers, but the lives of the crew and passengers, so very extensive, that it is the bounden duty of the public to provide, in as far as practicable, that it be not committed to ignorant or incapable hands. At present the care of the lives of hundreds of passengers may be committed without check or control of any sort, and without their knowing any thing of the matter, to any incapable blockhead who may be able to prevail on an owner to appoint him to a ship. No doubt it is for the interest of the owner to appoint the best captain he can find; but he may be unable to form a correct estimate of the qualifications necessary for such a situation; and, though this were not the case, hundreds of circumstances may conspire to blind his judgment, and to make him select a master who is really unworthy. Hence the advantage of the preliminary examination by competent parties, which, if made efficient, would certainly afford a powerful guaranty against the chance of an unfit person being appointed."

Mastic, Mastik (Ger. *Mastix*; Du. *Mastik*; Fr. *Mastic*; It. *Mastiche*; Sp. *Almastica*, *Almaica*; Arab. *Arâh*). This resinous substance is the produce of the *Pistacia Lentiscus*, a native of the Levant, and particularly abundant in the island of Chios. It is obtained by making transverse incisions in the trunks and branches of the trees, whence the mastic slowly exudes. About 1500 cwt. are annually exported from Chios, part of which is brought to this country, packed in chests. The best is in the form of dry, brittle, yellowish, transparent tears; it is nearly inodorous, except when heated, and then it has an agreeable odor; chewed, it is almost insipid, feeling, at first gritty, and ultimately soft. Its virtues are trifling.—AINSLIE'S *Materia Indica*; THOMSON'S *Dispensatory*.

Mate, in a merchant ship, the deputy of the master, taking, in his absence, the command. There is sometimes only one, and sometimes two, three, or four mates in a merchantman, according to her size—denominated first, second, third, etc. mates. The law, however, recognizes only two descriptions of persons in a merchantman—the master and mariners; the mates being included in the latter, and the captain being responsible for their proceedings. In men-of-war, the officers immediately subordinate to the captain are called lieutenants. But the *master*, or officer whose peculiar duty it is to take charge of the navigation of the ship, has certain mates under him, termed *master's mates*, sometimes selected from the midshipmen. The boatswain, gunner, carpenter, etc., have each their mates or deputies, taken from the crew. See articles MASTER, SHIPPING, and CONSULS.

The mate is the next to the master on board, and upon his death or absence, the mate succeeds, *virtute officii*, to the care of the ship and the government and management of the crew. He does not cease to be mate in such cases, but has thrown upon him, cumulatively, the duties of master. He is *quasi* master, with the same general powers and responsibilities, *pro hac vice*, and with the preservation of his character and privileges as mate. He may sue in the admiralty for his wages as mate, and is entitled, in that character, to be cured, if sick, at the expense of the ship. The master, and even the consignees, may appoint a substitute in a foreign port, in cases of necessity. Even a supercargo, in cases of necessity, and acting with reasonable discretion, may bind the owner.

Matches, Lucifer. According to Dr. R. Boettger, in *Annalen der Chemie und Pharmacie*, vol. xlvii., p. 334, take phosphorus, four parts; nitre, ten parts; fine glue, six parts; red ochre, or red lead, five parts; smalt, two parts. Convert the glue with a little water by a gentle heat into a smooth jelly, put it into a slightly warm porcelain mortar to liquefy; rub the phosphorus down through this gelatine at a temperature of about 140° or 150° Fahr.; add the nitre, then the red powder, and lastly the smalt, till the whole forms "a" uniform paste. To make writing-paper matches, which burn with a bright flame and diffuse an agreeable odor, moisten each side of the paper with tincture of benzoin, dry it, cut it into slips, and smear one of their ends with a little of the above paste by means of a hair pencil. On rubbing the said end after it is dry against a rough surface, the paper will take fire, without the intervention of sulphur. To form lucifer wood matches, that act without sulphur, melt in a flat-bottomed tin pan as much white wax as will stand one tenth of an inch deep; take a bundle of wooden matches free from resin, rub their ends against a red-hot iron plate till the wood be slightly charred; dip them now in the melted wax for a moment, shake them well on taking them out, and finally dip them separately in the viscid paste. When dry, they will kindle readily by friction.

The Manufacture of Friction Matches.—Among articles of great demand that have become of importance, though apparently insignificant, there is nothing more worthy of notice than the friction or lucifer match. About 20 years ago chemistry abolished the tinder-box; and the burnt rag which made the tinder went to make paper. Slowly did the invention spread. The use of the match is now so established, that machines are invented to prepare the splints. In New York one match manufactory annually cuts up a large raft of timber for matches. The English matches are generally square, and thus 30,000 splints are cut in a minute. The American matches are round, and the process of shaping being more elaborate, but 4500 splints are cut in a minute. We find that a bundle of 1800 thin splints, each 4 inches long, is finally converted into 3600 matches. Without being separate, each end of the bundle is first dipped into sulphur—when dry, the splints adhering to each other by means of the sulphur, must be parted by what is called dusting.

Mats (Du. *Matten*; Fr. *Nattes*; Ger. *Matten*; It. *Stuoje*, *Stoje*; Port. *Esteiras*; Rus. *Progosshki*; Sp. *Esteras*), textures composed, for the most part, of flags, reeds, the bark of trees, rushes, grass, rattans, old ropes, etc. In this country mats are used for a great variety of purposes. The coarser sort are very largely employed in the packing of furniture and goods; in the stowage of corn and various other articles on board ship; in horticultural operations; in covering the floors of churches and other public buildings, etc. The finer sorts are principally employed in covering the floors of private houses. In Europe, mats are principally manufactured for sale in Russia, where their production is a prominent branch of national industry. They consist of the bark of the lime or linden-tree, and are known in this country by the name of *bast* mats. The Russian peasants manufacture this sort of material into shoes, cordage, sacks for corn, etc., and employ it in an endless variety of ways. In consequence of the vast quantities of matting that are thus made use of at home and sent abroad, the demand for it is immense. It is principally produced in the government of Viatka, Kostroma, and those immediately contiguous; and in the months of May and June, the period when the bark is most easily detached from the stem, the villages in the governments in question are almost deserted, the whole population being then in the woods employed in stripping the trees. The academician Köppen, who has carefully investigated this curious subject, estimates the average

annual production of mats in European Russia, as follows:

	Government of	Pieces.
Viatka.....		6,000,000
Kostroma.....		4,000,000
Kasan.....		1,000,000
Nijni Novgorod.....		1,000,000
Vologda, Tamboff, Simbirske, and Penza.....		2,000,000
Total.....		14,000,000

Köppen further estimates that about one fourth part of this vast quantity, or $3\frac{1}{2}$ millions, are exported, the rest being consumed at home. It is obvious from these statements that the annual destruction of lindentrees must be quite enormous; and it may well excite astonishment that they are not already all but exhausted. But whether it be from the rapid growth of the tree, or the vast extent of the forests in which it is found, the gloomy forebodings of Mr. Tooke as to its destruction have not hitherto been realized (*View of Russia*, iii., 262), and mats have not become either scarcer or dearer. It is, however, hardly possible to suppose that such should continue to be the case, seeing the rapid increase of population and of the consumption of matting in most parts of the empire. But in the event of its becoming scarcer, the inhabitants will have no difficulty in finding substitutes; so that we agree in opinion with those who think it would be bad policy to impose any restrictions on this branch of industry, in the view of averting an evil which may never occur; and which, if it do occur, may be easily obviated.—See *Supplément au Journal de l'Intérieur de Petersbourg*, for 1841.

Archangel is the principal port for the shipment of mats; and it appears that at an average of the years 1851 and 1852, the export of mats from that port amounted to 615,360 pieces a year. Large quantities are also shipped from Petersburg, Riga, and other ports; and most descriptions of Russian produce sent abroad are packed in mats. Various descriptions of reed mats are extensively manufactured in Spain and Portugal; some of them being very beautifully varied. In Spain large quantities of matting are made of the Esparto rush. Rush floor mats, and rattan table mats of a very superior description, are brought from China. They should be chosen clean, of a bright clear color, and should, when packed, be thoroughly dry. The mats of the Japanese are soft and elastic, serving them both for carpets and beds; they are made of a peculiar species of rush cultivated for the purpose. The bags in which sugar is imported from the Mauritius consist of matting formed of the leaves of a tree growing in the island, interwoven in broad strips. They are very strong and durable, and may be washed and cleaned without sustaining any injury. Being imported in large quantities, they are sold very cheap. (Beside the works already referred to, see MILBURN'S *Oriental Commerce*, and the valuable little work entitled *Vegetable Substances, Materials of Manufactures*, published by the Society for the Diffusion of Useful Knowledge, London.) It is probable that mats formed the first sort of woven fabrics produced by man; and it is worthy of remark that but few savage tribes have been discovered which have not attained to considerable eminence in their manufacture. On the coast of Guinea and other places in the west of Africa, pieces of fine mat, about a yard long, and of a pretty uniform texture, were denominated *makkutea*, and formed a sort of money; the value of commodities being rated and estimated in them.—MORELLET, *Prospectus d'un Dictionnaire de Commerce*. They enjoyed this distinction, no doubt, from their utility, and the great care and labor bestowed on their preparation. There is hardly an island in the South Seas in which the natives have not acquired great skill and dexterity in the making of mats. The finer sorts consist, generally, of dyed reeds or grass; and have a very brilliant appearance.

Maulmain, or **Moulmein**, a sea-port town of India beyond the Ganges, capital of the British province of Martaban, at the mouth of the great River Than-lueng, having north the Burmese town of Martaban, on the opposite side of the river, and west, the island of Balu, which serves as a natural breakwater to defend the port from the heavy seas that would otherwise be thrown in from the west, 100 miles S.S.E. of Rangoon, 27 miles N.N.E. of Amherst, lat. $16^{\circ} 30' N.$, long. $97^{\circ} 38' E.$ It was founded in 1825, when the site was selected by Sir A. Campbell as eligible as well for a commercial as a military station. It is about 200 feet above the level of the river, and extensive and fertile plains stretch eastward from it toward the mountains. Its port is good, and, from its extensive command of internal navigation, it promises to become a considerable emporium. The principal articles of export are teak-timber and rice; but there is also a considerable export of tobacco, stick-lac, betel-nut, ivory, cutch, cocoa-nuts, etc. The imports consist principally of European cotton goods and marine stores. The principal trade of the place has hitherto been carried on with Calcutta, Madras, Rangoon, and Penang; but in 1837 a direct trade was commenced with London. Owing to the facility with which supplies of teak-timber are obtained, ship-building is carried on very extensively. The population in 1848 was estimated at about 85,000. The principal article of commerce at Maulmain is teak-timber, with which from 25 to 30 ships annually load for England. The quantity of teak exported to that country from 1840 to 1847, and its estimated official value, was as follows:

Years.	No. of tons.	Price per ton.	Value.
1840.....	4,952	Rs. 25	£ 12,380
1841.....	6,399	25	15,983
1842.....	11,847	25	28,717
1843.....	10,523	30	31,554
1844.....	14,245	30	42,875
1845.....	13,360	40	53,442
1846.....	16,798	45	75,592
1847.....	7,873	50	39,365

Maulmain is a free port, on the same footing as Singapore, etc. There is no custom-house, and no duties on sea-borne goods: but foreign sugar, and sugar from Singapore and Malacca, is contraband. The coins in use are the Company's rupee and its subdivisions, the same as are current in Calcutta. The English sovereign is generally worth 11 rupees, and the Spanish dollar 220 rupees per 100 dollars. The weights are the Madras viss, equal to 3·065 lbs. avoirdupois, or, say, $3\frac{1}{4}$ lbs.; in this there are 100 ticals. The Bengal bazaar maund of 82 lbs., is also occasionally used. The measures principally used are called baskets: they are of uncertain size. A basket of cleaned rice is about 65 lbs. in weight; of mixed about 60 lbs.; paddy 51 lbs. Ship-building is well adapted to the place; and some of the finest teak-ships in the world have been built here. There are several dry docks, though not of a very efficient description, for repairing vessels. The British government bought here, during 1847, upward of 5000 tons of teak for the royal dockyards in England.

The *Maulmain Almanac* for 1852 contains the following statements: "The value of the imports by sea into Maulmain during 1850 amounted to 22,57,983 rupees, and the exports to 23,32,951 rupees; while in the first 10 months of 1851 the imports increased in value to 28,78,487, or £287,848, and the exports to 28,79,797 or £287,979. The town, which 20 years back contained only a few miserable fishing-huts, is thus shown to have a trade of nearly £600,000 a year, which is still increasing. The value of the piece goods imported from Europe during 1851 amounted to £63,229; coals, £5408, and iron £1849. Provisions were imported to the extent of £3496, and wines of the value of £492; military stores £1853, etc. The articles of export pre-

sent no remarkable feature of interest, except timber, the value of which in 1850 was £55,108, and in the first 10 months of 1851, £81,561. The town possesses a large and thriving European population, and 40 vessels, of an aggregate burden of 17,170 tons, have been launched from its dockyard since 1830. It contains three printing-presses, seven places of public worship (five of which are Protestant), besides eight schools, English and native."

Mauritius. The Isle of France was discovered by the Portuguese, A. D. 1500, but the Dutch were the first settlers, in 1598. The Mauritius was so called by the Dutch in honor of Prince Maurice; but it was first settled by the French in 1720; and is indebted for most part of its prosperity to the skillful management of its governor, the famous M. de la Bourdonnais. It was taken by the English in 1810, and was definitively ceded to them in 1814. Mauritius is fertile, a considerable part of the surface being, however, occupied by mountains. Its shape is circular, being about 150 miles in circumference. The climate is healthy, but subject to hurricanes. The principal product of the island is sugar, which is now cultivated to the almost total neglect of every thing else; but it also produces excellent coffee, indigo, and cotton. The blackwood, or ebony, of the Mauritius is very abundant, and of a superior quality. Very little corn or grain of any kind is raised in the island, most articles of provision being imported. Previously to 1825, the sugar and other articles brought to Great Britain from the Mauritius were charged with the same duties as the like articles from India; but in the above-mentioned year this distinction was done away, and it was enacted that all goods of the growth, produce, or manufacture of the Mauritius should, upon importation into any port of the United Kingdom, be subject to the same duties and regulations as the like goods being of the growth, produce, and manufacture of the British colonies in the West Indies; and that the trade with the Mauritius should be placed as nearly as possible on the same footing as that of the West India Islands. This was a great boon to the Mauritius, and the exports of sugar from it have since rapidly increased. According to Milburn (*Oriental Commerce*, ii., 568), they amounted, in 1812, to about 5,000,000 lbs. In 1818 they amounted to about 8,000,000 lbs.; and in 1824 to 23,334,553 lbs. Since 1826 nine tenths of the sugar raised in Mauritius has been shipped for the United Kingdom.

Sugar Trade.—The recent removal of the interdiction against the importation of coolies into the island of Mauritius has contributed largely to the prosperity of that colony, and materially augmented the sugar returns of 1856-57 over those of preceding years. Advices from the island, under date of July 11, refer in glowing terms to the prosperous condition of the sugar planters, and inform us of the gratifying fact—the more gratifying, inasmuch as the price of sugar has sensibly declined since that date—that "just as we are about to harvest the largest crop ever made, and the removal of the interdiction to emigration from India at the same time, has wonderfully improved the position of every landed proprietor, and has placed the colony in a high state of prosperity." In 1856 the shipments were 235,958,460 lbs., amounting in value to \$12,433,492, equal to 5-26 cents per pound. From January to May there were shipped 98,445,286 lbs., valued at \$6,042,500, or 6-13 cents per pound. The average price in 1856 was \$5 26 per 100 lbs.; and during the first five months of the present year it rose to \$6 13, showing an advance of 87 cents. The shipment of the old crop, it was believed, would be brought to a close by the end of July, and would reach nearly 220,000,000 lbs., against 235,000,000 lbs. produced in 1856. This, however, was the largest crop ever made on the island. The next crop (1857-58) it is estimated will reach 240,000,000 lbs., or 20,000,000 lbs. more than the crop now closed. We annex a statement

showing the production of sugar in Mauritius during the past seven years:

Years.	Pounds.	Years.	Pounds.
1850-51.....	116,000,000	1854-55.....	214,000,000
1851-52.....	186,000,000	1855-56.....	236,000,000
1852-53.....	160,000,000	1856-57.....	220,000,000
1853-54.....	202,000,000	1857-58.....	240,000,000

About one fourth of the number of mills in the island were already, in (July) in operation, and by the first of August sugar-making would be general. Some few parcels had reached market, and sold at high prices to complete a cargo to Australia. Thus, for vacuum claired \$9 75 to \$10; good and fine yellow, \$8 75 to \$9 25 per cwt. The news from Europe has, however, before this time arrested these advancing rates, and our next advices will show a considerable decline.

With the exception of molasses, ebony, and a few other unimportant articles, sugar is almost the only article of export. The principal imports consist of provisions, particularly grain and flour; the supply required for the use of the island being almost entirely derived from the Cape of Good Hope, Madagascar, India, Bourbon, etc. Earthenware, machinery, furniture, hardware, piece goods, wine, etc., are also largely imported. The total declared value of the exports from the United Kingdom to the Mauritius in 1852 amounted to £243,045. In 1851 the population of the Mauritius amounted, including military and seamen, to 183,506 souls, of whom between 9000 and 10,000 were whites. The population of the Seychelles—small islands dependent on the Mauritius—amounted at the same time to 8000. The emancipation of the slaves was little less injurious to the Mauritius than to the sugar colonies in the West Indies. But, owing to its more convenient situation, vast numbers of hill-coolies and other laborers from India have been enticed away and imported; and to this the increase of population and of the exports of sugar are wholly to be ascribed.

The principal imports from the United States are beef, pork, butter, cheese, candles, lard, and tobacco. The discriminating duties in favor of British produce and manufactures limit American exports to the articles above enumerated. *Ad valorem* duty 10 per cent., and specific duties various: On tobacco unmanufactured, 6 cents per pound; manufactured, 8 cents per pound; segars and snuff, 24 cents per pound. All foreign nations enjoy equal commercial privileges. The ports of the Mauritius are Mahebourg, Port Louis, and Seychelles Island.

There is some direct trade between the United States and the Mauritius. Occasionally a cargo of lumber arrives from California, but as yet this trade has not been profitable.

Maury, Matthew F.—Lieutenant Maury is a native of Virginia. He received an appointment as midshipman in the navy in 1825, and was ordered to the *Brandywine*, then fitting out at Washington, to convey the illustrious Lafayette to France. He returned home in that vessel, and in the spring of 1826 again sailed in her to the Pacific, and was absent about four years, returning in the *Vincennes* sloop. Passing his examination, he was again ordered to the Pacific station as master of the sloop-of-war *Falmouth*. From the time of his entrance into the navy he was a close student. He made himself master of the Spanish tongue, by studying a course of mathematics and navigation in that language. His work on "Navigation" he commenced in the steerage of the *Vincennes*, and it was completed in the frigate *Potomac*, to which he was ordered as acting lieutenant, when the *Falmouth* was about to return to the United States. When again Lieutenant Maury came home, he was regularly promoted to a lieutenancy, and was appointed astronomer to the South Sea Exploring Expedition, under Commander Thomas Ap-Catesby Jones. Soon after that officer gave up the command of the expedi-

tion, Lieutenant Maury retired from it also, and was afterward put in charge of the dépôt of charts and instruments which has served as a nucleus for the national observatory and hydrographical office of the United States, of which he now has charge. His labors in organizing the observatory were great and efficient, and he was successful in at once putting it on a respectable footing. The investigations of Lieutenant Maury as to the winds and currents of the ocean, the charts which he has constructed, mapping out better paths and more rapid routes across the trackless depths, and the incalculable benefits which he has thus bestowed upon the mercantile and marine interests of the world, are well known. See *South. Lit. Mess.*, vii., 560, ii., 454; *HUNT'S Mag.*, xviii., 516.

Mayagüez, or Mayaguas. This is the most important port on the island of Porto Rico. It possesses large capital, and contains several costly and fine dwellings. Rapidly rebuilt after the great conflagration, by which it was destroyed in 1841, Mayagüez has gained in prosperity; having been before that disaster but an inconsiderable village, it has now become the most important city on the island. The surrounding district produces large quantities of coffee, though, since 1840, there has been a sensible diminution in that article. For that year, the exports amounted to 80,000 quintals, while in 1853 they fell to 43,500 quintals. The coffee of Mayagüez stands in such high repute in America and Germany, that purchases are frequently made in advance of the crop. Hence comes also the best sugar of the island, which is mostly imported in American bottoms into the United States. In 1853, there arrived 83 American vessels, of 13,272 tons, carrying freight to the value of \$223,600; and there cleared 76, of 12,680½ tons, taking cargoes worth \$460,013. The molasses from this port is always of the best quality, and much sought after by American and English shippers. Besides coffee, in 1853 there were exported 165½ hogsheads of rum; 8,221 hogsheads of molasses; 20,766,033 pounds of sugar; but only 4,463 pounds of tobacco, showing a decrease, compared with the preceding year, of over 50,000 pounds. There were, besides, 1,000 hogsheads of rum mixed with tabasco pepper (*malagueta*), a preparation constituting now a new and profitable branch of domestic industry. Imports from the United States and England are generally similar to the imports into San Juan.

Mead, or Metheglin (Ger. *Mehl, Meth*; Du. *Meede, Meedrank*; Fr. *Hydromel*; It. *Idromele*; Rus. *Lipez*), the ancient, and for a long time, the favorite drink of the northern nations. It is a preparation of honey and water.

Meal (Ger. *Mehl*; Du. *Meel*; Fr. and It. *Farine*; Sp. *Farina*; Rus. *Muka*; Lat. *Farina*), the edible part of wheat, oats, rye, barley, and pulse of different kinds, ground into a species of coarse flour. See CORN, FLOUR, WHEAT, and BREADSTUFFS.

Measures and Weights. They were invented by Phidion of Argos, 869 B.C.—*Arund. Marbles*. They became general in most countries soon afterward; and were very early known in England. Standards of weights and measures were provided for the whole kingdom by the sheriffs of London, 8 Richard I., A.D. 1197. Standards were again fixed in England, 1257. They were equalized for the United Kingdom in 1825. *Measure*, in legal and commercial sense, denotes a certain quantity or portion of any thing bought, sold, valued, or the like. See WEIGHTS and MEASURES.

Meats, Preserved. The interest which has of late attached to the subject of such meats, warrants us in bringing under examination the principles and practice on which this important branch of industry is based. The art itself is of modern invention, and differs in every respect from the old or common modes of preserving animal food. These, as is well known,

depend on the use of culinary salt, saltpetre, sugar, or similar substances, which, when in solution, do not possess the power of absorbing oxygen gas, and therefore cut off effectually all access of air to the meat they protect. It might be imagined that water alone would answer this purpose; but the contrary is the case, for pure water absorbs oxygen, and is, therefore, all the less adapted for preserving meat, in proportion as it is free from saline matter, since it is then so much the more capable of combining with oxygen gas. Thus, snow, which is pure water crystalized, has a power of producing the panary fermentation when mixed with flour; and this it is able to do in consequence of the large quantity of gaseous oxygen which it contains. Similarly, rain water, and especially dew, will bring on the putrefaction of animal matters much sooner than spring water; and the vulgar prejudice respecting the effect of the moon's rays in accelerating the corruption of meat, is, beyond doubt, dependent upon the fact, that during clear moonlight nights, there is always a large deposition of dew; and this having fallen in a minutely divided state, possesses the largest amount of free oxygen, which pure or distilled water is capable of absorbing from the atmosphere, and, therefore, has a proportionate power of decomposing—just as it also has of bleaching. Thus far our remarks have been applied solely to raw or uncooked meats; but the practical bearing of the object which we have in hand really points to those which are more or less cooked or preserved. It is with reference to provisions of this kind, that a parliamentary inquiry is now in progress; and we can not do better than show the great importance of such a subject to a maritime nation, by stating, that these provisions, when sound, are an absolute preventive of sea-scurvy—a disease said, on good authority, to have destroyed more life, and to have done more damage to commerce, than all the enemies and tempests which shipping ever encountered. We need not go far in search of evidence to prove the fearful havoc caused by this disease; for we are well furnished by the history of Admiral Anson's memorable expedition, to damage the interests of Spain in the Pacific Ocean, by intercepting the annual treasure-ship or galleon on her return to Europe. In spite of every thing that care and experience could do, Anson tells us that he lost, in all, fully four fifths of his people by scurvy. Of 400 men with whom the *Centurion* departed from England, only 200 lived to reach the island of Juan Fernandez, and no more than 8 of these were capable of doing duty; and but for a supply of others at St. Helena, there would not have been strength remaining to carry the ship to her anchorage. After describing, in the most pathetic manner, the dreadful sufferings of his crew, and rejoicing at the improvement caused by the sojourn at Juan Fernandez, the writer concludes—"I therefore shall sum up the total of our loss since our departure from England, the better to convey some idea of our past sufferings and our present strength. We had buried on board the *Centurion*, since leaving St. Helena, 292 men, and had remaining on board 214. This, will, doubtless, appear a most extraordinary mortality; but yet, on board the *Gloucester* (his other ship of war) it had been much greater: for, out of a much smaller crew than ours, they had buried the same number, and had only 82 remaining alive. It might," continues Anson, "have been expected that, on board the *Tryal* (a provision ship), the slaughter would have been most terrible; but it happened otherwise, for she escaped more favorably than the rest, since she only buried 42, and has now 89 remaining." The real object of the voyage was, however, not yet commenced; though out of 960 men with which the three vessels left England, 626 were dead before this time.

It is almost superfluous to multiply instances of the same kind; though, in order to demonstrate the great

utility of preserved meats in the navy, we shall give two or three other examples.

In October, 1788, the fleet of Admiral Keppell came into harbor, and, before the end of December, had sent 3,600 sick to the hospital at Haslar. In 1779, the Channel fleet under Sir C. Hardy, sent 2,500 to the hospital, and retained more than 1000 on board for want of hospital accommodation. Within 4 months during a subsequent year, 6,064 were sent to Haslar, and Sir H. Hawkins asserts, that, within the space of 20 years, to his own knowledge, not less than 10,000 men had died of scurvy. When Admiral Geary's fleet returned to Portsmouth, after a 10 weeks' cruise in the Bay of Biscay, 2,400 men were ill of the scurvy; and the gross number of admissions into the hospital that year was 11,732, of whom 909 died. Now the highest medical authorities in this kingdom, and also on the continent, have all expressed the opinion that this fearful disease and mortality is altogether caused by the use of salt provisions; and the evidence of a host of navy surgeons and officers can be adduced to corroborate the truth of this view; therefore, not only motives of humanity, but also of self-interest, imperatively demand that; wherever unsalted provisions can be used, their employment should be insisted on by the voice of the entire nation. Such being the case, it becomes necessary for us to inquire how far the art of preserving unsalted provisions has reached that degree of uniformity, and certainty of result, which alone can warrant their introduction into the navy.—*Brande's Diet.*

Meat-Biscuits.—The American *meat-biscuits*, now coming extensively into use, are a kind of preserve differing from most others. The manufacture is located chiefly at Galveston, Texas. The prairies of that country abound in cattle of good quality, which are procured at so low a price as to justify the manufacture on the spot, thus saving the expense of transporting the useless portion of the meat. The meat-biscuit contains in a concentrated state and portable form all the nutriment of the meat, combined with wheaten or other flour. One pound of this biscuit is said to contain the nutriment or essence of five pounds of good meat; a 22-gallon cask can contain the concentrated nutriment of 500 pounds of fresh meat with 70 pounds of flour. As compared with corn or flour, the meat-biscuit is said to be less liable to heating or molding during long voyages, and less subject to the attacks of weevils and other animals. It may be easily preserved in all climates, and for a great length of time; though it is not pretended that it possesses the lasting quality of well-canistered food. The United States' Army in Mexico was supplied with these meat-biscuits; and their use is rapidly spreading in America. The meat-biscuits are made in the following way:—Good beef is selected, and boiled by steam until all the nutritive qualities are extracted. The liquor is strained, allowed to settle, and then evaporated by heat to the consistence of thick treacle; the fat is skimmed off as it rises. While the liquor is yet hot, flour is added to it, and both are kneaded up into a stiff dough, which may then be rolled, pressed, made into biscuits, and baked. The biscuits are either kept whole or are ground to powder, and are preserved in air-tight cases. For making into soup the powdered biscuit is mixed with hot water, and boiled with the addition of salt and other condiments. Professor Lindley, in a lecture before the Society of Arts, expressed an opinion that the meat-biscuit "is one of the most important substances which the exhibition of 1851 has brought to our knowledge."

Meat, Prices of. *Prices of Meat and Bread in Cities.*—The following table of the prices of wheat-bread, beef, veal, and mutton, in 20 cities of the world, near November 15th, 1856, is derived from the report of a society in the city of New York for the improvement of the condition of the poor; the quantity of

each pound avoirdupois, and the price in cents and hundredths of a cent, American weight and money:

	Wheat bread.	Beef.	Veal.	Mutton.
	Cts. per lb.	Cts. per lb.	Cts. per lb.	Cts. per lb.
Rome	5.53	7.23	7.67	9.31
London	5.70	11.74	16.68	15.57
Paris	4.44	11.33	14.04	13.62
Glasgow	5.46	13.62	13.62	12.62
Liverpool	4.63	12.90	15.90	12.90
Dublin	5.08	12.63	15.57	12.63
Antwerp	5.44	12.90	13.62	15.40
Brussels	4.63	12.76	12.76	12.76
Amsterdam	7.49	14.33	17.24	14.33
Dantzic	6.63	10.04	13.62	9.10
Oporto	5.44	8.63	12.93	9.70
Santander	4.94	6.89	8.00	8.00
Nice	4.63	11.06	11.92	11.92
Milan	5.02	10.30	10.30	7.15
Constantinople	8.76	8.17	8.17	8.17
Smyrna	5.08	6.55	10.00	10.00
New York	5.75	13.25	14.50	15.06
Boston	5.25	14.00	14.00	13.00
Philadelphia	5.25	11.50	12.50	13.50
Cincinnati	4.00	10.00	9.50	10.00

Medals, are pieces of metal, generally in the form of a coin, and impressed with some peculiar stamp, intended to commemorate some individual or action. Medals are of very different prices—varying according to their rarity and preservation, the fineness of the metal, the beauty of the workmanship, etc.

Mechanics. The time when the simple mechanical powers were first introduced is so uncertain, and perhaps so little known, that they have been ascribed to the Grecian and other deities of the heathen mythology—for instance, the ax, the wedge, wimble, etc., are said to be the invention of Dædalus. We know nothing of the machinery by which the immense masses of stone which are found in some of the ancient edifices were moved and elevated.

Mediterranean Pass. The nature of this sort of instrument has been described by Mr. Reeves, in his *Treatise on the Law of Shipping*, as follows:—"In the treaties that have been made with the Barbary States, it has been agreed, that the subjects of the King of Great Britain should pass the seas unmolested by the cruisers of those States; and for better ascertaining what ships and vessels belong to British subjects, it is provided that they shall produce a *pass* under the hand and seal of the Lord High Admiral, or the Lords Commissioners of the Admiralty. In pursuance of these treaties, passes are made out at the Admiralty, containing a very few words, written on parchment, with

ornaments at the top, through which a scolloped indenture is made; the *scolloped tops* are sent to Barbary; and being put in possession of their cruisers, the commanders are instructed to suffer all persons to pass who have passes that will fit those scolloped tops. The protection afforded by these passes is such, that no ships, which traverse the seas frequented by these rovers, ever fail to furnish themselves with them, whether in the trade of the East Indies, the Levant, Spain, Italy, or any part of the Mediterranean; and from the more particular need of them in the latter, they, no doubt, obtained the name of *Mediterranean passes*. For the accommodation of merchants in distant parts, blank passes, signed by the Lords of the Admiralty, are lodged with the governors abroad, and with the British consuls, to be granted to those who comply with the requisites necessary for obtaining them. As this piece of security is derived wholly from the stipulations made by the crown with a foreign power, the entire regulation and management of it has been under the direction of his majesty, who, with the advice of the privy council, has prescribed the terms and conditions on which these passes shall be granted. Among others, are the following:—They are to be granted for none but British-built ships, or ships made free, navigated with a master and three fourths of the mariners British subjects, or foreign Protestants made denizens. Bond is to be given in the sum of £300 if the vessel is under 100 tons, and in £500 if it is of that or more, for delivering up the pass within 12 months, unless in the case of ships trading from one foreign port to another; and such passes need not be returned in less than three years. It has been found expedient, at the conclusion of war, and sometimes during a peace, to recall and cancel all passes that have been issued, and to issue others in a new form. This has been done for two reasons. 1st. That these useful instruments, by various means, either accidental or fraudulent, came into the hands of foreigners, who, under cover of them, carried on in security a trade which otherwise would belong to British subjects, and which had been purchased by the crown, at the expense of keeping up this sort of alliance. 2d. That the Barbary States complained that, adhering to the rule of fitting the other part of the indenture to the passes, they were obliged to suffer ships to pass that did not belong to British subjects." We have thought it right to give this explanation, though, since the occupation of Algiers by the French, and the disappearance of the corsairs of the other Barbary powers, Mediterranean passes have fallen into disuse.

Mediterranean Sea (*Mare Internum*), an inland sea inclosed by Asia on the east, Africa on the south, and Europe on the north, and communicates with the Atlantic by the Strait of Gibraltar on the west, situated between lat. $30^{\circ} 20'$ and 43° north, and long. 6° and $37^{\circ} 30'$ east. Within this space is included the Tyrrhennian, Ionian, and Adriatic Seas, and the Sea of the Grecian Archipelago. The Sea of Marmora, the Black Sea, and the Sea of Azov, which communicate with it by the Strait of the Dardanelles, are considered as separate seas. The principal rivers which flow into the Mediterranean are the Ebro, Rhone, Arno, and the Tiber in Europe, and the Nile in Africa. The principal islands are Sicily (which divides the Mediterranean into an eastern and western portion), Cyprus, Crete, Malta, and the Ionian Islands in the east, and Sardinia, Corsica, and the Balearic Islands in the west. The most important gulfs are Taranto in Italy, Lepanto in Greece, Syrtis and Cades in Barbary, in the eastern portion; and Valencia in Spain, Lyon in France, Genoa in Italy, and Tunis in Africa, in the west. The winds of this sea are very variable; the tides are little felt, and very irregular. Fish is abundant in the Mediterranean, especially tunny, anchovies, pilchards, and mackerel, and the finest coral, sponge, and ambergris, are procured. The Med-

iterranean was called by the Hebrews "the Great Sea." The Phenicians are the first people known to have extended their commerce along its coasts; the Greeks afterward disputed it with them. After the destruction of Carthage, the Romans were sole masters of its shores; in the middle ages, the Venetians monopolized its commerce, and at present, England, by the possession of Gibraltar, Malta, and the Ionian Islands, possesses the greatest influence on its destinies. See GIBRALTAR.

It is estimated that three times as much water as the Mediterranean receives from its rivers is evaporated from its surface. *Vide* article PHYSICAL GEOGRAPHY, *Encyclopædia Britannica*. This may be an over estimate, but the fact that evaporation from it is in excess of the precipitation, is made obvious by the current which the Atlantic sends into it through the Straits of Gibraltar; and the difference, we may rest assured, whether it be much or little, is carried off to modify climate elsewhere—to refresh with showers and make fruitful some other parts of the earth. The great inland basin of Asia, in which are Aral and the Caspian Seas, is situated on the route which this hypothesis requires these thirsty winds from south-east trade-wind Africa and America to take; and so scant of vapor are these winds when they arrive in this basin that they have no moisture to leave behind; just as much as they pour down they take up again and carry off. We know that the volume of water returned by the rivers, the rains and the dews, into the whole ocean, is exactly equal to the volume which the whole ocean gives back to the atmosphere; as far as our knowledge extends, the level of each of these two seas is as permanent as that of the great ocean itself. Therefore, the volume of water discharged by rivers, the rains, and the dews, into these two seas, is exactly equal to the volume which these two seas give back as vapor to the atmosphere.—MAURY, *Phys. Geog.*

Commerce of the Mediterranean.—The United States' Consul at Trieste communicates to the Department of State, the following details as to increased steam navigation with the southern ports of the Mediterranean: "The project of establishing steam communication with the Mediterranean has long been a favorite one with a respectable class of merchants in the Atlantic States; and, if I am not mistaken, the experiment of a line to Genoa was tried some years ago, but without success. There is every prospect of the accomplishment of this important object, under the immediate patronage of the Austrian government. It is, in fact, proposed to construct three first-class steamships of 3200 tons, builder's measurement, and 1000 horse-power, to run between Trieste and New York, making 15 trips each way per annum, and touching at Corfu, Malta, Algiers, Cadiz, and Lisbon. The vessels would carry the mails, passengers, and goods from the East, received by the Lloyd's steamers and those of the Oriental Steam Navigation Company, and probably those of the greater part of the cities and ports of the Mediterranean, to the United States, and *vice versa*. The running time west, from Trieste to New York, would be 20 days and 14 hours; and east, from New York to Trieste, 19 days 5 hours, including stoppages. The steamers would be built in New York, but sail under the Austrian flag. The originator of this enterprise is Mr. Loosey, the Austrian consul-general at New York—a gentleman of great experience, who has resided for the past 12 years in the United States. I am credibly informed, also, that the new minister of finance, Baron de Bruck, warmly favors the scheme. He was formerly, indeed, a leading merchant in Trieste, and the founder of the Austrian Lloyd's Steam Navigation Company. If the project succeeds, its effect upon the commercial and political relations of the United States and southern Europe must be very great. While it will prove a stimulus to exertion, by opening new channels for the industry of the Old

World, it must necessarily increase the demand for the precious and abundant raw material and manufactures of the United States.

"The amount of goods exported direct from Trieste to the city of New York, during the years 1850, 1851, 1852, and 1853, amounted to \$2,085,282; and the amount of imports during the same years, from New York direct, amounted to \$1,550,515. The amount of imports during the year 1852, from the ports of Philadelphia, Boston, Savannah, Richmond, Baltimore, Mobile and New Orleans, amounted to \$1,628,700. But it would be very unfair to take these figures as any criterion of the business of the future. This country had then but partially recovered from the financial and political embarrassments of 1848-9, and confidence, without which commerce necessarily dwindles, had not been firmly established; while the means of internal communication and transportation were comparatively limited. Even now the success of this steamship project depends, in a great measure, upon the completion of the balance of 60 miles of railway between Trieste and Vienna—the last link in the chain which connects Trieste with the principal cities of Europe. This work is, however, in a state of forwardness, and will, probably, be finished in the course of a twelvemonth." See TRIESTE and TURKEY.

Commerce of the United States with the Ports of the Mediterranean.—The trade of the United States with the countries on the Mediterranean and in the Levant, is very irregular, and not yet developed. The statistics which we possess are of some value. MacGregor gives the best report on general commerce, and speaks, in regard to the Mediterranean trade in 1842, as follows:

"The commerce of the United States to the ports of the Mediterranean and Adriatic, consists chiefly in the export of cotton, sugar, dried and salt fish, whale-oil, etc., which are shipped to Trieste and other Austrian ports. The American ships take home in exchange wines and other manufactured articles. To Spain, the United States export cotton and other produce, for which they take wines, etc."

A few words, with some statistics, will suffice to show the condition of American commerce. Since that time this commerce has increased, and in some respects received a considerable impulse, but on the whole it presents nothing of much greater importance. The causes are clear: the Americans have paid, until now, very little attention to this important trade; they are not enough acquainted with it, while their successful rivals are thoroughly conversant in its sources, chances, and necessities. English and French merchants have, so far, the control of commerce in these important regions; they have agencies and branch houses—English, French, and Austrian steamers running in the Mediterranean regularly from port to port; while the Americans have not a single agency, and not one of their numerous steamers, such as navigate the ocean, the Pacific, and numerous rivers, are to be found in the Mediterranean and Adriatic. Notwithstanding the passiveness of American commerce in these regions, it is still progressive, as the following statistics will show:

The exports and imports of the United States, in the year 1842, were as follows:

	Exports.			Imports.
	Domestic produce.	Foreign produce.	Total.	
Gibraltar	\$466,937	\$116,961	\$582,998	\$12,268
Malta	11,644	8,261	19,905	7,300
France on the Mediter.	1,674,750	78,568	1,748,438	953,678
Spain	221,598	16,578	238,476	1,065,640
Italy	515,575	804,940	820,517	987,528
Sicily	287,861	195,797	493,658	539,419
Trieste	708,179	186,526	884,705	413,210
Turkey	125,451	76,515	202,036	870,248

From Tuscany and Sardinia we have no reports of 1842. The exports from Morocco to the United States

for the same year was \$98,500. In 1853 they amounted to \$84,000, all of which were in foreign bottoms.

The same in the year 1854, was:

	Exports.			Imports.
	Domestic produce.	Foreign produce.	Total.	
Gibraltar	\$446,445	\$81,327	\$527,772	\$59,678
Malta	148,528	21,245	169,373	83,695
France on the Mediter.	1,218,786	201,874	1,420,160	2,889,372
Spain	3,212,368	31,040	3,243,408	1,579,074
Italy	1,586,327	165,439	1,751,766	971,074
Sicily	246,151	18,900	260,051	959,300
Sardinia	188,806	2,020	190,826	85,676
Tuscany	11,785	37,082	48,767	1,152,717
Trieste & oth. Aus. ports	1,697,319	206,290	1,903,609	741,919
Turkey	219,496	105,702	325,198	803,114

From these figures it can be seen that the commerce in question has, as it regards some States, greatly increased. The most remarkable is that of Spain, in the Mediterranean. The export to that country has augmented 13 times. Also an important increase is seen in Malta, Italy, Trieste, and Turkey. The commerce of France, however, on the Mediterranean, diminished considerably, also that of Sicily. From both these reports we learn also, that the commerce of the United States in the Mediterranean has not been developed in such an admirable manner as with other transatlantic countries, to which numerous mail lines and other steamers are running. What influence these communications have on trade and commerce, the comparison between the trade of France on the Mediterranean, and of France on the Atlantic, shows:

EXPORT TO, AND IMPORT OF, THE UNITED STATES IN THE YEAR 1854, FROM FRANCE.

	Atlantic.	Mediterranean.
Export—Domestic prod....	\$29,749,466	\$1,218,756
Foreign ".....	978,855	201,874
Total.....	\$30,727,321	\$1,420,160
Import.....	32,892,021	2,889,372

The commerce in the first direction, where the steam-line exists from Havre to New York, shows \$63,013,842; and the commerce between the United States and France on the Mediterranean, where no steam communication exists, was only \$4,309,532. The difference is enormous! Marseilles is much behind Havre, which, by its direct steam communication with New York, attracted the greatest part of commerce. See FRANCE.

Let us take, now, a view of the countries on the Mediterranean in general. All depend for the expedition of their letters upon the English post-offices, if they do not prefer to send them via Trieste, Ostend, and Liverpool; for in both cases the postages are very high and expensive, and, as the letters have to pass through several different offices, the loss of time is, in both ways, very great. These difficulties, and we might add nuisances, have an influence in keeping the commerce back, and to them it is chiefly attributable that the commerce of these countries with the United States has progressed no faster. Mr. Baker, who lived for several years as American consul in the Mediterranean, and observed pretty closely the great progress of commerce between these parts of the globe, hinted to his countrymen, several times, to pay more attention to the Mediterranean trade.

"Thousands, on both sides of the Mediterranean," says Mr. Baker, "prefer American to other produce. Especially are flour and rice highly prized. The commerce with dried and salted fish is profitable. The greatest part of the staves and lumber which are used on the shores of Spain, are mostly imported from the United States. Also other produce, such as biscuit, different kinds of oats, sperm-oil, spermaceti candles, lard and provisions, find here ready and good markets. The port of Malaga is much frequented by American vessels; the same may be said of Barcelona, the great emporium of Spanish wines and brandies, where American import articles find good sale. But very

few American vessels visit Cartagena, Alicante, and Valencia, where American produce would be salable, with profit.

The cargoes which American ships take up in those places are mostly brandies, red and white wines, silk goods, shawls, cloths, woolen goods, paper, laces, saffron, nuts, raisins, and other dried fruits, olives, etc. As to the commerce with France, only Marseilles participates in it, and this very little, in comparison with the great trade with the United States. The advantages of Havre have already been stated. Of commercial ports, we name also Genoa, Leghorn and Messina. The old plan to connect Genoa, by a regular steamship line, with New York, has now been taken up anew, and will soon be in readiness. This connection is expected to give a powerful impulse to the Italian commerce, and also to awaken greater interest on the part of the Americans. Until now the Italian commerce with the United States has not been of much importance, compared with what it would be, had it frequent and regular communication. Of American articles, there are sugars of Louisiana and Cuba, as, also, American grain, highly appreciated, imported by Genoa, and again shipped to the Levant and other smaller ports. On the other hand, the articles imported from Genoa are many, and in the United States in fair demand. They consist in fresh and dried fruits, olive-oil, soap, silk goods, damasks, velvets, linen, gloves, ribbons, liquors, prepared marble, etc. American articles for export to Genoa, are indigo, dye-roots, honey, provisions, butter, etc. Rosin and pitch are bought freely in Genoa, and re-sold to other smaller ports in the Mediterranean.

The commerce of the United States with Tuscany presents interesting features. Tuscany exported, in the year 1854, to the United States, a value of merchandise of \$1,152,717—much more than Trieste and the other Austrian ports together. The United States exported to Tuscany, of her own and foreign produce, not more than \$48,767. This small figure is more remarkable, as American produce is in fair demand at Leghorn. For Sicily, the ports of Palermo and Messina are the most prominent. From these are exported to the United States, wines, fruits, extracts, oils, brandies, argols, tongues, sardines, prepared marble, senna, cantharides, soap, leeches, etc. The Americans export there stockfish, salted and dried meat, sugar, zinc, lead, indigo, cochineal, dye woods, cotton, cocoa, coffee, flour, tobacco, etc. The commerce of Sicily is important. England has, however, as will be seen, the lion's part.

As MacGregor relates, the import in Sicily was, in the year 1844, £744,690; the export, £1,035,026. The whole commerce with the exterior, £1,779,656. Of this the United States exported only £58,489, and imported from there, £224,988. In the year 1854, the United States exported to Sicily only \$260,051 (£52,000); and imported from there, \$959,300 (£191,860), which shows a decrease on both sides. This decrease is a peculiar fact, if we consider the quantity and quality of the articles there consumed. It can only be explained by the great activity of England, and the little attention paid to this quarter by Americans. Busied with the great commercial projects on the Atlantic, and culture in the interior, they have not yet found time to pay more attention to this commerce, and not being much posted up in the market prices in Sicily, they ignore partly the importance of that trade.

It is now time to act with energy. The energy will not be missed, while the communication with the Mediterranean will be facilitated and trade increased. The commerce of the United States with Trieste and other Austrian ports, is not satisfactory to the great wants in the trans-Atlantic markets, nor to the sales of Austrian manufactures, which are considered of very good quality. Cloths, woolen goods, linen and silk

goods, can be had from Austria, at cheap prices and in fair quality. Nevertheless, the import of the said articles, in 1853, was \$73,964,287. Other Austrian articles would also find good market here, by a regular and quick communication.

As to the Austrian ships, very few sail into the Atlantic. In the year 1854 only four Austrian ships came to the United States. Considering the passivity with which the commerce with the United States is regarded, it will not surprise us that so little is done between them. What has been exported from Austria to the United States, during 1854, via Trieste, and other Austrian ports, was not more than \$741,919; in fact a great sum compared to the many good industrial articles, and its navigation, as also its ports, of which especially Trieste and the world-renowned Venice seem to be called to play a great part in the future commerce of the United States. The export of the United States to Trieste is much larger than their import from Austria, and was, in the year 1854, not less than \$1,903,609.

The direct commerce of the United States with Turkey is fixed by the following data: to Turkey, the United States exported, in 1854, merchandise in value of \$825,198; importing from there \$808,714. This is a very poor trade, if we consider the means of both parties. This trade is in its first development and will soon be increased, if the Americans will take hold of it with their usual enterprise. Greece and the Ionian Islands are entirely forgotten by the Americans; no direct commerce is carried on from there to the United States.

Mr. Baker says, "The commerce with the Morea would be of the greatest importance to the Americans, if they would only attempt and explore it. The great quantity of produce would easily procure re-cargo to American vessels. The demand for zinc, lead, etc., is permanent, also of fish; rice, flour, and other American produce, would find easy market. The same," says Mr. Baker, "of the Ionian Islands, where a good trade would result."

Indirect Commerce.—As to the indirect commerce of the United States to the Mediterranean, there are very meagre data. The total export of the United States in 1854, to all ports in the Mediterranean, of goods not produced in the United States, was only \$953,417. These foreign productions consist in coffee, tea, cocoa, leather, skins, pepper, rum, dye-woods, sugar from Cuba, segars, cochineal, and honey.

As to the American indirect import from those countries, it is difficult to find it out. The lists of navigation give only the direct trade; and at the nominations of the value of importation from the States on the Mediterranean, no port is named from where sent.

England, which has the greatest trade with the Mediterranean ports, and which is from there extended in all directions, keeps no direct ship communication from there to the United States. Of the 8508 British ships, tonnage 1,748,380, which came, in 1854, to the United States, not more than 820 tons were from Gibraltar; not one single ton from Malta! The cause is natural. England finds it more in her interest to do the commercial trading with the Mediterranean and Levantine produce to the United States, not directly, but from Liverpool and other ports. The advantage of this proceeding is easily explained.

The English merchants receive, through Liverpool, regular reports by the Collins and Cunard steamers, of the standing of the trans-Atlantic markets. This puts them in the way to use there all the chances offering to dispose of their rich stocks of Mediterranean produce with advantage, to the United States. The same is the case in other ports of the European continent, which follow the same policy. In this way considerable quantities of red and white wines, fruits, drugs, and other produce of the Mediterranean, come by indirect commerce to America.

We take, for example, the corinthes, which are exported from Zante and Corfu to England, and other European ports, from where they are sent to the United States in small quantities. It is the same with other articles, to countries where the Americans have no direct communication. In addition to the ports already named, we can add, under the same category, the rich islands of the Turkish dominions in Europe and Asia, viz.: Cyprus, Rhodes, Candia, Samos, Mytilene. Even from ports regularly visited by American vessels, goods are sent indirectly to the United States. This is the consequence of the isolation in which the United States are placed, in relation to those ports. In Smyrna, the large storing place of the produce in the Levant, where merchants of all nations have a counting-room, there is no American. It is the same in other ports of the Mediterranean, the Adriatic, and Levant. This isolation is advantageous to the indirect intercourse of the English and French with the United States; both are in the fortunate situation to turn the chances of both hemispheres to their advantage. Mr. Baker, in speaking of the commerce of the United States with the French dominions in Africa, viz., Algiers, Tunis, Tripoli, and Morocco, says: "It would be very profitable for our commerce if the Americans would engage in this branch; they would convince themselves, very soon, that such an undertaking would be very profitable. This advice has not been followed up to this time; at least there are no statistics that there have been any imports from there. These are almost exclusively African, and mentioned only in general terms, without branches of commerce in these dominions."

The American export to Africa in general, in the year 1854, amounted to \$1,804,729; the imports to \$1,386,560; of which proportion, \$47,708 and \$30,007 belong to Madeira, Teneriffe, and other Canarian Islands, \$20,417 and \$39,598; Cape of Good Hope, \$299,958 and \$448,903. There is no data for the other African territories. According to late disclosures, there are considerable numbers of vessels which leave American ports to embark secretly in the slave-trade, land them at Cuba, and import a considerable quantity of goods from Africa. Americans can buy many kinds of African produce from the great caravans of the Mecca pilgrims, which traverse Africa in its greatest extremity to the Mediterranean.

From the above, it will be seen that the Americans appear in the Mediterranean as well as in the Levant as far less than a mercantile power of the first class. And it is but too plain that these great and rich territories, for hundreds of years the centre of shipping and commerce of well-advised nations, are, by the Americans, very much neglected. England and France are in opposition with steamers and manufactures on the Mediterranean, Adriatic, and Levant. The mail lines of Cunard, Collins, Bremen, and Havre, are not sufficient for our steam commerce with Europe, and a Mediterranean line, alone, will be found to answer the interests of American commerce. And through all this, the great project of the Pacific Railroad and Marine Telegraph across the Atlantic will the sooner be brought to completion. It is to be hoped that Trieste and the Austrian commercial community in general, will not allow such progressive movements to pass without considering that the same which has been done by the small city of Bremen, can be done by Trieste, with its powerful resources. Bremen can give satisfactory proof of the importance of a steam communication with the New World. Bremen has exported in 1854, not less than \$14,643,927. Bremen is much ahead of Hamburg, on account of its steam communication with New York, as its exports in 1854 were only \$2,322,971. Trieste would have double the advantage; it would have all the direct commerce with Austria, and the indirect connection with the Mediterranean and the New World. The project is great, but

promises well-paying results. It can be developed by a direct, regular, and quick connection with New York. It is also well to mention, that Austria would, by these means, come into a more productive relationship with the Orient, as the commerce of Austria can look to a very prosperous future, on account of the Marine Telegraph from Sardinia to Constantinople and Alexandria, as the connection of the Mediterranean and the Red Sea.—*Nautical Magazine*. For Commerce, etc., of the Mediterranean, see *Ed. Rev.*, vi., 478; *Hunt's Mag.*, vi., 201; *Fraser*, xxvii, 377; *Quar. Rev.*, lxxv., 280; same article in *Eclectic*, v., 83; *Living Age*, v., 361.

Melbourne, the capital of the British colony of Victoria, formerly Port Philip, in Australia, occupying the south-east portion of that continent, stretching through 9° of longitude, from Cape Howe on the east to the Glenelg River on the west. The town is situated on the north bank of the Yarra-Yarra River, about nine miles, following its windings, from its mouth, in the basin of Port Philip, latitude 37° 49' 5" S., long. 144° 58' 35" E. It was founded in 1837, and extends along the banks of the river. In 1851 it had a population of 23,000; and such has been the immigration consequent on the discovery of the gold-fields, that, including suburbs, it had on the 24th of April, 1854, 71,188 inhabitants. A considerable portion, however, of this immense population is to be regarded as migratory only, and as residing in town merely till their ultimate destination has been decided upon. This sudden increase of population raised house rent to an unparalleled height; and for some considerable time a large proportion of the population was not housed, but encamped under tents. But partly through the extraordinary stimulus which was thus given to building, and partly through the mercantile failures consequent to the overtrading of 1853 and 1854, there has been a very heavy fall of rents, which do not now (1855) exceed half their amount in 1852. The site of the town is unfortunate; for the river being obstructed by a bar and shallows, it is not generally navigable for vessels of more than 60 tons burden; and it has the further disadvantage of being low, and liable to be flooded by the overflowing of the river during the wet season. It has been proposed to facilitate the trade of the town by removing the bar at the mouth of the river, and deepening its channel: but this would be a very expensive undertaking, and one of which the success would be not a little doubtful. The excavation of a ship canal from the deep water in the bay to Melbourne has also been proposed; and it probably would be the preferable plan; but, in the mean time, a railway has been commenced, and is in progress to the bay, which, when completed, as is probably the case, will obviate many of the inconveniences which are now experienced. It seems, however, not unlikely that the trade of the town, and the greater part, perhaps, of its population, will ultimately centre at Williamstown, a village a few miles distant, on a headland extending into the bay, opposite to which all large vessels coming to Melbourne are obliged to anchor. The principal objection to Williamstown is the scarcity and bad quality of the fresh water; but this serious defect might, perhaps, be obviated by sinking wells, or by conveying thither a supply of water from some of the adjacent streams. Nothing can more strikingly illustrate the present unfavorable situation of the town for commercial purposes, and the extraordinary state of things which was lately prevalent there, than the fact that while the ordinary charge for the freight of goods from England to Melbourne Roads was in November, 1853, £3 10s. a ton, it was £5 to the quays.

There are very few goods or articles exported from the colony to the United States. The principal articles have been gum, in small quantities, a few hides, and some bones. With the exception of gold, on which

there is a duty of 60 cents per ounce (2s. 6d.), none are liable to duty.

IMPORTS, EXPORTS, AND POPULATION OF THE COLONY OF VICTORIA FROM 1839 TO 1853, BOTH INCLUSIVE.

Years.	Imports.	Exports.	Total of external trade.	Population, average of year.
1839.....	£205,000	278,000	£288,000	7,000
1840.....	392,000	155,000	547,000	10,000
1841.....	335,000	139,000	474,000	14,000
1842.....	264,000	204,000	468,000	19,000
1843.....	193,000	278,000	461,000	22,000
1844.....	151,000	257,000	408,000	24,000
1845.....	248,000	464,000	712,000	25,000
1846.....	316,000	425,000	741,000	34,000
1847.....	483,000	669,000	1,152,000	42,000
1848.....	874,000	675,000	1,549,000	50,000
1849.....	480,000	755,000	1,235,000	60,000
1850.....	745,000	1,042,000	1,787,000	70,000
1851.....	1,056,437	1,423,909	2,480,346	90,000
1852.....	4,043,896	7,451,549	11,495,445	180,000
1853.....	15,842,637	8,946,096	24,788,733
1854.....	16,557,404	10,109,292	26,666,696	232,000

The following statement exhibits the quantity of gold exported from the several ports in Australia in each year from the commencement of the gold discoveries to the end of the year 1855; the exports chiefly destined for Great Britain and colonial possessions:

Gold exported from New South Wales.	Quantity.	Value.
	Oz. dwts. grs.	
1851 29th May to 31st Dec...	144,120 17 16	\$2,341,680
1852.....	962,878 16 19	18,000,880
1853.....	548,052 19 21	8,905,855
1854.....	237,910 13 23	3,866,045
1855.....	64,834 14 8	1,046,250
Total.....		\$34,160,710

Gold exported from Victoria.	Quantity.	Value.
	Oz. dwts. grs.	
1851.....	145,137 3 12	\$2,193,885
1852.....	1,983,526 10 13	30,678,640
1853.....	2,497,723 15 16	43,322,645
1854.....	2,144,699 9 29	41,277,750
1855.....	2,576,745 4 17	56,819,900
Total.....		\$174,292,820
Average during last 4 years.....		\$43,573,205

To the preceding statement we annex an official return of all the gold coined at the mint in Great Britain each year from January 1, 1846, to December 31, 1855:

Gold coined in Great Britain in—

1846.....	\$21,674,556	1853.....	\$59,761,955
1847.....	25,792,200	1854.....	20,760,915
1848.....	12,259,995	1855.....	45,043,816
1849.....	10,839,775		
1850.....	7,454,181	Total...	\$269,350,299
1851.....	22,002,055		
1852.....	43,711,851	Average	\$26,935,029

For further details, see the Articles COLONIES, PRECIOUS METALS, and CALIFORNIA. Here, as in other parts of Australia, wool, down to the discovery of the gold fields, was the principal article of produce and export. And it is seen from the following statement that its exportation went on increasing down to the present year.

ACCOUNT OF THE WOOL SHIPPED DURING THE YEARS ENDING 10TH OCTOBER, 1853, 1854.

	1853.	1854.
	lbs.	lbs.
Melbourne.....	9,870,781	11,104,130
Geelong.....	7,019,900	6,643,400
Portland.....	3,475,818	4,162,432
Port Fairy.....	1,261,925	1,456,300
Port Albert.....	336,880	232,376
Total.....	21,965,104	22,598,638

A continuous high price of wool in the English markets will afford great encouragement to the settlers to struggle with these two tendencies so greatly deteriorative to our wool; and the manufacturers of Great Britain will have to afford that encouragement, or they must gradually teach themselves to look elsewhere for a supply.

EXPORTS OF VICTORIA, 1845-1853.

Years.	Produce of Victoria.	British manufactures.	Produce of British Colonies.	Produce of foreign states.	Totals.
1845.....	£451,792	£8,479	£100	£3,226	£463,597
1846.....	409,818	10,152	5,286	425,201
1847.....	652,122	13,450	2,939	668,511

Scale of Commercial Charges adopted at a Special General Meeting of the Melbourne Chamber of Commerce, 15th May, 1854.

Commissions.—On cash payments, when not in funds, 5 per cent.; on cash payments when in funds, 2½ per cent.; on purchase and shipment of gold dust, 1 per cent.; on purchase and shipment of gold dust, if drawn against, 2½ per cent.

On the amount of invoice in either case.

On purchase and shipment of merchandise and on other purchases when not in funds, 5 per cent.; on purchase and shipment of merchandise and on other purchases when in funds, 2½ per cent.; on private sales, including the purchase of bills for remittance, 5 per cent.; on guaranty of sales, including remittances, 5 per cent.; on goods received for sale and reshipped, and on consignments of merchandise withdrawn, on invoice value, 2½ per cent.; on debts, rents, and other accounts collected, recovered, and remitted, 5 per cent.; on granting of letters of credit, 2½ per cent.; on letters of credit acted upon, an additional charge of 2½ per cent.; on freight or charter procured for vessels, and freight or passage-money collected, 5 per cent.; on freight paid at port of departure, 2½ per cent.; on ships' disbursements and outfits when not in funds, 5 per cent.; on ships' disbursements and outfits when in funds, 2½ per cent.; on guaranty of captains' drafts on owners, taken for balance of ships' disbursements, 5 per cent.; on money obtained on bottomry or respondentia, 5 per cent.; on insurance effected, or orders written for insurance, on the assured value, ½ per cent.; on insurance losses, partial or total, settled, or on premiums recovered, 5 per cent.

All sales of goods understood to be guaranteed, unless there be special orders to the contrary.

Guaranty on security for contracts, 5 per cent.; acting as trustee on assignments, 5 per cent.; on advances on produce for shipment, 2½ per cent.

Auctioneers' commission and brokerage to be charged when incurred.

Advances and current accounts not liquidated at the end of the season, March 31st, the balance to be charged as a fresh advance, subject to a commission of 5 per cent.

Interest.—On advances for duty, freight, and lighterage, and on amounts occurring per annum, 10 per cent.

Charges.—For passing accounts with the government for emigrant ships, £21; for entering ship inward at the custom-house, when the original port of departure is Australia, Van Diemen's Land, or New Zealand, £2 2s.; for clearing ship outward, when

the port of destination is Australia, Van Diemen's Land, or New Zealand, £2 2s.; for entering ship inward from other ports, £5 5s.; for clearing ship outward, £5 5s.; for attending delivery of cargo from lighters, and giving notice to consignees, 15s. per day; fee for each surveyor within the city, £1 1s.; fee for survey of hatches and stowage of cargo, £1 1s.; fee for survey of hull of vessel, £5 5s.; on wool, for receiving, weighing, marking, and delivering, 1d. per load; in addition to the tare on wool, an allowance for draft of 1 lb. per cwt.

PILOTAGE RATES AT MELBOURNE, 1856.

	Sailing Vessel.		Steamer.		Maximum.	Minimum.
	s. d.	s. d.	s. d.	s. d.		
From without the Heads to Melbourne or Geelong, and <i>vice versa</i> , per ton.....	1	3	0	10	100	15
From within the Heads to Melbourne or Geelong, and <i>vice versa</i> , per ton.....	0	9	0	6	60	10
Into or out of Port Albert, p. ton	0	9	0	6	60	5
Into or out of all other ports....	0	6	0	4	40	4
Between Melbourne & Geelong.	0	6	0	4	40	4

The above rates include two removes by the pilots.

Exemptions.—All ships belonging to her majesty, all ships outfitting to or refitting from the fisheries, all ships employed in the coasting trade, all ships regularly trading between any port of Victoria and of any of the colonies of New South Wales, Van Diemen's Land, New Zealand, West and South Australia (the

master of such ship holding a certificate from the Pilot Board that he is competent to act as pilot to such trader), unless the services of a pilot shall have been actually received; and all ships not having actually received the services of a pilot.

The basin of port Philip, which receives the Yarra-Yarra, and other rivers, is a large circular bay, or inlet of the sea, whence the colony derived its former name. It has a narrow entrance, not more than 1½ miles in width, partly occupied with rocks and shoals. A lighthouse has been erected near the extremity of Point Lonsdale, near the west side of the entrance, lat. 38° 16' S., long. 140° 40' E., and another on Point Gellibrand, near the head of the bay, between Williams-town and the mouth of the Yarra-Yarra River, lat. 37° 52' S., long. 144° 55' E. The bay is about 40 miles in depth from south to north, and where widest is about 40 miles from east to west. It is said to cover an area of above 800 square miles, and might accommodate all the navies of all the countries in the world. The whole trade of the colony, which is already very extensive, and is increasing with extraordinary rapidity, is at present carried on from this basin. And from its advantageous situation, and its stretching so far inland, it is probable it will always continue to engross the largest share of the trade, though, no doubt, it will be partly, also, carried on from other ports. Geelong, at the head of a deep bay on the west side of the basin, has a large population, and a very considerable trade.

COMMERCE OF THE UNITED STATES WITH AUSTRALIA, FROM OCTOBER 1, 1837, TO JULY 1, 1856.

Memel, a commercial town of east Prussia, lat. of lighthouse 55° 43' 7" N., long. 21° 6' 2" E. Population, in 1846, 9400. Memel is situated on the north-east side of the great bay, denominated the *Currische Haf*, near its junction with the Baltic. It is, consequently, the principal entrepôt of the country traversed by the Niemen, and as such enjoys a pretty extensive commerce. The harbor of Memel is large and safe; but the bar at the mouth of the *Currische Haf* has seldom more than 17 feet water, and sometimes not more than 13 or 14 feet; so that ships drawing more than 16 feet water are frequently obliged to load and unload a part of their cargoes in the roads, where the anchorage is but indifferent, particularly when the wind is north or north-west. A lighthouse, originally 75, but now 100 feet in height, has been erected on the north-east side of the entrance to the harbor. The light, which is fixed and powerful, may be distinguished in clear weather at more than 20 miles' distance. The outer buoy lies in 6 fathoms water, about a mile without the lighthouse, which bears from it south-east by east ¼ east. The channel thence to the harbor is marked by white buoys on the north, and red on the south side. Three beacons to the north of the town, when brought into a line, lead directly into the harbor. Inasmuch, however, as the channel is subject to frequent changes,

both in depth and direction, it is always prudent, on arriving at the outer buoy, to heave-to for a pilot; but this is not obligatory; and the Prussian authorities have issued directions for ships entering without a pilot, which may be found in NORIE'S *Sailing Directions for the Cattegat and Baltic*, p. 36. Timber forms the principal article of export; for though that of Dantzic be considered better, it is generally cheaper, and almost always more abundant, at Memel. Here, as at Dantzic, the best quality of all sorts of wood articles is called *khron*, or crown, the 2d, *brack*, and the 3d, *bracks brack*. Large quantities of hemp and flax are also exported, as are bristles, hides, linseed (the finest for crushing brought to England), wax, pitch, tar, etc. The exports of grain are sometimes very considerable. The wheat of Lithuania is reckoned the best. All flax and hemp shipped from Memel must be *bracked*, or assorted, by sworn selectors. See FLAX and HEMP. The imports consist principally of salt, herrings, coffee, sugar, spices, dye-woods, tobacco, tea, iron, cotton stuffs and yarn, cutlery, wine, etc. Merchants at Memel generally send their bills to Königsberg to be sold, charging their correspondents with 1 per cent. for bank commission, postages, etc. The navigation generally closes about the latter end of December, and opens about the middle of March.

Mercantile Agency System, U. S.—The Mercantile Agency is a name applied to various houses in the leading cities of the United States, and in Montreal and London. The principal object of the Agency is to supply, to annual subscribers, information respecting the character, capacity, and pecuniary condition of persons asking credit. The valuable services it has rendered to the domestic trade of the country, as a check upon our credit system, are acknowledged by the mercantile community. Its history, together with an explanation of its mode of operation, may not be without interest to the general reader and foreign merchant.

The Agency was first established in 1841 in the city of New York, by Mr. Lewis Tappan, and was conducted by him, upon a comparatively limited scale, until 1846, when Mr. Benjamin Douglass became his coadjutor, and assumed the chief management. From this time the business increased rapidly, and assumed a permanent and recognized position among the mercantile institutions of the country.

Our limits will not permit us to trace, step by step, the growth of the Agency, or to dwell upon the personal aspects of its history. Founded upon the interests of merchants, and conducted from the beginning by men of ability, capacity for work, high character, and thorough knowledge of the wants of mercantile business, its progress has been uninterrupted. From New York it has extended its branches and associate offices to seventeen other cities, viz.: Philadelphia, Boston, Montreal, Baltimore, Richmond, Petersburg, Charleston, New Orleans, Pittsburgh, Cleveland, Cincinnati, Chicago, Milwaukee, Dubuque, St. Louis, Detroit, and London, England. All these branches are under the direction of the proprietors at New York, and are governed by uniform rules. A daily interchange of information facilitates the answering of the inquiries of the respective subscribers for all parts of the country.

It is obvious that the gigantic labor of reporting the business men of Canada and the United States could not be performed by any one office, nor could the expense be borne by the merchants of any one city. It is performed by means of their system of branch offices, each supported by the subscriptions of the merchants, bankers, and manufacturers of the city in which it is located. The district allotted to each office is the country of which its city is the centre of trade. For instance, the Boston office reports that portion of the New England States of which it has the chief trade; the Dubuque, the greater part of Iowa; the Milwaukee, Wisconsin; the Charleston, South Carolina and Georgia; while the Ohio Valley is divided between the offices at Pittsburgh, Cincinnati, and Louisville.

This subdivision of labor is the means of securing a minuteness and accuracy of reports, which, to any one unacquainted with the machinery of the Agency, is very great. The operations of a branch office do not embrace a large extent of country. They are usually limited to the 150 or 200 counties, the majority of whose traders buy their goods chiefly at the city where it is established. In each of these counties the principal of the office secures one, two, three, or more correspondents, the number varying with the population, and the division of the local trade among towns. These correspondents are selected for their integrity, long residence in the county, general acquaintance, business experience, and judgment. Their duties are to advise the Agency promptly, by letter or telegraph, of every change affecting the standing or responsibility of traders; to notify it of suits, protests, mortgages, losses by fire, indorsements, or otherwise; to answer all special inquiries addressed to them by any of the associate offices; and to revise before each trade season, or oftener if required, the previous reports of every trader in the county, noting any change for the better or worse. No report is considered full unless it embraces, in regard to each trader, his business, the

length of time he has pursued it, his success or the contrary, his age, character, habits, capacity, means, prospects, property out of business, real estate, judgments, mortgages, or other liens upon his property. The greatest care is taken in selecting the agents, who furnish the bulk of the information to the Agency. Their integrity of character, freedom from prejudice, and from any entangling connections with mercantile men, which might bias them in their reports, their social position, influence, and opportunities for knowing thoroughly the men they are reporting, are all taken carefully into consideration, and the very great success and expansion of the business is, we have little doubt, to be attributed, in a great measure, to the judgment and careful discrimination which has been exercised in this particular. Nevertheless, after all this care in the selection of the agents, prudence would seem to require some check upon them. This is done by traveling agents who are sent through the country, and who report the traders upon their own resources, and generally without any knowledge of what the local agent has previously reported. Their reports are compared carefully with those of the local agent, and any discrepancy thoroughly investigated. Again, much information of a most valuable character is derived from special correspondents, as bank cashiers, insurance agents, notaries public, sheriffs, and others, whose official position gives them peculiar opportunities of knowing not only the resources and character of business men, but also the degree of promptness with which they meet their business obligations. Another source of information is that afforded by merchants themselves, who frequently make "statements" of their own affairs from their books. These are given under their own signature, with the avowed purpose of having them used by the Agency as a basis for credit. The leading facts contained in such "statements" are of course always made matter of special investigation. As, for instance, a merchant in his "statement" says he owns a farm or a number of town lots, in a certain county, worth a certain sum. The records of the county are examined to see if any such property stands in his name; the estimate he puts upon it is compared with that given by persons acquainted with the value of property in that locality; and, lastly, a careful examination is made to ascertain if any incumbrance exists against it not mentioned in the voluntary statement of the merchant. All the other facts in his statement are scrutinized in like manner, and it is thus subjected to a very searching analysis. Reports obtained with the care thus exhibited, and from such a variety of sources, must certainly approach as near perfection as is practicable under any circumstances.

The records of each office are arranged according to counties. Each partnership and individual name is indexed for convenience of reference on inquiry being made by subscribers. The reports coming in daily are copied without delay in the book for the county to which they refer, and transmitted by mail or express to the next or central office. All unfavorable information is promptly copied on slips, and sent simultaneously to all the offices whose subscribers' interests are probably involved therein. Serious embarrassments, assignments, and failures, are telegraphed. The mass of information thus contributed by the branches to the central office passes into the hands of the chief clerk, is distributed by him to the heads of departments, by them in their turn parceled out among the clerks, and by these last recorded and indexed in the proper books. The records of the New York office of the Mercantile Agency contain the aggregate knowledge of traders possessed by the seventeen most extensive mercantile communities in North America.

A comparison of the system of the Mercantile Agency with that of the "Commercial Traveler," which it superseded, is much to the advantage of the former, as regards the item of cost as well as information. From

a large dry-goods house we learn that, in old times, its expenses for travelers counted by thousands, and that it was, to a vexatious extent, in the power of clerks, who were anxious to make sales, and whose good opinion was too often won by civilities than by responsibility. Now it holds an efficient check upon its salesmen, who travel not to choose customers, but to make collections, and obtain orders.

It has been urged as an objection to the Agency that it is *secret* in its operations, and that to the casual observer it partakes of the nature of a system of espionage, seemingly at variance with that candor and love of open dealing so characteristic of our commercial usages. This objection, with the explanations herein given, will appear utterly futile. It is necessarily of a confidential, and, to a certain extent, of a secret nature, because such communications must always be so. What merchant, banker, or president of an insurance company, who asked for and received such information as that kept by the Agency, from a business cor-

respondent, would think of using it in any other way than as confidential, and to be kept strictly secret? What would his correspondent say if his communications were used as though they were not so regarded? Who would give such information, however pure the inquirer's motive might be, unless he were assured that he could implicitly rely upon this?

The principal Mercantile Agency established in the United States is that in the city of New York. Branches and associate offices are at all the following points: New York, Boston, Philadelphia, Baltimore, Cincinnati, Louisville, St. Louis, New Orleans, Charleston, Pittsburgh, Richmond, Chicago, Cleveland, Ohio; Detroit, Michigan; Dubuque, Iowa; Milwaukee, Wisconsin; Montreal, Canada East; London, England.

[It is proper to add that the editors do not entirely coincide with the writer of the above as to the merits of the Mercantile Agency system, but insert the article as being valuable and reliable as to statements and statistics.—*Eds. Cyc. of Com.*]

STATISTICS OF BANKRUPTCY IN THE UNITED STATES FOR THE YEAR 1857.

Mercantile Law. Among the ancient Romans, trade and manufactures were accounted degrading and dishonorable employments; and what was done in that way was performed by slaves. None who had been employed in trade, or whose father had been a slave, could be chosen into the senate; and no senator, or father of a senator, could, by law, keep a bark above a certain small burden, in order, no doubt, to prevent his engaging in commerce. The Comorists likewise despised trade; and at the Council of Melfi it was solemnly determined that none could exercise any traffic, nor follow the profession of the law, with a safe conscience.

These notions, however, were singular, and very different from the policy which has ever prevailed in England. According to a law of Athelstan, if any merchant made three voyages on his own account beyond the British Channel, or narrow seas, he was entitled to the privilege of a Thane; and it is especially provided by Magna Charta (c. 30), that all merchants, unless publicly prohibited beforehand, shall have safe conduct to depart from, to come into, or to tarry in and go through the realm, for the exercise of merchandise, without any unreasonable imposts, except in time of war; and that if a war breaks out with another country, the merchants of that place shall be attached, but in their person only, till the king is informed how our merchants are treated in the land with which we are at war; and if our merchants are secure, theirs shall be so too. Upon this Montesquieu remarks, with admiration, that the English have made the protection of foreign merchants one of the articles of their national liberty; and also that the English know much better than any other people on earth how to value at the same time these three things, religion, liberty, and commerce. These, indeed, are the common rights of mankind. They are also inseparably connected together; and as liberty is the life of commerce, so commerce is in its turn the parent of man's advantages, moral and physical, personal, and political. Its protection and encouragement are now, therefore, an established principle of the law of nations.

Trade and commerce being thus the immediate offspring of natural liberty, the *lex mercatoria*, or the law of merchants, is less a branch of this or that system of municipal law, than the law of nations, or that universal law which reason teaches all men. It is, if one may so call it, an ambulatory system of civil law, not confined to any one place or locality, but attaching to the persons of men in all their commercial transactions throughout the world; the custom of merchants being everywhere acknowledged, as their persons and property are by the law of nations everywhere protected.

Thus, not to enter here at large into all the details of mercantile law, which will be found in other parts of this work, divers sorts of writing used among merchants and trading people in commercial transactions, are sustained in our courts, after the example of other States, although not executed with all the formalities of common deeds. Missive letters, *in re mercatoria*, are valid, although not holograph, and commissions from merchant to merchant, though not signed before witnesses; nor do fitted accounts among merchants, in mercantile matters, require the writer's name or witnesses. But of all obligations, *bills of exchange*, which owe their origin to merchants, are the most favored. The risks and accidents of trade have also caused particular favor to be extended to persons engaged therein, who have fallen into bankruptcy; provision being made by statute for their entire discharge on their surrendering their effects to their creditors. See LAWS OF COMMERCE.

Mercator Gerard, one of the most celebrated geographers of his time, was born at Rupelmonde, in 1512. He applied himself with such industry to geography and mathematics that he is said to have fre-

quently forgotten to eat and drink. The Emperor Charles V. had a particular esteem for him, and the Duke de Juliers made him his cosmographer. He composed a chronology, some geographical tables, and an atlas, having engraved and colored the maps himself. He died in 1594. His method of laying down charts is still used, and bears the name of *Mercator's Charts*.

Mercator's Charts. The true inventor of these charts is said to have been a Mr. Wright, who made several voyages; and in his absence Mercator published the charts in his own name, 1556.—PARDON. They are, however, now confidently ascribed to Mercator's own ingenuity. In these charts the meridians and parallels of latitude cut each other at right angles, and are both represented by straight lines, enlarging the degrees of latitude as they recede from the equator.

Mercator's Chart, or Projection, is a representation of the sphere on a plane, in which the meridians are represented by equidistant parallel straight lines, and the parallels of latitude also by straight lines perpendicular to the meridians. This projection, which is universally adopted for nautical charts, by reason of the facilities which it affords in navigation from the circumstance that the rhumb, or sailing course between two points, is represented by a straight line, was invented by Gerard Mercator (his true name was *Kauffman*, of which Mercator is the Latin equivalent), a native of Rupelmonde, in East Flanders, born in the year 1512. But, though Mercator gave his name to the projection, it does not appear that he knew the law according to which the distance of the parallels from the equator increases. The true principles of the construction were found by Edward Wright, of Caius College, Cambridge, who explained them in his treatise, entitled *The Correction of certain Errors in Navigation*, published in 1599, and are as follows: Suppose one of the meridians on the globe to be divided into minutes of a degree; one of these, taken at any parallel of latitude, will be to a minute of longitude, taken on that parallel, as the radius of the equator to the radius of the parallel; that is, as radius to the cosine of the latitude, or as the secant of the latitude to radius. This proportion holds true on the map in this sense, that if a minute of the equator be taken as the unit of a scale, and that unit be considered as the radius of the tables, then the representation of a minute of latitude will be expressed by the number in the trigonometrical tables which is the secant of that latitude. Hence, in the map, while the degrees of longitude are all equal, the degrees of latitude marked on the meridian form a scale of which the distances go on increasing from the equator toward the poles, each being (approximately) the sum of the secants of all the minutes of latitude in the degree. The numbers resulting from the addition of the secants of the successive minutes, reckoned from the equator, form a scale of meridional parts, which is given in all books of navigation. The very remarkable property of this projection, namely, that the divisions of the meridian are analogous to the excesses of the logarithmic tangents of half the respective latitudes augmented by 45° , above the logarithm of the radius, was discovered by Bond about the year 1645; but was first demonstrated by James Gregory, in his *Exercitationes Mathematicæ*, published in 1668.—*URE'S Dict.*

Mercator's Sailing is that which is performed by Mercator's charts.

Merchant, a person who buys and sells commodities in gross, or deals in exchanges, or one who traffics in the way of commerce, either by importation or exportation. The merchants of London and Amsterdam were accounted the most enterprising and richest in the world. An attempt was made by Queen Anne's ministry to exclude merchants from sitting in the House of Commons, in 1711; but it failed. The Mer-

chant Adventurer's Society was established by the Duke of Brabant in 1296. It extended to England in Edward III.'s reign, and was formed into an English corporation in 1564.—HAYDN.

Laws of Merchants.—The laws controlling merchants and commercial transactions are numerous, and are treated of in detail in the article **LAWS OF COMMERCE**. As an analysis of these laws, it may be stated, that most of the European and American countries have left uncontrolled the free action of the merchant. In Lubec every merchant is required to be a citizen. Russia has established numerous restrictions. The body of merchants are divided into three guilds or classes, to which none but Russian subjects or denizens (*i. e.* naturalized foreigners) may belong. In each guild a certain tax is imposed, and a determinate amount of capital is required; also, the nature and extent of the commercial operations permitted have proportioned limitations. Nearly every country, except Great Britain, France, and the United States, prescribes the enrollment in a public register of commerce, of the name of the merchant, the nature of his business, the name of each partner of the firm, and the dormant partners included in the firm and company, the power conferred on any party to act per procuracion, and every particular connected with the formation and dissolution of the partnership. In some countries these details must be published in the gazette and newspapers. This register is either established at the tribunals of commerce or at the civil courts. Every publicity is given to such enrollments; and any person, by paying a small fee, may obtain extracts from them. The parties interdicted from engaging in trade are, with a few exceptions, only those who are laboring under a civil disqualification.

General Regulations.—The institutions of guilds or privileged companies are of Roman origin. Traces of them still exist in London and in Scotland; but the convivial meetings in which are expended the grants, which, in ancient times, they received from government, are the only evidences of periodical revival. The word "guild" was originally applied to a society of merchants, as by the statutes of the guild in 1283, and by the statute of William, c. 35, but out of them arose all the different corporations of craftsmen. A decree, arbitral, promulgated in Edinburg, dated from "Halyrudhouse, the twenty-two day of Apryl, the year of God, one thousand four hundred fourscore three years," thus expresses the union of merchants and craftsmen in the gildry: "Toward the lang controversies for the gildrie, it is finally, with common consent, appoyntit, agreit, and concludit, that als weil craftsmen as merchants sall be received and admitted gild brether, and the one not to be refusit nor secludit therefra mair the uthir, they being burgesses of the burgh, als met and qualified thairfore; and that gild-brether to have liberty to use merchandice;" and by the same decree it is ordered, "That na manner of person be sufferit to use merchandice or occupy the hardiewark of any free craft within this burgh, or yet to exerce the liberty and privilege of the said burgh without he be burgess and freeman of the same." This decree was ratified in Parliament; and, therefore, after this period, the general right of the original gilding, or society of merchants of the realm, was abridged so far that they could not trade in Edinburg unless they were admitted as burgesses. The commercial regulations of Lubec are still founded on the same system; the merchants are divided into nine companies and colleges, and administrators, all of which bear the stamp of antiquity. Russia, besides the forming of merchants into guilds, divides commerce into various branches, and specifies what commercial operations include, with some notices of commerce with patent. France determines what are acts of trade with regard to the competency of tribunals of commerce. Holland, Wurtemberg, and a few

other countries, have similar determinations of what is comprised in commercial operations.

Who may be Parties to Mercantile Contracts.—It was once the doctrine of the English courts, that the law-merchant did not apply to any contracts between parties who were not merchants. But this view has passed away; and it has long been a well-established rule in that country as well as this, that the law merchant applies to mercantile contracts, such as negotiable notes, bills of lading, charter parties, policies of marine insurance, and the like, whoever may be the parties to them. All mercantile transactions begin and end in contracts of some kind—express or implied, executed or to be executed; and the first element of every contract is the existence of parties capable of contracting. Generally, all persons may bind themselves by contract. Whoever would resist a claim or action founded on his contract, on ground of incapacity, must make this out. See *PARSON'S Mercantile Law*.

Minors.—By the English law, a minor can not contract commercial engagements; yet he may act as a partner, and perform other functions for beneficial purposes, without being liable for contracts entered into during his minority. In Scotland, a minor may become a trader; and when he holds himself out as a major, he becomes responsible. In France, minors, by being emancipated, may engage in trade previous to the 18th year of their age, when authorized by a registered act, either of their parents or family council, or by civil authorities. They are allowed, in this case, to pledge or mortgage their estates. Similar principles are adopted in Spain, Portugal, Prussia, etc., etc.

The age at which minority ceases, is: In England, Scotland, British Colonies, United States, Hungary, Roman States, France, Normandy, Two Sicilies, etc., 21 years; in Mauritius, British Guiana, 24 years; in Cape of Good Hope, Ceylon, Holland, 25 years; in Gurnsey, Jersey (Coutume of Normandy), 20 years.

Married Females.—In London, a married female may engage in trade as a *feme sole*, but she must trade within the city, and on her account; she is, therefore, liable to be a bankrupt. In England she may engage in trade when authorized by her husband, but she is not responsible. Her endorsement, acceptance, negotiation of bills of exchange, are null, and no action can be maintained against her. The husband is liable for the debts contracted by her in a separate trade. In Scotland, parties may settle, by marriage contract, their several rights and interests. A married female can not act by or for herself.

In France, Spain, Portugal, Prussia, and Sardinia, the authority of the husband is necessary for her engaging in trade. Her property by dowry, and that held in common, are responsible for the obligations she contracts with reference to trade. The authority of the husband ought to be made public, as also the revocation of the same. In America, the common law of England is generally retained, with some exception, in Pennsylvania, Louisiana, and South Carolina. In Lower Canada and St. Lucia, same as the Coutume of Paris; and in the Mauritius it is regulated by the civil code. In Malta, a married woman may engage in trade with the consent of her husband, but she can not be imprisoned for debt. In Lubec, married females must receive the authority of the Senate for opening a shop. In Wallachia, a married female can not engage in trade without a marriage contract.

Aliens.—In Great Britain, United States and America generally, aliens enjoy the same privileges as natives with regard to trade. In France they enjoy the greatest liberty, and the same rights as the natives. In Russia and Sweden, a variety of provisions are enacted with regard to aliens, but a restriction prevails in all. In Spain and Portugal, aliens not naturalized may engage in trade, but they are established according to existing treaties with their respective govern-

ments. In Lubeck, the restrictions on foreigners are extended even to deny them the power of establishing themselves as residents, without the authority of the tribunal of judicial police. See *LEVI'S Com. Law*.

Mercury, or Quicksilver (Fr. *Vif argent*; Ger. *Quicksilber*; It. *Argento vivo*; Sp. *Azogue*; Rus. *Rtut*; Lat. *Hydrargyrum*; Arab. *Zibak*; Hind. *Parah*; Sans. *Pārada*). This metal was known in the remotest ages, and seems to have been employed by the ancients in gilding, and separating gold from other bodies, just as it is by the moderns. Its color is white, and similar to that of silver; hence the names of *hydrargyrum*, *argentum vivum*, *quicksilver*, by which it has been known in all ages. It has no taste or smell. It possesses a good deal of brilliancy; and when its surface is not tarnished, it makes a very good mirror. Specific gravity 13.568. It differs from all other metals in being always fluid, unless when subject to a degree of cold equal to -39° , when it becomes solid. The congelation of mercury was first observed in 1759.—*THOMSON'S Chemistry*. Mercury is found in various parts of the world. Among the principal mines are those of Almaden, near Cordova, in Spain; Idria, in Carniola; Wolfstein and Morsfield, in the Palatinate; Guanacavelica, in Peru, etc. Most of the ores of mercury are readily distinguished from those of any other metal: in the first variety, globules of the metal are seen attached to or just starting on the surface, which is at once a sufficient criterion, mercury being unlike every other metal; in the second, by the fine white color, and the action of the blow-pipe, which sublimes the mercury and leaves the silver behind; the third, by its beautiful deep red tint, varying from cochineal to scarlet red, excepting in those termed hepatic cinnabars, which are generally of a lead gray; the fourth, by its gray color, its partial solubility in water, and its complete volatilization by heat, emitting at the same time an arsenical odor. Before the blow-pipe, these varieties burn with a blue flame and sulphurous odor, leaving more or less residue behind them, and which may consist of earthy matter, as siliceous and alumina, together with the oxyds of iron and copper.—*JOYCE'S Chem. Min.*

Mercury is often adulterated by the admixture of lead, bismuth, zinc, and tin. When the metal quickly loses its lustre, is covered with a film, or is less fluid and mobile than usual, or does not readily divide into round globules, there is reason to suspect its purity. Our supplies of mercury are derived almost wholly from Spain. The imports usually amount to from 2,000,000 to 3,000,000 lbs., of which about 300,000 lbs. are retained for home consumption, the surplus being exported to South America, France, the East Indies, etc. The exports of quicksilver from Spain in 1848 amounted to 48,868 quintals, of which nearly 40,000 quintals were furnished by the mines of Almaden. The province of Idria, in Austria, has also some rather productive quicksilver mines. And the produce of this metal in California, and other parts of in South America, is said to be already considerable, and to be increasing. There are two sulphurets of mercury; the black or *ethiops mineral*, and the red or *cinnabar*. When mercury and sulphur are triturated together in a mortar, the former gradually disappears, and the whole assumes the form of a black powder, denominated *ethiops mineral*. If this powder be heated red-hot, it sublimes; and on a proper vessel being placed to receive it, a cake is obtained, of a fine red color, which is called *cinnabar*. This cake, when reduced to powder, is well known in commerce by the name of *vermilion*. Cinnabar may be prepared in various other ways. Calomel, or protochloride of mercury (*mercurius dulcis*) is the most useful of all the preparations obtained from it. It is in the form of a dull white, semi-transparent mass, having a specific gravity of 7.176. It is more generally employed, and with better effect, than almost any other remedy in the whole range of

materia medica. Besides its uses in medicine, mercury is extensively employed in the amalgamation of the noble metals, in water-gilding, the making of vermilion, the silvering of looking-glasses, the making of barometers and thermometers, etc. For the imports of mercury into the United States, see *QUICKSILVER*.

Meridian, in geography, a great circle supposed to be drawn through any part of the surface of the earth and the two poles, and to which the sun is always perpendicular at noon. In astronomy, this circle is supposed to be in the heavens, and exactly perpendicular to the terrestrial one.

Meridional Distance, in navigation, is the same with departure, or easting and westing, being the difference of longitude between the meridian under which the ship now is, and any other meridian which she was under before. Meridional parts, miles, or minutes, in navigation, are the parts by which the meridians in a Mercator's chart increase as the parallels of latitude decrease.

Meridian, First. The meridian from which longitudes are reckoned. The choice of the first meridian is entirely arbitrary; and most nations reckon the longitudes from their capital, or meridian passing through their principal observatories. Thus, in English works, the longitude is reckoned from Greenwich; in French, from Paris; in Russian, from St. Petersburg, etc. Ptolemy employed the Canary Islands, the French formerly reckoned from Ferro, and the Dutch from the Peak of Teneriffe. Mercator chose the Island Del Corvo. See *LONGITUDE*.

Meridian Line. A line traced on the surface of the earth, coinciding with the intersection of the meridian of the place with the sensible horizon.

Meridian of a Globe; or the Brass Meridian, is a graduated circular ring, within which the globe is suspended and revolves, and by means of which it is connected with the frame bearing the horizontal scale. Meridian lines are also traced on the globe itself, usually at 15° distance, or a difference of longitude corresponding to an hour of time. It is probable that these, with the parallels of latitude, suggested to Descartes the idea of *co-ordinates*, which he applied so successfully to connect algebra with geometry.

Merino Sheep. A breed of sheep till lately peculiar to Spain, but now reared in Saxony, England, and more particularly in Australia, chiefly for the superior fineness of their wool. The word *merino* signifies overseer of pasture lands, and is applied to this breed of sheep, because in Spain they are kept in immense flocks, under a system of shepherds, with a chief as a head, and with a general right of pasturage all over the kingdom. The best flocks of Spanish merinos are found in Leon and Castile: of the Saxon variety, at Stolpen and Rochsburg; but merinos are to be found in North America, the Cape of Good Hope, and, above all, in New South Wales, which promises to be one of the principal wool-growing countries in the world. See *WOOL*.

Merschaum (Ger.; Eng. *sea-froth*; Fr. *Ecume de Mer* *Magnésie carbonatée siliceuse*), is a white mineral, of a somewhat earthy appearance, always soft, but dry to the touch, and adhering to the tongue. Specific gravity 2.6 to 3.4; affords water by calcination; fuses with difficulty at the blow-pipe into a white enamel, and is acted upon by acids. It consists, according to Klaproth, of silica, 41.5; magnesia, 18.25; water and carbonic acid, 39. Other analysts give silica 50, magnesia, 25, water 25. It occurs in veins of kidney-shaped nodules, among rocks of serpentine, at Egribois, in the Island of Negropont, Eski-Schehir, in Anatolia, Brussa, at the foot of Mount Olympus, at Baldissero, in Piedmont, in the serpentine veins of Cornwall, etc. When first dug up, it is soft and greasy, and lathers like soap; and is on that account used by the Tartars in washing their linen. The well known Turkey tobacco-pipes are made from it, by a process analogous to that for making pottery-ware. The bowls of the pipes,

when imported into Germany, are prepared for sale by soaking them first in tallow, then in wax, and finally by polishing them with shave-grass.

Messina, *Zante* and *Messana*, a city and sea-port of Sicily capital of a province on the Strait of Messina, eight miles north-west from Reggio. Latitude of light-house $38^{\circ} 11' 10''$ N., long. $15^{\circ} 34' 7''$ E. Population 83,772. It is built on the west side of a noble harbor, inclosed by old walls; has wide, handsome streets, paved with lava, and lined with white stone houses. The port, defended by several fortifications, is formed by a long curved tongue of land, projecting north-east from the main land, and then bending westward in the form of a sickle, whence its ancient Greek name. It is about four miles in circumference, has deep water throughout, and large vessels can load and unload close to the quays. The trade is considerable. The exports comprise oranges and lemons, silk, olive-oil, wine and spirits, linseed, salt, fish, etc. The imports consist of colonial produce, cotton and woolen fabrics, hardware, and other manufactured goods. It has an active tunny and other fisheries, and manufactures of damasks and satins. Population of the province in 1851, 349,484. *The Strait of Messina (Faro di Messina)*, separates Sicily from South Italy, and unites two basins of the Mediterranean. Length, north to south, 22 miles; breadth, 10 miles to $\frac{1}{2}$ miles at its north extremity, between the Faro Tower, Sicily, and the Rock of Scylla. No bottom has been reached in it with 200 fathoms of line. On its shores are the cities of Reggio and Messina, opposite which latter is the whirlpool of Charybdis.

A treaty of reciprocity between the United States and the Two Sicilies was concluded on the 1st of December, 1845, and ratified on the 1st of June, 1846. The terms of the treaty are faithfully adhered to, inasmuch as the citizens of the United States are treated in the same manner as the subjects of the Two Sicilies. The commercial intercourse of the United States is dependent solely on the regulations of the mother country: the existing regulations are neither temporary nor fixed to a definite period, but permanent. There are no privileges permitted to the commerce of other nations which are denied to the United States. There are restrictions imposed on commerce of others which have not treaties of commerce with the Sicilian government, as to be seen in the custom-house regulations. All goods imported by privileged vessels have a per centage allowed of 10 per cent. on the import duty, and the vessels themselves enjoy all the privileges and exemptions of national vessels, except the coasting trade. The few articles shipped to the United States, on which an export duty is paid, are brimstone, oil, and linen rags; if shipped by American or Neapolitan vessels to the United States they enjoy a drawback of 10 per cent. on the export duty. The port charges consist of the tonnage duty and some small charges in the police, the custom-house, and the health-office. The tonnage duty is 8 Sicilian grains, or 4 Neapolitan bajocs per ton, which is equal to $\frac{3}{4}$ American cents. The small charges amount to nearly the same, consequently the whole port charges are from $\frac{7}{8}$ to 8 cents, United States' currency, per ton. Pilotage is \$5 for a vessel of any size. The transshipment of goods in vessels belonging to the United States is not permitted for another port in the kingdom of the Two Sicilies, although it is allowed for foreign ports without any privilege or restriction. United States' vessels may complete their cargoes in one or more ports of this kingdom, or on the Island of Sicily, without being subject to pay the tonnage duty more than once. The moneys, weights, and measures known and in common use at the different ports are not the same as those established by the supreme law of the mother country; and they are even at variance in the ports of Messina, Catania, and Syracuse.—*Com. Rel. U. S.*, 1856-7.

Metalliques, a kind of Austrian stock, so called because the interest is paid in the precious metals, and not, like the interest of other stocks, in paper money. The name was afterward used in Russia and other countries, for stocks of a similar kind.—E. A.

Mexico. Discovered in A. D. 1518. It was conquered by the Spaniards under Cortez, whose name is infamous on account of his cruelties to the vanquished, A. D. 1521. The mint of Mexico, the richest in the world, was begun in 1535. This country, like other States in the New World, has recovered its independence. Iturbide made emperor, May, 1822. Mexican constitution proclaimed by the president, Vittoria, October, 1823. Iturbide shot, July 19, 1824. Treaty of commerce with Great Britain ratified, April, 1825. Titles suppressed, May, 1826. The expulsion of the Spaniards decreed, March, 1829. Spanish expedition against Mexico surrendered, September 26, 1829. Mexican revolution; the president Guerrero deposed, December 32, 1829. The independence of Mexico, previously recognized by the great European powers, also recognized by the Emperor of Brazil, June, 1830. Civil war between Bustamente and Santa Anna, 1832. Santa Anna elected president, March, 1834. Declaration of war against France, November 30, 1838. Castle of San Juan de Ulloa taken by the French, November, 27, 1838. This war terminated March 9, 1839. Civil war, with change of leaders at various times. Santa Anna displaced Bustamente again, October 6, 1841. Insurrection of General Paredes against Santa Anna, November 5, 1844; succeeds without bloodshed, and Herrera made president, December, 1844. Paredes overturns Herrera, December, 1845. War with the United States, 1846; Mexicans defeated at Palo Alto, May 8, 1846, and subsequently at Matamoras. Santa Fé captured, August 23, and Monterey September 24, 1846. Mexican Congress authorized their government to raise \$15,000,000 for the war against the United States, upon the mortgage or sale of church property, January 8, 1847. Battle of Buena Vista, February 22, 1847. Vera Cruz surrendered to General Scott, March 29, 1847. Battle of Cerro Gordo, April 18. General Paredes landed at Vera Cruz in disguise, August 14, 1847. Battles of Contreras and Churubusco, August 20, 1847; of Chapultepec, September 12. Surrender of City of Mexico to American General Scott, September 14, 1847. Treaty of peace with the United States ratified at Queretaro, May 30, 1848. Mexico evacuated by the American troops, June 12. Paredes excites a revolt at Guanajuato, June 15. Herrera becomes president, July 6. Bustamente defeats Paredes, July 18. Vera Cruz surrendered by the United States, August 1. Signor de la Rosa first Mexican minister to the United States after the war, presented his credentials, December 2, 1848. See *MAYER'S Mexico*; *POINSETT'S Notes on Mexico*; *DE BOW'S Rev.*, ii., 27, 165 (J. R. POINSETT), v., 401; *North Am. Rev.*, xliii., 226 (Judge BULLARD), xx., 77 (J. SPARKS); *HUNT'S Mag.*, x., 118 (B. MAYER), xv., 250, xvi., 455.

The territory constituting the republic of Mexico has an area of 855,964.49 square miles, and forms, in its political divisions, 21 States, a Federal District, and three Territories. The population has somewhat augmented since the time of its independence, and the census (Tejada's) of 1850 states its position and numbers as follows:—No two authorities agree as to the area and population of Mexico.

Area in 1821.	Ceded to U. S. by treaty of 1848.	Area in 1852.*	Population in 1851.
Sq. leagues.	Sq. leagues.	Sq. leagues.	
216,012.27	109,944.80	106,067.47	7,659,919

* By the treaty of Dec. 30, 1853, defining more accurately the boundary between Mexico and the United States, additional territory was ceded to the latter, for the consideration of \$10,000,000.

More recent returns would indicate a greater increase of the white than other classes of population;

but it is probably explained by the fact that certain literary acquirements define color, and that successful efforts have been made to advance the common education in many of the States. A census stated to have been taken in 1864, makes some very slight alterations in the preceding table. It raises the population to 7,853,394.

Along the eastern declivity of the Cordillera of the Andes, from 3000 to 4000 feet above the level of the sea, grow the coffee and tobacco, both of unusual excellence; but the coffee is heavily burdened with the internal taxes of the States, and the sale of tobacco is a monopoly of the government; so that, with these restrictions upon them, their cultivation languishes. From this elevation to the sea is the country of cane, of the product of which little is at present exported. Cochineal, which has greatly diminished in quantity within the past few years, has become of little importance. Wheat, the growth of the table-lands, is equal to the best in the world, and, when not absolutely forbidden, a heavy duty rests upon the imported article, which, unless in times of scarcity, is equal to a prohibition. The lands of the people of the hot and temperate climates are chiefly taxed with this great difference; and, in consequence, the flour is brought to them, often a distance of 200 miles, on mule-back, instead of being received at a fair and cheaper rate from abroad, by the sea. This weight falls heavily upon the State of Vera Cruz, and exists for the benefit of the proprietors of the wheat-fields, principally of Puebla; but force and wealth prove ever to abide with the latter State, in every attempt to obtain relief. Nor do the burden and vexation stop here. Notwithstanding the exemption seemingly given to the imported article from other than the federal duties, the owner has often to pay other sums at the ports of entry, in the nature of municipal duties, and at every remove from State to State.

Maize, although indigenous to the table-lands, and growing in every climate of the republic, is rarely to be found at a low price anywhere; and this, not from any failing of industry or a want of knowledge in its cultivation, but from droughts that continue, at times, for years, and sometimes until districts are half depopulated. Even in the fertile valley of Mexico, about the capital itself, corn usually bears a price of about \$2 the bushel. The cotton, wherever it has been attempted to be raised, has been materially and discouragingly affected by insects; and the article is yearly the subject of special licenses to individuals, to be introduced at Vera Cruz at rates lower than those designated by the tariff, to supply the calls of cotton manufactories. The vine and the olive have been attempted to be cultivated since the revolt from Spain, but with poor, or only partial success. The price of the *maguey*, both in its natural state as *pulque*, and as the distilled liquor made from it, *mescal*, is an important item in the economy of considerable territories, but of no consideration in commerce. The pith of some varieties of the plant, baked like a potato, is, in many places, the food for nearly the year round of the half-wild tribes of the *sierras*; and the spirituous extract is the inebriating draught that keeps a large portion of the population about the cities and towns where it can be raised or bought, in a state of wretchedness and physical destitution.

The principal manufactures of Mexico are sugar and rum, aloe, wine, and brandy, earthen and stone ware, glass, paper, and tissues of cotton, wool, and silk. M. Lerdo de Tejada estimates the entire value of the manufactures of all kinds in Mexico, annually, at \$80,000,000 to \$90,000,000.

The production of gold and silver in the republic has arrived at a state of great prosperity; but the inadequate supply of quicksilver is felt as a considerable obstacle to the still greater development of the mineral wealth of Mexico.

Manufactures.—The principal products of Mexican industry are brandy, and sugar made from cane, mescal, made from the juice of the maguey, oil, wine, and brandy made from grapes, earthen and glass wares, paper and spun and woven cotton, silk and woolen. Sugar is made in mills on all the estates where the cane is cultivated, and which are found chiefly in the States of Vera Cruz, Tabasco, Yucatan, Mexico, Guerrero, Michoacan and Guadaluajara; and brandy by stills in most of them. Although the ancient and imperfect system is generally pursued, some improvements have begun to be introduced, of which may be cited the apparatus lately put up on the hacienda of La Puga, near Tepic, that of San Carlos, in the Cañada of Cuautla, and in Silva, four leagues from San Juan Bautista de Tabasco, for sugar-making and distilling brandy. For the making of oil there are already in the capital 49 mills, besides those in Tacubaya, Toluca and Puebla. Not only oil is made in them from olives, which nearly supplies the consumption, but from ajonjote, linseed, rape-seed, colwort, higuierola, almonds, cacahuates, small nuts, and finally from calves' and pigs' feet, etc., to oil wheels and machinery. With respect to grape-wine and brandy, although there were vineyards in several States, they are manufactured only in those of Guanajuato, Coahuila, Lower California, Sonora, and Chihuahua, from the last of which are annually made more than 600 barrels of brandy, 300 of wine, and 200 tierces of raisins. For the manufacture of earthen vessels of all kinds there are establishments in the republic, where they are made with much skill, the best in Mexico, Guanajuato, and Guadaluajara. In fine pottery, great improvements have been recently made in Puebla, where the business has been carried on from very remote times, in Salamanca, in the state of Guanajuato, and lately in the capital a manufactory excels all the rest. There are four establishments for plain glass in the capital, and the States of Mexico and Puebla, the product of which exceeds the consumption. There are eight paper mills in the Federal District, and the States of Mexico, Puebla and Jalisco, which not only supply the demand for the press, but for other purposes, particularly writing-paper equal to that of other countries. The scarcity of linen rags requires most of the paper to be made of cotton, though some is made of linen, and also of the filaments of the maguey. Although many hand-wheel looms are used in making cotton fabrics, as rebozos, mantas and other ordinary articles, there are 62 large establishments moved by machinery, in the Federal District, and the States of Coahuila, Durango, Jalisco, Puebla, Mexico, Queretaro, and Vera Cruz. Although some pretty fine linens are made in them, they are but few, the chief part being hilazas and mantas, which in 1845 amounted to 3,000,000 pounds of the hilazas and 1,000,000 pieces of the latter. The manufactory of rebozos in the city of Zamora in the State of Morelia, is worthy of particular notice. For woolen fabrics, besides the numerous shops in which are manufactured ordinary cloths and various common articles, there are seen large establishments in the district and the States of Mexico, Queretaro, Zacatecas and the territory of Hoxcala, in which are made cloths, cassimeres, carpets, baize, etc., which compete with those imported, both in quality and in price. In spinning and winding silk, more than 60 hand machines are in the capital, Puebla and Guadaluajara, and the products are preferred to the foreign. In the capital is a machine by horse-power, on the French plan, which can spin above 100 lbs. a day. About 40,000 lbs. are estimated to be spun in Mexico annually. The only woven silk yet made are some rebozos and bands. All kinds of fancy trimmings are made in Mexico, as buttons, cords, braids, and many ornaments of cotton, wool, and silk; and the best factory is that of the Hopicio for the poor in the capital, where they are as well made as in Europe. Gold and

silver thread of all kinds are made, and bugles, spangles, galloon, cords and belts of silver and gold, and bells of silver and copper. Oil-cloths are made, of qualities and patterns equal to foreign. Many other minor articles are also manufactured, to a considerable amount annually. An establishment for stearine candles has been commenced, under an exclusive privilege. According to the estimates of Señor Quiros in 1817, this branch of products amounted to \$16,011,818; they are now, probably, not less than \$80,000,000 or \$90,000,000.

Mineral Resources of Mexico.—In a period of 27 years, from 1825 to 1851, both inclusive, the average value of the precious metals annually exported was \$9,481,042, as appears from a recent work of Miguel Lerdo de Tejada, "*Comercio de México des de la Conquista hasta hoy*," which gives the following table of the amounts legally exported in coin and otherwise, during the period designated:

Years.	Value.
1825.....	\$3,702,447
1826.....	3,547,795
1827.....	9,669,428
1828.....	12,287,288
From July, 1829, to June, 1830.....	12,022,312

It is believed that immense quantities of sulphur, sufficient, it is stated, to supply the manufacturing wants of the whole world, are to be found in the State of Puebla. A late Mexican paper says, in reference to these sulphur-beds: "The volcano of Popocatepetl is no uncertain or chance enterprise. It possesses a real and certain treasure, and that treasure is the inexhaustible amount of pure sulphur which is springing up every day in infinite abundance from its bowels." The *Siglo* newspaper, published in Mexico, says: "The United States consume annually, in manufactures, sulphuric acid to the amount of the enormous sum of \$18,000,000 to \$22,000,000; and, perhaps, it would not be out of the way to estimate the imports of sulphur into Great Britain at nearly the same amount. In these two countries alone, we should find a market for over \$30,000,000 worth annually. The price of sulphur is now at about \$50 per ton, in the English and American markets, for the article brought from Vesuvius and the sulphur-beds of Italy. The article from Popocatepetl would, of course, command a higher price, from its superiority. * * * The supply in Vesuvius is limited, while that of Popocatepetl would find little diminution by the labor of a century." There seems to be no doubt of the existence of incalculable quantities of pure sulphur in the vicinity of this volcano. From observations actually made, and estimates formed on the spot, by scientific officers, it is believed that the sulphur thrown up and hardened may be set down at millions of millions of arrobas. The government of Mexico has already given attention to this subject. The stipulations by which commercial relations between the United States and the republic of Mexico are regulated are found in the treaty of April 5, 1831, and that of May 30, 1843; the latter known as the treaty of Guadalupe Hidalgo.

Article 8d of the latter treaty provides that all the custom-houses then in possession of officers of the United States should be immediately restored to the Mexican authorities, together with all bonds and evidences of debt for duties on imports and exports not fallen due; and further, that all duties collected at such custom-houses by the United States' officers, from and after the ratification of the treaty, shall, after deducting the cost of collection, be delivered over to the Mexican government, at the city of Mexico, within three months after the exchange of ratifications.

Articles 6 and 7 relate to the navigation of the Gulf of California, the Rivers Colorado and Rio Bravo del Norte (annulled by 4th article of the treaty of December 30, 1853, ratified and exchanged 30th June, 1854). Article 17 revives treaty of 1831 for 8 years, with the usual stipulation of 12 months' notice by either party desirous of terminating the same. From the treaty of 1831 the "additional article" is excepted, and also such stipulations as are incompatible with the treaty of 1848. Article 20 continues in force, for 60 days after the ratification of the treaty, the tariff established by the United States at ports and places occupied by their forces. Article 21 provides for the appointment of commissioners or arbitrators to settle any disagreements which may hereafter arise between the two governments concerning the political or commercial relations of the two countries. Article 22 prescribes rules and proceedings to be followed, should a war unhappily break out between the two republics, and covenants protection, etc., for the citizens of each residing in the other; and also provides that this article shall not be annulled under the pretense that war dissolves all treaties, or under any other pretense whatever.

The treaty of 1831, revived by the 17th article of the treaty of 1843, secures to the citizens of each country, in the territory of the other, equal footing with the citizens and subjects of all foreign nations, and provides that neither country shall grant any particular favor to other nations in respect of commerce and navigation, that shall not immediately become common to the other party; no higher or other duties, imposts, or fees whatsoever, to be paid by the citizens or vessels of either country in the ports of the other, than are, or may be, paid by the citizens or vessels of the most favored nation; all merchandise, the produce, growth, or manufacture of either country, imported into the other, to be subject to no higher or other duties than similar importations from any other foreign country; no export duties or prohibitions to be prescribed by either country, that shall not equally apply to all other foreign nations; the vessels of both countries, in the ports of either, to be placed on the footing of national vessels, as respects tonnage duties, light or harbor dues, pilotage, salvage in case of damage or shipwreck, or any other local charges, the coasting trade being reserved by each of the high contracting parties to its own vessels, respectively; the duties on imports and exports of articles, the growth, produce, or manufacture of either country, to or from the ports of the other, to be the same, whether such importations or exportations take place in vessels of the United States or of Mexico; all merchants, captains, commanders of vessels, and other citizens of either country, to have full liberty to manage, themselves, their own affairs, or choose their own brokers, factors, agents, or interpreters in the ports and territories of the other. The fourth section of the 34th article saves from the operation of this treaty all former or existing treaties with other sovereign States or powers.

Measures of Weight.—The largest measure for brandy, wine, and other liquors, is the jarva, which contains 18 cuartillos, of 1 pound, or 16 ounces of distilled water at the temperature of its greatest density. Brandy barrels are distinguished into medidos and

redouos. The former contain 262 cuartillos, and the latter 160. The redouo barrel of wine contains 150 cuartillos. Oil is bought and sold at wholesale by weight; but at retail a particular cuartillo is used, containing 17 ounces and 9 drachms of distilled water. For olive oil the same cuartillo is used as for brandy, wines, etc. At the mines the marco is used for gold and silver. The gold marco is divided into 50 castillanos, of 8 tomines of 12 grains. The silver marco has 8 echoods, of 6 tomines of 12 grains. Assayers, to determine the purity of these two metals, use the same marco. For gold, the castellano is divided into 24 quilates, of 4 granos de ley, each grano equivalent to 50 in weight. For silver, the marco is divided into 12 dineros of 24 granos de ley, each grano being equivalent to 16 in weight. Lapidaries, for the assay of precious stones, use the quilate, which is the tenth of an ounce. Apothecaries use the libra medicinal, which is divided into 12 common ounces of eight drachms, of 3 scruples, of 24 granos.

Money in Circulation.—Baron Humboldt calculated, in 1803, the value of the money accumulated in Mexico to be \$55,000,000 or \$56,000,000; which sum compared with the population then existing in New Spain, corresponded in proportion to \$10 for each inhabitant. Taking this calculation for a basis, and considering the prosperity in mining from that time to this, there is no hazard in saying that the value of the money now in the republic, notwithstanding the great exportation past and present, amounts to \$90,000,000 or \$100,000,000. Although this sum is, doubtless, sufficient for all the operations of the interior trade, which is very small, as well in agriculture as in manufactures and commerce, the circumstance of the greater part being confined to a few hands on the one side, and on the other the want of confidence, causes the frequent scarcity of the money in circulation, causing the rare phenomena of a country which produces gold and silver so abundantly, paying a higher interest on money than in countries not yielding it.

The geographical position of the States and Territories of Mexico is thus defined: 1. *Eastern or Gulf Coast.*—The States of Yucatan, Chiapas, Tabasco, Vera Cruz, and Tamaulipas. 2. *Western or Pacific Coast.*—The States of Oajaca, Puebla, and Territory of Tlascala; State of Mexico, and Federal District; States of Michoacan, Jalisco, and Territory of Colima; States of Sinaloa, Sonora, Guerrero, and Territory of Lower California. 3. *Interior.*—The States of Queretaro, Guanajuato, Zacatecas, San Luis Potosi, New Leon, Coahuila, Durango, and Chihuahua.

Yucatan.—The State of Yucatan occupies the greater portion of the peninsula which bounds the southern edge of the Gulf of Mexico. It comprises an area of about 52,947 square miles, and contains a population of 680,948.

The principal productions of Yucatan are maize, cotton, rice, tobacco, pepper, sugar-cane, dye-woods, hides, and soap. Foreign trade with Yucatan is distributed between the United States, France, England, Spain, and other countries. The proportions may be estimated from the following table, showing the value of imports into Yucatan during the year 1850, from each of the countries above designated: Spain, 1,950,000 francs; England, 1,400,000 francs; United States, 1,000,000 francs; France, 225,000 francs; other countries, 925,000 francs; total, 5,500,000 francs, or \$1,023,000.

The principal ports in Yucatan are Campeche and Sisal, both open to foreign commerce. In the former, the water is so shallow that vessels are obliged to anchor some considerable distance from the town of Campeche, and discharge and take in cargoes by means of lighters and canoes. Sisal possesses a deeper port than Campeche, but it is more exposed to the north winds, which prevail in the Gulf of Mexico from October to April. It is the dépôt for the import

and export trade of Merida, the capital of Yucatan, and for all merchandise transported to or from the interior of the State. Campeche attained, under the ancient rule, a high degree of commercial prosperity. It enjoyed a monopoly of all the imports and exports of the province; but since the independence of Mexico, its commerce has declined—a result brought about by the opening of other ports to general trade, as well as by its difficulties with the central government, and the fearful ravages of epidemics, by which, in one year, fully two fifths of its population were carried off.

Chiapas.—The State of Chiapas possesses but little commercial interest. It was incorporated into the territory of Mexico in 1833, forming, before that year, a portion of the territory of Guatemala. Its productions are corn, cocoa, sugar, tobacco, indigo (of the very finest quality, but in small quantities), tropical fruits, and timber of almost every variety. Like Yucatan, this State derives its chief interest from the ancient remains of a former advanced civilization within its territories, bearing date long anterior to the Spanish conquest. The ruins of Palenque, in Chiapas, and of Uxmal and Chichen, in Yucatan, are, perhaps, the most wonderful of all that have been discovered hitherto on the western continent.

Tabasco.—Tabasco, the smallest State of the confederacy, was, previous to the revolution, a province belonging to the intendency of Vera Cruz. Its principal productions are cocoa, coffee, pepper, sugar, tamarinds, arrow-root, palmetto, and some tobacco. Its capital, Villa de San Juan Bautista, lies about 70 miles from the Gulf, and is reached by vessels of light draught. Its commerce is chiefly carried on with the adjoining States and with Guatemala.

Vera Cruz.—The State of Vera Cruz lies under the burning sky of the tropics, and is comprised within a long, but somewhat narrow, strip of territory along the Gulf of Mexico, running from the mouth of the Tampico River in the north, to the Guasacualco and the boundaries of Tabasco on the south. It contains an area of 3199.50 square leagues, and a population of 264,725* inhabitants. The port of Vera Cruz lies in 19° 11' 52" N. lat., and 98° 29' 19" W. long. from Paris, on a sandy plain, interspersed with marshes, which bound the Gulf of Mexico. From the month of May to that of November, the usual period during which the northers cease blowing, the unhealthiness of Vera Cruz is proverbial. The principal productions of the State of Vera Cruz are tobacco, coffee, sugar, cotton, corn, barley, wheat, jalap, sarsaparilla, vanilla, mahogany, ebony, dye-woods, and every variety of tropical fruit. The port of Vera Cruz supplies a great part of the republic, and is considered by far the most important shipping point on either coast. Foreign vessels are allowed to introduce goods and effects from foreign countries only, and they are permitted to enter but one port for discharge; they may then proceed, in ballast, to any other port in the republic for the purpose of taking in cargoes of the produce of the country. During the year 1852 there arrived at the port of Vera Cruz, from all foreign countries, 173 vessels, with an aggregate of 21,958.23 tons. The total value of merchandise exported, including gold and silver, was \$10,449,070 05. Of the vessels named, there were 49 American, measuring 6284.15 tons. The character or value of their inward cargoes is not given in the United States' consular returns, but the import duties are stated to have amounted to \$159,301 20. Amount of silver exported, \$853,287; of gold, \$55,884; other products, \$205,150; total value of homeward cargoes, \$614,322.

During the same year there arrived from Great Britain 38 vessels, with an aggregate of 2655.22 tons. Total amount of exports, \$9,175,763 82, of which silver

* A census taken in 1854 raises this number to 274,686.

covered \$8,565,859 32, and gold \$47,952. France holds the next rank in the trade of Vera Cruz. The number of French vessels arrived in 1852 was 28, of 5717 tons. Inward cargoes not ascertained. Outward, total value \$421,935; of which, silver \$118,921, gold \$45,554. Number of Spanish vessels arrived at Vera Cruz during the year 1852, 26, with an aggregate of 8211.67 tons. Total value of cargoes exported \$141,287, chiefly silver and gold. The residue of the foreign trade of this port, during the same year, was distributed between 82 vessels, with an aggregate of 4189 tons, carrying, respectively, the Belgian, Danish, Hanoverian, Mexican, Portuguese, Sardinian, and Venezuelan flags. From Hamburg there were 8 vessels, exporting a total value of \$23,196.

During the prevalence of the northers, the port of Vera Cruz is considered to be very unsafe. In 1846 the United States' brig-of-war *Somers* was lost in sight of the city, making the third United States' national vessel lost during that season, in the Gulf of Mexico. A norther generally continues two or three days. "It comes on," says a publication elicited by the loss of the *Somers*, "gradually, so that the mariner who is unaccustomed to navigate the Gulf of Mexico is often unsuspecting of danger, and flatters himself with the idea that the 'stiff breeze' which impels his vessel onward will soon carry her to her port of destination. And so it does, but not in safety; for the 'stiff breeze' freshens into a gale, and the gale into a hurricane; and, at length, the vessel strikes on one of the rocks with which the harbor of Vera Cruz is studded. In that harbor the anchorage ground is, perhaps, the worst in the world. At Vera Cruz no number of anchors hardly will keep a vessel from going ashore in a norther. All that the captain of a vessel can do, under such circumstances, is to slip his anchors and stand out to sea immediately. Vessels of war, even those belonging to friendly powers, are not allowed by the Mexican government to enter the harbor of Vera Cruz. They always anchor at Sacrificios, a barren island at the entrance of the harbor. At Sacrificios the anchorage is pretty good. Mexican men-of-war, when there are any such in the harbor of Vera Cruz, are always moored to rings set in the walls of the castle of St. Juan de Ulloa, and, by that means, are secured from the effects of a norther." The official account of the loss of the *Somers*, bearing date December 12, 1846, is on file in the Navy Department, and contains many valuable suggestions relative to the dangers to which navigation is exposed in the Gulf of Mexico.

Tamaulipas.—This State is bounded north by the State of Texas; north-west by the Mexican State of Coahuila; on the west by the States of New Leon, San Luis Potosi, and Vera Cruz; and on the east by the Gulf of Mexico. In breadth it varies from 12 to 55 leagues. This State has more than 350 miles in length of sea-coast, and is fringed with lagoons varying from 4 to 18 miles in width, divided from the gulf by a bank of sand. The shallowness of the shores along the coast, and the dangerous bars which choke the mouth of the rivers, render the navigation difficult and dangerous for vessels of almost all classes. Population in 1850, 110,074; though the census of 1854 gives but 100,064. The chief productions of this State are similar to those found in the State of Vera Cruz. The coasting and foreign trade is conducted principally in the ports of Tampico de Tamaulipas and Matamoras. From these places large quantities of European and North American manufactures enter the middle and northern States of the republic. Queretaro, San Luis, Nuevo Leon, Coahuila, Zacatecas, Jalisco, Durango, Chihuahua, and Sonora, receive most of their foreign supplies from these points. Tampico de Tamaulipas, on the northern bank of the Panuco, is the principal commercial port of this State. Its bar is dangerous, and its harbor considered unsafe. The town is situated

in the midst of extensive marshes, and can not be approached by large vessels. Its foreign commerce is represented as increasing (vide *MAYER's Mexico*, vol. ii., p. 206), though a consular return from that port, bearing date February 17, 1854, says that the trade with the United States is on the decrease, owing to "high rates of duties, both impost and consumption; as also circulation and municipal."

Tampico exports hides, sarsaparilla, goat-skins, fustic, vanilla, wool, jerked beef, and Mexican hemp. Tampico is the outlet of the metals and other productions of San Luis Potosi, Guanajuato, Zacatecas, and Durango, considered to be the richest mining districts in Mexico. The foreign trade of Tampico during the year ending December 31, 1852, was as follows: Total value of inward cargoes, \$1,228,948; total value of outward cargoes, \$3,266,634; total foreign trade, \$4,495,582.

Total number of American vessels included in the above, 22, with an aggregate of 2267 tons. Value of inward cargoes, \$196,936; value of outward cargoes, \$237,944; total trade in American vessels, \$434,880. Total number of British vessels, 17; aggregate tonnage not ascertained. Of these, 14 belonged to the British Royal Mail Steamship Company, and 3 were sailing vessels. Total value of inward cargoes (exclusive of 1000 flasks of quicksilver, value not ascertained), \$237,500; total value of outward cargoes, \$2,928,418; total trade in British vessels, \$3,215,918. Total number of French vessels, 9, of 1,315 tons. Total value of inward cargoes, \$398,000; total value of outward cargoes, \$2080; total trade in French vessels, \$400,080. Total number of Spanish vessels, 7, of 728 tons. Total value of inward cargoes, \$139,300; total value of outward cargoes, \$50,176; total value of trade in Spanish vessels, \$189,476.

The residue of the trade at the port of Tampico, during 1852, was distributed between Sardinia, Hamburg, Holland, and Mexico. Matamoras lies on the right bank of the Rio Grande, or Rio Bravo del Norte, at the distance of nearly 30 miles from its mouth. For purposes of navigation, this river is, perhaps, the most important in Mexico, and has proved navigable by steamers for a considerable distance into the interior. Recent returns from this port are not at hand, but the general trade of Matamoras is not of much importance. The following facts relative to its trade are derived from French official returns: Imports into the port of Matamoras consist chiefly of breadstuffs, spices, provisions, and cloths, from New Orleans; exports, of specie, hides, and wool. In 1844 there entered 33 vessels, of 2054 tons, floating inward cargoes of the value of 1,633,000 francs; and outward about an equal amount. Two thirds of all commercial operations at this port are under the American flag. In 1841 commercial movements with the United States reached the sum of 23,000,000 francs—12,000,000 for inward, and 11,000,000 for outward cargoes. Of the imports, British merchandise imported in American bottoms reached 5,000,000, while American produce and manufactures amounted to only 2,500,000. French merchandise in American bottoms figured as high as 1,300,000 francs, and German 1,080,000. Cotton cloths (mostly British) reached, in this trade, 5,136,000 francs. The export trade to the United States during this year covered 9,000,000 francs in specie, and over 2,000,000 in hides.

Chihuahua.—The principal port in this State is El Paso del Norte, lying on the right bank of the Rio Grande. "The position of this town is an important one, inasmuch as the road by it is the only practicable one for wagons leading from Santa Fé to Chihuahua." —*MAYER's Mexico*. The valley of El Paso is the most fertile in Mexico, producing maize, wheat, and almost every variety of fruits. The commerce of the United States with this port has decreased since 1851, not half the amount of merchandise having been imported from

the United States in 1852 as in 1850 and in 1851. This decline is attributed to the failure of the crops in the State of Chihuahua, and the high duties, which amount almost to a prohibition. Mexican and foreign merchants send to the United States wine and brandy, manufactured in the El Paso valley, and sugar, soap, rebosas, saddles, bridles, leather, segars, mats, and fruits, amounting annually to about \$70,000.

Oajaca.—This State has a sea-coast on the Pacific extending 118 leagues, and comprises an area of about 4150 square leagues, containing a population of 525,101 inhabitants. The fertility of soil and richness of productions render this State, in a commercial aspect, one of the most important in Mexico. There is not, however, any port open to foreign commerce on this part of the Pacific, from the boundary line of Guatemala to Acapulco, a distance of nearly 900 miles. The coasting trade is nearly nominal, although the State possesses nine sea-ports or anchorages, namely: Tehuantepec, Huatulco, Escandido, Chachahua, and Jamiltepec. Corn, cotton, coffee, sugar, cocoa, vanilla, tobacco, cochineal, wax, honey, and indigo, are the staple productions. The indigo crop, produced in the department of Tehuantepec, is estimated at 500 garrones, of 175 pounds each, and that in the valley of Sonola at 600 garrones, making the whole crop of indigo equal to 192,500 pounds. The price paid to planters is 62½ cents to \$1 per pound. From a message of the Governor of Oajaca to the National Congress, it appears that, during the 17 months previous to March 1, 1854, the crop of cochineal produced in the State of Oajaca reached as high as 1,248,550 pounds. The price usually ranges from 50 cents to 75 cents per lb., according to quality. This State possesses, also, considerable mineral wealth. There are, at present, silver mines worked, 4; not worked, 3; gold mines worked, 5; lead mines, 1. Annual product of all the mines, \$352,000; annual products of iron mines, 244,000 pounds. On both sides of the Isthmus of Tehuantepec great quantities of mahogany and other cabinet woods, gums, etc., are produced. The cocoa raised in some parts of this State is of so superior a quality,

that, while the country belonged to Spain, it was reserved for the royal family. It still has a deserved reputation.

Guerrero.—This State comprises the districts of Acapulco, Chilapa, Tasco, and Tlapa, and the municipality of Coyucan. Its principal port is Acapulco, so spacious and secure that 500 vessels can lie at anchor in it with perfect safety. The trade of Acapulco is inconsiderable; the foreign vessels entering the port being either freighted with coals for the Pacific Mail Steamship Company, or in distress—the former being compelled to clear in ballast. By decree dated February 4, 1854, the Supreme Government made a reduction in the tonnage dues upon all vessels arriving in that port laden with coal, and consigned to any steamboat company having a dépôt of coals in the harbor, viz.: 50 cents per ton, instead of \$1 50, as formerly. During the year 1853, there entered the port of Acapulco 81 American steamships, of 107,007 tons; 8 sailing vessels (ships) carrying 4,369 tons; 1 bark, and 2 schooners. Besides Acapulco, there are other ports on the Pacific coast open to foreign trade; but the Department is not in possession of information respecting them. They possess, however, no commercial importance. The other States of Mexico, being either in the interior of the republic, or possessing no ports open to foreign commerce, are not deemed of sufficient commercial consideration to demand separate notice. Returning to the general commerce of Mexico with foreign nations, particularly with the United States, it is found that the principal articles of importation from the latter to that country are, machinery, articles of iron, small wares, linen, woolen, and cotton cloths; silks, flour (when not prohibited), raw cotton, timber for the construction of houses, prepared medicines, household furniture, vehicles, harnesses, horses, salt meats, sperm, paper, marble and other stone.

The imports into the United States from Mexico consist, principally, of gold, silver, dyewoods, dyestuffs, hides, skins of sheep, cattle, and other productions of less value. The following statement shows a decrease in the importance of our commerce.

COMMERCE OF THE UNITED STATES WITH MEXICO, FROM OCTOBER 1, 1824, TO JULY 1, 1856.

Years ending	Exports.			Imports.	Whereof there was in Bullion and Specie.		Tonnage Cleared.

This exhibit may be relied upon, having been made up from official reports on "Commerce and Navigation." It will be perceived that the commerce between the two countries decreased during the 30 years embraced in the above table. In 1854 it experienced considerable activity, exceeding in value the totals of 1850, but not reaching those of 1840, and still further below those of 1830. The value of imports in 1854, as already given, was \$3,463,190; and of exports, \$3,135,486; making a total of \$6,598,676—being \$91,666 less than for the year 1840, and \$3,474,023 less than for 1830. The importations from Great Britain into Mexico may be illustrated from a report made by order of Parliament. For a period of seven years, from 1840 to 1846, both included, the sum total of the value of the imports was \$82,246,705, making an average value of nearly \$12,000,000 per annum. The principal articles of import were as follows: drugs, haberdashery, and wearing apparel, arms and ammunition, malt liquors, printed books, manufactures of brass and copper, furniture, carriages, coals, cordage, manufactures of cotton, earthenware of all kinds, glass wares, hardware and cutlery, hats, iron and steel in bars, manufactured lead, prepared skins, harnesses and saddles, manufactures of flax, machinery and machines, and musical instruments. Of these articles, the manufactures of cotton rank highest; the estimated value of the importation for the seven years amounting to more than \$57,000,000, while that of manufactures of linen (which comes next in order of value) was more than \$12,000,000, leaving only some \$12,000,000 or \$13,000,000 as the aggregate value of all the other imports from Great Britain into Mexico. The character and value of merchandise entering into the commercial movement of Mexico with France may be exemplified by those of the year 1851, as exhibited from the data furnished by the official returns of France. The reason of the shipments thither of the precious metals being in so small amounts, is, that the exchange with England can always be more conveniently arranged than with that country.

The importation to Mexico from Germany consists principally of linen textures, such as Silesian linen, creas, etc., etc.; to which are added, in smaller quantities, some chintzes, muslins, silk handkerchiefs, cloths, cassimeres, crystals, plain glass, fine and common hardware, arms, carriages, furniture, and pianos.

The quantities of linen exported from Hamburg and Bremen to Vera Cruz and Tampico, during the years designated, were as follows:

The foregoing is exclusive of city and hospital contributions, and *internacion*, or internal duty, levied upon the same goods when dispatched to the interior.

The commerce of Mexico is confined to the reception of foreign goods sufficient for the necessities or luxury of a very small class of the population, for which is given in exchange a large portion of the products of the mines, and some few products of the soil. As the yield of the mines is estimated only at \$26,000,000 annually, the amount of commerce can not much exceed that sum. The total number of Mexican merchant vessels, all of which are small, does not exceed 50, and of these more than half belong to the merchants of Yucatan.

The following account of the trade and commerce of the republic for the year 1851-52 is compiled from the official returns:

Ports.	Total.	Passengers.	
	Tonnage.	Arrived.	Departed.
Vera Cruz.....	28,203	1,429	1,346
Tampico.....	7,704	178	126
Campeachy.....	6,992	4,975	1
Sisal.....	4,239	43	95
Tabasco.....	3,730	51	21
Acapulco.....	181,530	31,242	23,540
Manzanilla.....	1,402	11	..
San Blas.....	30,321	4,863	4,200
Mazatlan.....	30,762	5,095	5,000
Altata.....	1,153	81	9
Guayamas.....	4,335	718	85
Total.....	256,692	43,516	40,153

Of the vessels arriving, 68 belonged to Mexico, 435 to the United States, 103 to England, 69 to France, 60 to Spain, 13 to Hamburg, 24 to Peru, 5 to Belgium, 8 to Bremen, and 1 each to Portugal, Nicaragua, Sweden, Hanover, and Venezuela.

Among the arrivals were 219 steamers, viz., 145 at Acapulco, 7 at Vera Cruz, 4 at Tampico, 27 at San Blas, 35 at Mazatlan, and 1 at Guayamas. Of these, 145 were United States' vessels.

Of the classes of vessels, beside steamers, there were 55 frigates (vessels of war), 114 barks, 165 brigs, 63 hermaphrodite brigs, 155 schooners, and 63 pilot boats.

The chief coasting trade of the republic, on the Gulf of Mexico, is performed by schooners between Tampico, Tuspan, Sisal, Campeche, Tabasco, Minatitlan, Alvarado, and Tlacotalpan. For this trade, a few vessels exist of about a hundred tons burden, built at Campeche, and are equal to American vessels of like quality in respect to capacity, sailing properties, and durability. National vessels make voyages only to the ports of New Orleans and Cuba; and in the year 1852 only seven sail were thus employed, and the amount of coasting in the same time was very small. There appears to be no increase in this trade, nor in the building of vessels. The commerce with foreign

countries is reported recently to have decreased; and with the United States, in particular, to be on the decline. The cause of this change is considered to be the high rates of duties, both on imports and exports, and the additional charges, local as well as internal. It is known that the late President of Mexico (Santa Anna), a short time before his abdication, had granted privileges and special concessions to certain European houses for the introduction of foreign merchandise on the Pacific coast, at from 25 to 30 per cent. less than the regular impost by the established tariff. As this involved a palpable violation of the treaty between the United States and Mexico, the American minister to that country, under date of April 10, 1855, protested against such privileges and special concessions. Under such a system, American merchants were reduced to the necessity of witnessing the products of the United States contributing to the fortunes of European merchants; while they were denied the right, notwithstanding treaty stipulations, of importing similar merchandise on the same terms, under a penalty of confiscation, and a fine to the extent of the market value of the cargoes at the place of importation.

The Principal Ports are Acapulco, lat. $16^{\circ} 50' 30''$ north, long. $90^{\circ} 46'$ west, the best sea-port on the western coast of Mexico, and is capable of containing a large navy with perfect safety. Tampico, a considerable commercial port on the eastern coast of Mexico, in lat. $22^{\circ} 15' 30''$ north, long. $97^{\circ} 52'$ west. The shifting of the bar at the mouth of the river, and the shallowness of the water on it, which is sometimes under 8 feet and rarely above 15 feet, are serious obstacles to the growth of the port. Vessels that can not enter the port, load and unload by means of lighters, mooring outside the bar, so that in event of a gale from the north, they can readily get to sea. Vera Cruz, the principal sea-port on the eastern coast of Mexico, lat. $19^{\circ} 11' 52''$ north, long. $96^{\circ} 8' 45''$ west. The harbor lies between the town and the island of San Juan de Ulloa, about 2400 feet wide; it is insecure, the anchorage being very bad, and no vessel is safe unless made fast to iron rings fixed into the wall of the castle on the island, and even then accidents sometimes occur. Guaymas, a sea-port town of Sonora, on the Gulf of California, at the mouth of a considerable river, lat. $27^{\circ} 55'$ north, long. $110^{\circ} 16'$ west. It is neither large nor well built, but its harbor is the best on the western coast of Mexico, and it has an active and increasing trade.

New Ports Open for Foreign Trade.—Guaymas, Camargo, Mier, Piedras-negras, Monterey, Laredo, Tonala, Zapaluta, Guatzacoalcos, La Ventosa.

Tonnage Duties and Port Charges at Vera Cruz.—On foreign ships and national vessels from foreign ports, per ton (the Mexican ton is 12 per cent. less than that of the United States), \$1 50; fees of captain of the port, \$3 50; water dues (Mexican vessels in the coasting trade pay $6\frac{1}{2}$ cents per ton, as water tax, but are exempt from tonnage duty), 12 $\frac{1}{2}$ cents; stamped paper

for entering and clearing, \$8 50; pilotage, either way, per foot, \$2 50; pilot-boat, with four or six oars, \$8; bills of health, if required, \$4; to consul of country where destined, \$4; visit of health officer, \$2. Wharfage and municipal dues are very insignificant. The moneys, weights, and measures, in use in Mexico, are the same as those of Spain. At the port of Tampico, the dues and charges are quite the same as at Vera Cruz. Hospital dues at the former port are \$10.

Tariff Regulations.—The tariff regulations of Mexico have been subject to frequent changes of late. The rates established by the tariffs of 1845, 1855, and 1856, will be found in the *Comparative Tariffs* issued by the State Department, Part II. The details of the tariff of January 31, 1856, are as follows:

Charges on Vessels.—Tonnage, \$1 per ton; free of tonnage, if in ballast to load logwood, specie, etc.; or if bringing coal for the Mexican deposits; or if only bringing passengers or mails.

Prohibitions.—Brandy, of sugar-cane; and all other except that made out of grape—excepting gin, rum, and others named in the tariff, in bottles, or jars; sugars, of all kinds; rice; buttons, with the Mexican or foreign arms; coffee; wax, made up in candles; obscene pamphlets, books, etc.; flour of wheat, except at Acapulco, Yucatan, Tampico, Matamoros, and the custom-houses of the northern frontier. For regulations, see *Comparative Tariffs*, Part II. Boots, shoes, slippers of leather with soles; rein-bits and spurs of Mexican fashion; books prohibited by competent authority; lard, subject to the same exceptions (omitting Acapulco) as flour; saddles, and appurtenances of Mexican fashion; playing-cards, of Mexican fashion; scarfs, Mexican fashion, of all kinds; speckled or printed textures imitating the same; wheat, and all kinds of grain and seeds; blankets, woolen or cotton, or mixed, excepting coverlets and bed-coverings of piqué, without seams.

Additional Duty to Tariff.—1. Municipal duty will be 12 $\frac{1}{2}$ cents on each package of 8 arrobas weight, payable at the time of importation. 2. For improvement of the country, 20 per cent. on the import duty. 3. International duty, 10 per cent. on importation duty, payable at the time of sending the goods to the interior. 4. *Contra registro*, is 20 per cent. on import, payable at the final place where goods are sent. 5. Amortization duty of the public debt liquidated and consolidated: this duty will be 25 per cent. on the import duty, and be payable in full at the General Treasury Department of the nation, with bonds of the public debt liquidated and consolidated.

Export Duty.—On coin and wrought gold, 1 $\frac{1}{2}$ per cent.; on coined silver, $3\frac{1}{4}$ per cent.; on silver bars, stamped by mint, 7 per cent. All the remaining goods, products, and national manufactures, not specified, may be exported without paying any duty.

All laws, decrees, circulars and orders, which are in conflict with this tariff, directly or indirectly, will cease immediately after publication of the present new one.

PRO FORMA INVOICE UNDER NEW TARIFF OF JANUARY 31ST, 1856.

Invoice of the following goods shipped by the subscriber for Captain to the consignment of merchants of the port of Vera Cruz (Mexico), whether this vessel is bound.

Marks.	Numbers.	Number of packages.	Gross weight of each.	Description of packages.	Total net weight of each which pay by weight.	Total measurement by length of goods which pay by measurement.	Width of goods exceeding one vara.*	Class of goods specified.	Value.
P. M. R.	1 to 10.	10 (ten).	1 (one) quintal.	Bales of common size.	100,000 (one hundred thousand) yards.	1 (one) yard.	White ordinary cotton.

New York, (date.)

(Signature).

* 100 yards English are equal to 109 11-100 Mexican.

In this manner all invoices are to be made out, specifying every one of its packages. The total number of packages to be specified in words also.—*Com. Relations, U. S.*

Michigan, a north-western State of the republic, lies between lat. $41^{\circ} 43'$ and 48° north, and between $82^{\circ} 25'$ and $90^{\circ} 34'$ west from Greenwich, or $5^{\circ} 24'$ and $18^{\circ} 33'$ west from Washington. It consists of

two peninsulas, and contains 56,243 square miles. Population in 1810, was 4528; in 1820, 9448; in 1830, 31,639; in 1840, 212,276; and in 1850, 397,654.

Physical Features, etc.—The surface of the lower, or southern peninsula is generally level, having few elevations which may be denominated hills. The interior is gently undulating, rising gradually from the lakes to the centre of the peninsula. This central region may be regarded as a table land, elevated about 300 feet above the level of the lakes, covered with fine forests of timber, oak plains, and prairies. Along the eastern shore of Lake Michigan are sand-hills, thrown up by the winds into fantastic forms generally quite barren and naked. The part lying between Lake Huron and Saginaw Bay is low and swampy. No part of the United States is better supplied with fish, aquatic fowl and game.

There were, in this State, in 1850, 1,929,110 acres of land improved; and 2,454,780 acres of unimproved in farms; cash value of farms, \$51,872,446, and the value of implements and machinery, \$2,891,371. Live stock—horses, 58,506; asses and mules, 70; milch cows, 99,676; working oxen, 55,350; other cattle, 119,471; sheep, 746,435; swine, 205,847; value of live stock, \$8,008,734.

Agricultural Products, etc.—Wheat, 4,925,888 bushels; rye, 105,871; Indian corn, 5,641,420; oats, 2,866,056; barley, 75,249; buckwheat, 472,917; peas and beans, 74,254; potatoes, 2,359,897; sweet potatoes, 1177; value of products of the orchard, \$132,650; produce of market gardens, \$14,738; pounds of butter made 7,065,878; of cheese, 1,011,492; maple sugar, 2,439,794; molasses, 19,823 gallons; beeswax and honey, 359,232; wool, pounds produced, 2,043,283; flax, 7152; silk cocoons, 108; hops, 10,663 pounds; of tobacco, 1245; hay, tons of, 404,934; clover seeds, 16,989 bushels; other grass seeds, 9285; flax seed, 519 bushels; and were made, 1654 gallons of wine; value of home-made manufactures \$340,947; of slaughtered animals \$1,328,327.

Of the northern peninsula, Mr. Schoolcraft says:—"Portions of it are the mere development of sublime scenery which pertains to that comparatively elevated portion of the continent. Mountains and lakes, plains, rivers, and forests, spread over it with a boldness of outline which may be said to constitute almost a peculiar type of North American Geography. This division embraces the mineral region. It is of little value for the uses of agriculture. The interior abounds in small lakes. On the shore of Lake Superior are several large bays and good harbors. Recent explorations here have discovered immense deposits of rich copper ore; on the southern shore of Lake Superior is a series of lofty bluffs and isolated rocks, having the appearance of ruins, tottering walls, and caverns. *La Chapelle*, or the Arched Rock, is a beautiful specimen of this character, as are the Pictured Rocks, etc. There are also several picturesque cascades."

The southern peninsula of Michigan is drained by several large rivers and numerous smaller streams, which, rising in the interior, pass off in easterly, westerly, and northerly directions into the lakes. Raisin and Huron Rivers flow into Lake Erie, Rouge River into Detroit Strait, Clinton and Black Rivers into the Strait of St. Clair, Saginaw River formed by the junction of Titibawassee, Flint, and Cass Rivers enters Saginaw Bay. Thunder Bay, Cheboigan River, and some smaller streams fall into Lake Huron. St. Joseph, Grand, Kalamazoo, and Muskegon Rivers flow into Lake Michigan. Many small lakes of pure water, stocked with fish of fine quality, are found in the interior. This State borders on four of the great lakes, viz., Erie, Huron, Michigan, and Superior. The principal rivers of the upper peninsula are Ontonagon, Huron, Menomonee, Montreal, St. Mary, Eagle, Cedar, White Fish, Black, Sturgeon, Rapid, and Manistie. The principal islands are Drummond, Sugar, St.

Joseph, Bois Blanc, Mackinaw, Manitou, and Beaver Island, in Lakes Huron and Michigan; Isle Royale and the Apostles, in Lake Superior.

Manufactures, etc.—There were in this State in 1850, 15 woolen factories, with a capital of \$94,000, employing 78 males and 51 females, manufacturing 141,570 yards of cloth, valued at \$90,242; 1 establishment making pig iron, with a capital of \$15,000, employing 25 persons, producing 660 tons of pig iron, etc., valued at \$21,000; 63 establishments with a capital of \$195,450, employing 337 persons, and making 2070 tons of castings, etc., valued at \$279,697; 231 flouring and grist mills, 477 saw mills, 45 tanneries; 57 printing offices, 58 newspapers, 3 daily, 2 semi-weekly, 47 weekly, 2 semi-monthly, and 3 monthly publications. Aggregate number of copies published, 3,247,736. Capital invested in manufactures, \$5,764,645; value of manufactured articles, \$10,407,285. There were, January, 1856, 590 miles of railroad in operation.

The principal places in the State are Detroit, the metropolis, Monroe, Ann Arbor, Ypsilanti, Adrian, Jackson, Marshall, Kalamazoo, Lansing, the capital, St. Josephs, Mackinac, Grand Haven, and Sault St. Marie. There were in 1854, 6 banks and 1 branch, with an aggregate capital of \$1,084,718. Exports (1852) in American vessels, of domestic produce, to the value of \$100,436; in foreign vessels, \$31,930; of foreign produce in American vessels, \$4338; in foreign vessels, \$8448. Total value, \$145,142. Imports in American vessels, \$191,976; foreign vessels, \$4264. Total value, \$196,240. Tonnage, 1853, 4,591,284.

The shipments from Detroit were as follows:

	1854.	1855.
Flour.....bbls.	337,143	640,393
Wheat.....bush.	397,159	737,890
Indian corn....."	557,439	629,395

White Fish.—One of the largest and most important items in the commerce of Detroit, is the trade in white fish. From the head of Lake Erie to the head of Lake Superior, including Lake Michigan, during the fall and spring months, the fisheries form an important branch of our western commerce. But probably there is no place of the same area along our lakes and rivers which is so valuable in this particular, as the river contiguous to this city. From Fighting Island, to the northern point of Belle Isle, a distance of 17 miles, there is one complete fishery, from which large numbers of fish are yearly taken. The cost of taking them, when the run is fine, is very light, and fishermen realize large profits. They are known through all the States, and are esteemed among the choicest delicacies to be had in any market. The large demand creates a corresponding valuation, and in every city they have become the first brand of fish sought. The river fish are generally larger, fatter, and better flavored than those of the lakes, and are, therefore, always in greater demand, and always command better prices. In New York, Boston, New Orleans, and even San Francisco, the Detroit River white fish are eagerly sought for.

The season of 1855 was a remarkably good one. At the fisheries (about 50 in number), between Fighting Island and Belle Isle, over 7000 barrels, or some 700,000 fish, have been taken. About half of these have been sold fresh, at an average of 11 cents each, bringing in a revenue of \$3850. The remaining portions are mostly held by the fishermen until navigation shall open to them the southern and eastern trade. These 3500 barrels, when sold, will nett the holders about \$30,000, or in the neighborhood of \$8 or \$9 per barrel. From the fisheries upon Belle Isle about 7000 fish were taken, a majority of which were sold fresh. The remainder of them were caught below the city, mostly upon the American side of the river.

The method of catching fish here in the river differs somewhat from the means adopted for lake fishing. There gill-nets are the principal agency employed, while seines are the instruments here used.

The number of barrels caught annually in the lake fisheries is nearly as follows:

Lake Superior.....	Bbls. 8,000	Lake Erie.....	Bbls. 8,000
Lake Michigan.....	15,000	Detroit River.....	7,000
Lake Huron.....	14,000	Total.....	42,000

These are sold at an average price of \$11 per barrel, the aggregate amount of sales being \$462,000, or nearly \$500,000. Probably one sixth of all the fish caught in Lakes Michigan, Huron, and Superior, are trout; the remainder being white fish. They are commonly caught by gill-nets, set some 10 miles distant from the shore. Large quantities of the fish are taken from the Detroit River, which they ascend from Lake Erie to spawn. On their return to the lake they are captured. The number of fisheries in the river is 50.

In some of the rivers that flow into the lakes, enor-

mous quantities of pickerel are caught. Not less than 1000 barrels are taken annually from Fox River, Wisconsin; from Saginaw River, Michigan, 1500 barrels; St. Clair River, Michigan, 1500; Maumee River, Ohio, 8000 barrels, and an equal quantity of bass, mullet, etc., making a total of 10,000 barrels, which are sold for \$8 50 per barrel, or \$85,000 in the aggregate. The annual product of the lakes and tributary rivers is thus shown:

	Bbls.	Value.
The Lakes.....	25,000	\$385,000
Detroit River.....	7,000	77,000
Other rivers.....	10,000	85,000
Total.....	52,000	\$547,000

See HUNT'S *Mag.*, vi., 333, xix., 19 (J. R. WILLIAMS), xxii., 131.

The principal port is Detroit, a large and flourishing city on the Detroit River, opposite Windsor, the terminus of the Great Western (Canada) Railroad, which here connects by ferry with the Michigan Central Railroad, together forming a convenient line between Niagara and Chicago. It is also the south-western terminus of the Detroit and Milwaukee Railroad; and a line (the Detroit and Toledo Railroad) is now in progress to connect with the railroads centering at Toledo. It has one of the finest harbors in the United States, and is admirably adapted for commerce. It has also extensive manufactures, chiefly machinery, agricultural implements, etc., and a large trade in lumber. On the whole, it is a most flourishing place, and ranks as the first city of the State. Population in 1855, 50,448. Detroit was founded in 1760 by the French, and was for many years the State capital. Twenty-five years ago it had only 2000 inhabitants. The tonnage of Detroit in 1856 was 58,688 tons.

Port Huron.—A town at the mouth of Black River, on the St. Clair, and two miles south of Lake Huron. It has a large lumber business and fine general trade.

Microscopes. Invented nearly at the same time in Italy and Holland, A. D. 1621. Those with double glasses were made at the period when the law of refraction was discovered, about 1624. The honor of this invention is awarded to Drebel and Torricelli. Solar microscopes were invented by Dr. Hooke. In England, great improvements were made in the microscope by Henry Baker, F.R.S., who wrote two treatises upon it about 1763.—*Biog. Dict.*

Mile (Lat. *mille passuum*, a thousand paces). The Roman pace being five feet, and a Roman foot being equal to 11-62 modern English inches, it follows that the ancient Roman mile was equivalent to 1614 English yards, or very nearly 11-12ths of an English statute mile. The English statute mile was defined (incidentally, it would seem) by an act passed in the 35th year of the reign of Queen Elizabeth, by which persons were forbidden to build within three *miles* of London; and the mile was declared to be 8 furlongs of 40 perches of 16½ feet each. The statute mile is, therefore, 1760 yards, or 5280 feet. See WEIGHTS AND MEASURES.

The mile is used as an itinerary measure in almost

all countries of Europe, particularly those which were formerly under the sway of the Romans; but it is very difficult to conjecture the cause which has given rise to the great diversity of its values. It has been supposed that in some countries the Roman mile was confounded with the ancient Celtic league. The following table shows the length, in statute miles of 1760 yards, of the modern mile, and also the leagues of various countries in English yards:

MILE OF DIFFERENT NATIONS.

English yds.	English yds.

Milford-Haven, a harbor of England, on a basin or deep inlet of the Atlantic, on the coast of South Wales, county Pembroke, forming one of the best ports in the British dominions. Latitude of St. Anne's Heads, the north-western extremity of the entrance, and on which are three light-houses, with fixed lights, $51^{\circ} 41' N.$, long. $50^{\circ} 10' 25'' W.$ Length of haven about 15 miles; average breadth, 2 miles. It is completely land-locked, has deep water, and the whole shipping of the empire might ride here as safely as in dock, in any weather; while the access is easy, and the egress can be accomplished, by aid of the strong ebb, even in head winds. It has for some time been a favorite scheme with the southern States to have a line of steamers between this port and Norfolk, Virginia, and thereby secure a portion of the importing and carrying trade now absorbed by the ports of New York and Boston.

Milk (Fr. *Lait*; It. *Latte*; Lat. *Lac*), a fluid secreted by the female of all those animals denominated *mammalia*, and evidently intended for the nourishment of her offspring. The milk of every animal has certain peculiarities which distinguish it from all other milk. But the animal whose milk is most used by man, and with which, consequently, we are best acquainted, is the cow. The external character of all milk is that of a white opaque fluid, having a sweetish taste, and a specific gravity somewhat greater than that of water. When allowed to remain at rest, it separates into 2 parts; a thick whitish fluid called *cream*, collecting in a thin stratum over its surface, and a more dense watery body, remaining below. Milk which has stood for some time after the separation of the cream, becomes acedent, and then coagulates. When the coagulum is pressed gently, a serous fluid is forced out, and there remains the caseous part of the milk, or pure cheese. Butter, one of the most valuable animal products, is solidified cream, and is obtained artificially by churning. Milk has always been a favorite food of most European nations, and especially of the British. *Lacte et carne vivunt*, says Cæsar of our ancestors; and the same articles still continue to form a large part of our subsistence. See articles BUTTER, CHEESE, DAIRY.

Millet (Ger. *Hirse*; Fr. *Millet*, *Mil*; It. *Miglio*, *Panicastrello*; Sp. *Mijo*; Lat. *Milium*, *Panicum miliaceum*). There are 3 distinct species of millet; the Polish millet, the common or German millet, and the Indian millet. It is cultivated as a species of grain;

and is sometimes employed to feed poultry, and as a substitute for rice. The Indian millet grows to a large size; but the autumns in England are seldom dry and warm enough to allow of its being cultivated here.—*LOUDON'S Encyc. of Agriculture*.

Milliner. Defined by Shakspeare and Johnson as a seller of ribbons and dresses for women, a very ancient occupation; the term is supposed to be derived from Milan. There are men-milliners, and the adoption of such a trade by the male sex has been strongly and justly censured. In 1810, men-milliners and other classes of an epicene character were very strongly censured in the Society of Arts. Young females are employed at all seasons, and in all weathers, to carry handboxes through the streets, exposed to the insolence of libertines, and the perils of vicious example, while the perfumed coxcomb ["He was perfumed like a milliner."—*Shakspeare*.] measures ribbons safely at home, or folds gauzes, and licks the while in lady phrases to females of distinction.—*Butler*.

Mill-stones (Ger. *Mühlsteine*; Fr. *Pierres meulières*; It. *Mole macine*; Sp. *Muelas de Molino*; Rus. *Schernowoi kamen*), the large circular stones, which, when put in motion by machinery, grind corn and other articles. The diameter of common mill-stones is from 5 to 7 feet, and their thickness varies from 12 to 18 inches. These stones have been principally imported from Rouen and other parts of France; the burr-stones of that country being supposed to be more durable than our own. The island of Milo, in the Archipelago, furnishes mill-stones of a very excellent quality. They are exported to Greece, Italy, and other countries on the Mediterranean, where they are employed in grinding the hard wheat, or *grano duro*, used in the manufacture of macaroni, vermicelli, etc. The quarries are wrought on account of government, and the stones sold at moderate prices fixed by a tariff, which, however, leaves a handsome profit to the State.—*TOURNEFORT, Voyage au Levant*; *STRONG'S Greece*. The stones used by millers are of various sizes, according to the intensity of moving power obtainable. Technically, the two stones are called the runner and the bedder; and the operation of "hanging a runner," or adjusting the upper stone over the lower, is one of some delicacy; since not only must the two be rigorously parallel, but the distance between them must depend on the fineness of the flour to be produced and on the rapidity with which the upper stone rotates. Other things being equal, the greater the velocity, the closer must the stones be together, else the centrifugal force would drive away the corn unground or half-ground.

Mineral Pitch, Maltha. A solid, softish bitumen. Sp. gr. about 1.5.

Mineral Tar. The bituminous substance called *petroleum*. It is brown, viscid, and unctuous. Its specific gravity is 0.88. It is found in Britain, and on the continent of Europe, in the West Indies (Barbadoes tar), and in Persia. It may be resolved by distillation into naphtha and petroleum.

Mines (*Mine*, Fr.; *Mwyn*, or *Mwen*, Welsh), a subterranean work or excavation for obtaining metals, metallic ores, or other mineral substances.

Minim. The smallest liquid measure, generally regarded as about equal to one drop. The fluid drachm is divided into 60 minims.

Minnesota, a north-western Territory of the United States of America, lies between lat. 42° 30' and 49° N., and long. 91° and 103° 5' W. Area, 141,839 square miles. Population, 1850, whites, 6,038; colored, 89; total, 6,077; in 1857 estimated at 150,000.

Physical Features.—Minnesota is an elevated table-land, with a surface but little varied, being mostly a rolling prairie, abounding with lakes of pure water, and streams which flow in all directions, excepting toward the west. The soil is a fertile, sandy loam, easily cultivated, and well adapted to agricultural purposes. The Mississippi River rises centrally in the Territory, in Itasca Lake, a beautiful sheet of water. The river flows first in an eastern, thence in a southern direction, to the confines of the Territory, in its course to the ocean. It is also drained by the Missouri and its numerous tributaries, the Red River of the North, whose waters pass off to Hudson Bay, and the St. Louis entering Lake Superior on the eastern border of the Territory. Forests of pine and other valuable woods for timber, border the principal streams, and lead and copper ore have been found to some extent, and iron ore on the shore of Lake Superior. There were in the Territory in 1850, 5,035 acres of improved land, and 23,846 acres of unimproved land in farms. Cash value of farms, \$161,948; and the value of implements and machinery, \$15,981. **Live Stock.**—Horses, 860; asses and mules, 14; milch cows, 607; working oxen, 655; other cattle, 740; sheep, 80; swine, 734. Value of live stock, 92,859. **Agricultural Products.**—Wheat, 1,401 bushels produced; rye, 125; Indian corn, 16,725; oats, 30,582; barley, 1,216; buckwheat, 515. Value of the products of market gardens, \$150; pounds of butter made, 1,100 lbs.; maple sugar, 2,950; beeswax and honey, 80; tons of hay, 2,019; potatoes, 21,145 bushels; wool, 85 lbs.; sweet potatoes, 200; peas and beans, 10,002. Value of slaughtered animals, \$2,480. The common traveling roads and military roads are the only improvements yet constructed. The route of the great Northern Pacific railroad has been explored across the Territory. Congress, in May 1856, appropriated over 1,000,000 acres for the construction of railroads.

The French were the first Europeans to explore the region now comprised in Minnesota, and the Mississippi River was explored by the Jesuit fathers, even beyond the Falls of St. Anthony, at a very early period. The first American military post was established here in 1819, and called Fort Snelling. This county has formed a part of several territorial governments: the last were Iowa and Wisconsin. It was formed into a Territory with its present name (in 1849), which it derives from the original Indian name of St. Peter's River.

Mint. Athelstan first enacted regulations for the government of the mint, about A.D. 928. There were several provincial mints under the control of that of London. Stow says the mint was kept by Italians, the English being ignorant of the art of coining, 7 Edward I., 1278. The operators were formed into a corporation by the charter of King Edward III., in which condition it consisted of the warden, master, comptroller, assay-master, workers, coiners, and subordinates. The first entry of gold brought to the mint for coinage, occurs 18 Edward III., 1343. Tin was coined by Charles II., 1634; and gun-metal and pewter by his successor, James. Between 1806 and 1810, grants amounting to £262,000 were made by Parliament for the erection of the present fine structure in London. The new constitution of the mint, founded on the report of the Honorable Mr. Wellesley Pole, took effect in 1815. The master is now the chief officer.

The general appropriation bill makes provision for

the expenses of the mint and branches of the United States for the fiscal year, to the following effect:

Mint at Philadelphia.....	\$177,200
" New Orleans.....	63,200
" Charlotte, N. C.....	11,600
" Dahlonega, Ga.....	10,880
" San Francisco.....	277,800
" New York Assay Office.....	62,200

Congress loses sight of the fact that the coinage of the branches at New Orleans, Dahlonega, and Charlotte, could be easily dispensed with, and with decided advantage to the Treasury. Those branches were established at periods when the bulk of American gold was produced in the southern Atlantic States. Now the supplies are mainly from California, and the expenses at the three branches named are a dead weight upon the Treasury. The coinage at Dahlonega and Charlotte, particularly, is too trifling to render either necessary or expedient any further operations there. The coinage at each place last year, and the appropriations for the coming year, are as follows:

	Coinage—1855.	Expenses—1855.
Philadelphia.....	\$12,045,752 93	\$177,200
New Orleans.....	2,368,500 00	63,200
Dahlonega.....	116,773 50	10,880
Charlotte.....	217,935 50	11,600
San Francisco.....	21,121,752 43	277,800
New York Assay Office.....	20,441,813 63	62,200
Total.....	\$56,812,732 99	\$602,880

The coinage at Philadelphia, in 1855, was suspended for several months, in order to make extensive improvements, and to make the building, for the first time, fire proof. The coinage of the parent mint has of late years been over 50,000,000 annually. The above statement will, however, show that the coinage at New Orleans costs nearly 3 per cent., Dahlonega 9 per cent., and Charlotte over 5 per cent. A Report of the Committee on Commerce, in 1850, demonstrated that the actual cost of coinage for a series of years was as follows:

	Per cent.
At Philadelphia.....	2-23
New Orleans.....	6-63
Charlotte.....	9-00
Dahlonega.....	9-97

This, be it remembered, was when the coinage at the southern branches was more than double what it now is—the production of gold in that region being either actually less, or its profits less. The coinage at the three southern branches has now dwindled down to such small sums as to demand the closer attention of the government, and indicates the expediency of cessation at all those points. The following is a summary of the gold of domestic production for each year, 1850—1855:

Years.	New Orleans.	Charlotte.	Dahlonega.
1850.....	\$4,580,021	\$320,289	\$247,698
1851.....	8,770,722	816,061	379,809
1852.....	8,777,784	430,900	476,789
1853.....	2,006,673	805,157	452,290
1854.....	981,511	218,606	280,225
1855.....	411,517	216,988	116,652

Thus the production of gold which was at the two small branches \$567,000 in the year 1850, has gradually become reduced to \$333,000, and in order to maintain the *show of coinage* at these two points, an annual expenditure of \$22,000 is by Congress deemed expedient, when the same work could be done at Philadelphia for \$6000. Since 1838, the gross product of the gold mines of North Carolina, as far as indicated by the mint returns was \$4,238,236, and of Georgia \$5,686,864; total, \$9,925,100; and the aggregate expense of maintaining them \$22,000 annually, or about \$400,000 for the whole period. See COINAGE.

Mirage (Fr.), an optical illusion very common at sea, and especially in high latitudes, and sometimes also witnessed on land, particularly in Egypt and Persia, and on the margin of rivers and lakes, or on the sea-shore. It arises from unequal refraction in the

lower strata of the atmosphere, and causes remote objects to be seen double, as if reflected in a mirror, or to appear as if suspended in the air. When the effect is confined to apparent elevation, the English sailors call it *looming*; when inverted images are formed, the Italians give it the name of *Fata Morgana* (see the term). Ships in the whale fisheries are often despoiled, and sometimes known, by means of the mirage, at considerable distances. Captain Scoresby recognized his father's ship at the distance of more than 30 miles, and consequently when below the horizon, by its inverted image in the air, though he did not previously know that it was cruising in that part of the fishery. The mathematical theory of the phenomenon is given by Biot, in the *Memoires de l'Institut* for 1809. See also CADDINGTON'S *Optics*; BIOT'S *Traité de Physique*, tome iii.; BREWSTER'S *Optics*, *Cabinet Cyclopedia*.

Mississippi, one of the southern United States, is situated between 30° 10' and 35° N. lat., and between 80° 30' and 81° 35' W. long. It is 339 miles long from north to south, and 150 broad, containing 47,151 square miles. Population in 1816 was 45,929; in 1820, 75,448; in 1830, 136,806; in 1840, 375,651; and in 1850, 606,555.

The tract of land which now belongs to the present State of Mississippi was in olden times comprised under all those different ancient and general names under which the whole northern shore of the Mexican Gulf became known to Europe. In the year 1798 the name of the river was for the first time given to a Territory, and the great "Mississippi Territory" was erected, which included also the present State of Alabama. In the year 1817 the eastern portion of this Territory was separated from it and received the name of Territory of Alabama, while the western portion, with a very limited sea-shore (from Pearl River to Grande Bay), was admitted into the Union as the State of Mississippi.

The southern part of the State, for about 100 miles from the Gulf of Mexico, is mostly a sandy, level pine forest, interspersed with cypress swamps, open prairies, and inundated marshes, and a few hills of a moderate elevation. This region is generally healthy, and by cultivation produces cotton, Indian corn, sugar, indigo, etc. As you proceed further north, the country becomes more elevated and agreeably diversified, and the soil is a deep rich mold, producing abundantly cotton, Indian corn, sweet potatoes, indigo, peaches, melons, and grapes. The natural growth of timber consists of poplar, hickory, black walnut, sugar-maple, cotton-wood, magnolia, lime, and sassafras. The country in the north of the State is healthy and productive, and the lands watered by the Yazoo through its whole course in the north-west are very fertile.

There were in this State in 1850, 3,444,358 acres of land improved, and 7,046,061 of unimproved land in farms; cash value of farms, \$54,738,634, and the value of implements and machinery, \$5,762,927.

Live Stock.—Horses, 115,460; asses and mules, 54,547; milch cows, 214,231; working oxen, 83,485; other cattle, 436,254; sheep, 304,929; swine, 1,582,734. Value of live stock, \$19,403,662.

Agricultural Products, etc.—Wheat, 137,990 bushels; rye, 9,606; Indian corn, 22,446,552; oats, 1,503,288; barley, 228; buckwheat, 1121; peas and beans, 1,072,757; potatoes, 261,482; sweet potatoes, 4,741,795; rice, 2,719,856 pounds. Value of products of the orchard, \$50,405; produce of market gardens, \$46,250. Pounds of butter made, 4,346,234; of cheese, 21,191; sugar, hogsheds of, 888; molasses, 18,318 gallons; beeswax and honey, 397,460 pounds; wool, pounds produced, 559,619; cotton, 484,293; flax, 665; silk cocoons, 2; hops, 473; pounds tobacco, 49,960; hay, tons of, 12,504; hemp, 7 tons; clover seeds, 84 bushels; other grass seeds, 533; flax seed, 26 bushels; and

were made 407 gallons of wine. Value of home-made manufactures, \$1,164,020; of slaughtered animals, \$3,636,582.

The Mississippi River, with its various windings, forms the entire western boundary of the State, and its margin consists of inundated swamps, covered with a large growth of timber. Back of this the surface suddenly rises into what are called bluffs, and behind them the country is a moderately elevated table land with a diversified surface. Cotton is the principal production of the State. The Yazoo is the largest river that has its whole course in the State. It rises in the north-west part, and after a course of 250 miles, enters the Mississippi. The Pascagoula River, after a course of 250 miles, enters the Gulf of Mexico. At its mouth it widens into a bay. It is navigable for a considerable distance for small vessels. The Big Black River, after a course of 200 miles, enters the Mississippi just above Grand Gulf. It has a boat navigation of 50 miles. Pearl River rises in the central part of the State, and passing through it to the south, forming in its lower part the boundary between this State and Louisiana, enters Lake Borgne. Its navigation is much impeded by sand bars and obstructions of timber. The Homochitto is a considerable river which enters the Mississippi. Beside these, there are a few other small rivers and creeks. A chain of low, sandy islands, six or seven miles from the shore, enclose several bays or sounds, the largest of which are Mississippi Sound, Pascagoula Sound, and Lake Borgne.

Manufactures, etc.—There were in the State in 1850, 2 cotton factories, with a capital invested of \$38,000, employing 19 males and 17 females, producing 171,000 pounds of yarn, valued at \$30,500; 8 establishments, with a capital of \$100,000, employing 112 persons, and making 924 tons of castings, etc., valued at \$117,400; 157 flouring and grist mills, 266 saw mills, 130 tanneries, 53 printing offices, 56 newspapers, 2 tri-weekly, 2 semi-weekly, and 52 weekly publications. Capital invested in manufactures, \$1,835,395; value of manufactured articles, \$2,962,098. There were, January, 1856, 10 railroads in the State, 87 miles completed and in operation.

The principal places in the State are Jackson, the capital, Natchez, Grand Gulf, Washington, Vicksburg, Columbus, Aberdeen, and Holly Springs. On the 1st of January, 1854, there was one bank, with a capital of \$240,000. Total tonnage of the State, 1853, 2,509,000 tons.

DIRECT FOREIGN COMMERCE OF THE STATE OF MISSISSIPPI.		
Years.	Exports.	Imports.
1826.....	\$10,623
1836.....	5,650
1837.....
June 30, 1854 to June 30, 1850.	\$304,831	4,338
1851 and 1852.....	6,721

These returns are very incomplete, and only include the direct commerce. Most of the imports for Mississippi are entered in the port of New Orleans.

Mississippi River, the largest river of North America; and in length of navigable tributaries, and in extent of facilities afforded to commerce, the greatest river in the world.

Discovery of the Mississippi.—There seems to be little doubt that Pinedo, the Captain of Garay, saw for the first time the mouth of the Mississippi when he accomplished, in the year 1519, his first circumnavigation of the whole Mexican Gulf. We have no special report of Pinedo's proceedings. But on the few maps or sketches of the Mexican Gulf which were made in Spain soon after Pinedo's return (of the years 1520, 1521, and 1529), there is to be found, near the centre of the northern gulf shore, a large inlet called "Mar pequena" (the little sea), and a mighty river leading into it called "Rio del Espiritu Santo." Diego Ribero, on his large and accurate map (of 1529), which he made for the Emperor Charles V., has this bay and

the mouth of the river already under 29° north latitude, which is very remarkable, because it is the true latitude of the Mississippi mouth, and because it nearly decides the question that not Mobile Bay, as some have supposed, but the Mississippi, was indicated by it. Nobody could have made this discovery, given these names, and brought home the news of it, but Pinedo. Since that time the "Mar pequena" and the great River "Del Espiritu Santo" appear on the old maps. We can trace and follow them on the Spanish maps through the whole of the 16th century, and find them always, with some slight variations, in the middle part of the northern gulf shore, and generally under the latitude from 29° to 30° north.

It is thought that with the name "Mar pequena" is meant that great bay which is included between the projecting promontories formed by the Mississippi passes and the northern gulf shore, and for which we have no general name. The Mississippi passes must have appeared to the old Spanish navigators as very dangerous and difficult of approach. And very often they put the name of the Holy Cross to capes of this description.

The second traveler after Pinedo who saw and crossed the Mississippi was no doubt Cabeça de Vaca and his companions, between the years 1530-1535. From Cabeça de Vaca's report, it is evident that his commander, Narvaez, and his companions, got lost about Mobile or Perdido Bay, or somewhere else not very far to the east of the Mississippi. Once, he says, they believed themselves to have arrived at the "Bay of Espiritu Santo, near the Mississippi." Afterward Cabeça and his followers wandered westward in the direction of New Mexico; so they must have crossed the Mississippi. But that is all we can say. He mentions so many great rivers in his report, that we can not recognize among them the true "Rio Grande," the Mississippi.

De Soto.—Fernando de Soto was the third discoverer and principal old Spanish explorer of the Mississippi. He arrived at its borders, in the neighborhood of the so-called Chicawas bluffs, 1542, and ascended and descended the river, which in the reports of his expeditions is generally only called "Rio Grande," up and down. He died on the shore of the river, and was buried near its waters somewhere about the mouth of the Arkansas River. De Soto's successor, Moscoso, carried the rest of the Spanish army, in the year 1543, down the whole river, and he was the first commander who sailed from the mouth of the river into the sea. Which of the passes it was can not be made out. Biedma, one of the writers on De Soto and Moscoso, and one of their companions, states, however, that the river had different mouths and branches. In one of the reports on De Soto's expedition (by Garcilasso de la Vega) it is said that the Indian name of the great river was "Chucagua." Probably, in consequence of this, the geographers put sometimes on their maps the name "Chucagua" to the river. Generally, however, the old name of "Rio del Espiritu Santo" (River of the Holy Ghost) prevailed after De Soto for a long time. One of the historians of De Soto, the so-called "Portuguese gentleman of Elvas," sometimes calls it "the Great River of Guachoya." Guachoya was one of the places along the river where De Soto encamped. "In Guachoya," says Garcilasso, "the great river is called 'Tamalliseu'; in Nilco, 'Tapala'; in Coça, 'Mico'; at the port or mouth it is called 'Ri.'"

Luna.—In the year 1557 the Governor, Luna, was sent to Pensacola Bay, and from thence, with his captains and men, made many inroads into the interior toward the north and west. It is very possible, though it is nowhere exactly stated, that some of his men also got as far east as the Mississippi.

Marquette and La Salle.—The French Marquette (1673) and soon after him the Sieur de la Salle (1682) re-discovered the Mississippi, and saw a greater part

of the river than was ever seen before them. De la Salle was, after Moscoso (1643), the first who sailed (1682) down the whole river to its mouth, and entered the Mexican Gulf. He explored in boats the whole delta of the passes, and saw, without however naming them, all the principal passes. A little above the dividing point of the passes he erected a monument with the arms of France. This was on the 8th of April, 1682. On the 7th of the same month he had explored the principal branches of the river and seen the sea. He observed also the latitude of this place; but there is a great diversity about the results of his observations. Some say that he observed the latitude 27° north, as, for instance, that remarkable document of the taking possession of the country at the mouth of the river by La Salle. Also, Barcia says that La Salle observed the latitude of the mouth between 27° and 28° north latitude, "though," he adds, "some heard La Salle say that the mouth was between 28° and 29° north latitude." After this, La Salle ascended the stream again to the north.

Father Marquette (1672) was the person who introduced for the first time into geography the Indian name of the river, "Mississippi." He, however, gave it at the same time the Christian or French name "*Riviere de Conception*." La Salle seems to have ratified this latter name. He called the river, after the great French minister, "*Riviere de Colbert*." On some maps even the whole upper Mississippi country is called "La Colbertie" (Colbert's land). The name Riviere Colbert may be called La Salle's name for the Mississippi. It seems, however, soon to have given way to the Indian name Mississippi, which really was already longer known to the European missionaries, and which was already oftener adopted in books and in commerce than those new inventions of the European discoverers.

Tonti.—The next man after De la Salle who came down the Mississippi was the Sieur de Tonti, or Tonty, who had already accompanied La Salle on his first navigation. De Tonti had heard that La Salle had set out from France to the mouth of the river, and he came, in the year 1685, down to meet him at the shores of the Gulf. He arrived there during "the Holy Week" (Easter) of 1686, but did not find La Salle, who had reached the coast of Texas instead of that of the Mississippi passes.

Origin of the Name.—"One of the names of the river under which Iberville, in 1699, had heard it called," says Charlevoix, "was *Malbouchia*." But the name Mississippi seems already then to have been quite common. At least the first journal written in this colony—that of Captain Sauvol (1699, 1700)—uses always the name Mississippi, and not once that of Riviere Colbert. In the year 1712 an attempt was made to give the river still another name. The great King of France himself ordered, in the letters patent to Crozat, that the great river "heretofore called Mississippi" should henceforward be called "*Riviere St. Louis*." But this name, newly sent out from France by royal authority, did not keep its ground against the old long-ago adopted Indian name. Charlevoix, who traveled along the river in 1721–22, and published his work in 1744, never uses it. He always calls it "*Mississippi*" or "*Micissipi*." Into general use the name Riviere St. Louis has certainly not come; but on maps made by royal geographers or great savans like D'Anville, we find it still used in the year 1732, though always besides the name Mississippi.

The name "Mississippi" is an Ojibbeway word, which the first discoverers of that stream heard pronounced in their missions round Lake Superior. According to some, its meaning is "*the Great Water*." Others, for instance the Reverend Bishop Baraga, explain it as "rivers," or "waters from all sides."

The French authors generally write "Missisipi;" Spanish authors have always "Misisiipi." We now

double every consonant in it, and write "Mississippi," in which word, I have no doubt, some letters could be spared.—J. G. KOHL.

Description.—Its extreme source, according to the explorations of Schoolcraft, July 13, 1832, is Itaska Lake, 47° 10' N. lat., and 95° 54' W. long., at an elevation of 1500 feet, and the distance of 3160 miles above the Gulf of Mexico. Itaska Lake is a beautiful sheet of water, lying among hills surmounted by pines. The outlet of the lake is 10 or 12 feet broad, and from 12 to 18 inches deep. Its course is then northwardly and north-eastwardly, and it passes through Lakes Irving and Travers, and then eastwardly and south-eastwardly, and through some small lakes, to Lake Cass. This lake is of considerable extent, and contains a large island, 182 miles below its source, and its surface is elevated 1330 feet above the Gulf of Mexico. Its course is west to Lake Winnipeg, then south-west, through Little Winnipeg Lake, until it receives Leech Lake Fork, the outlet of a considerable lake of the same name. The most northern point attained by the river is a few minutes short of 48°; it then pursues a winding course eastwardly, passing through some small lakes, until it attains a southwardly direction. The average descent of the Mississippi, from its source to its entrance into the Gulf of Mexico, is a fraction over five inches per mile. The region about the source of the Mississippi is an elevated table land, abounding in small lakes of pure water, and fed chiefly by springs.

The average width of the Mississippi below the Missouri is about a mile; but the large rivers which enter it greatly increase its depth. Its medial current is about four miles an hour. At the head of the delta, the depth is from 75 to 80 feet; at New Orleans it is

100. At the distance of 105 miles below New Orleans, by the course of the river, but 90 in a direct course, this majestic river enters the Gulf of Mexico by several mouths, the principal of which are called the Balize, or North-east Pass, in $29^{\circ} 08' 30''$ N. lat., and $89^{\circ} 01' 24''$ W. long. Draining a country of over 1,000,000 square miles in extent, it would naturally be expected that its spring floods would be vast; and in consequence of them, it overflows its banks at that season to a great extent. From the sources to the mouth of the Missouri, the flood commences in March, and does not subside before the last of May, at an average height of 15 feet. From the Missouri to the Ohio it rises 25 feet, and below the Ohio, for a great distance, 50 feet. At every flood it overspreads a country, chiefly on its western side, from 10 to 30 miles wide, 550 miles from its mouth. This river is extremely winding in its course; and sometimes a bend will occur of 30 miles in extent, in which the distance across the neck will not exceed a mile. This circumstance undoubtedly impedes the current, and thus favors navigation.

There are three light-houses at the passes, and one at the head of the South Pass, viz.: the one at the north-east is a fixed light, elevated 78 feet above the surface of the Gulf, and visible $13\frac{1}{2}$ nautical miles; at the South Pass is a revolving light, on a tower of 54 feet above the sea; at the south-west pass is a fixed light, elevated 60 feet above the surface of the Gulf, and visible 12 nautical miles; and one with a fixed light at the head of the South Pass, built of iron in 1852: it shows a fixed light.

The acquisition of Louisiana and Florida by the United States having included within their boundary the whole river from its source to the Gulf of Mexico, and the stipulation in the treaty of 1783, securing to British subjects a right to participate in its navigation, not having been renewed by the Treaty of Ghent, in 1814, the right of navigating the Mississippi is now vested exclusively in the United States.—WHEATON'S *International Law*, p. 258.

"The right of the United States to participate with Spain in the navigation of the River Mississippi, was rested by the American government on the sentiment written in deep characters on the heart of man, that the ocean is free to all men, and its rivers to all their inhabitants. This natural right was found to be universally acknowledged and protected in all tracts of country, united under the same political society, by laying the navigable rivers open to all their inhabitants. When these rivers enter the limits of another society, if the right of the upper inhabitants to descend the stream was in any case obstructed, it was an act of force by a stronger society against a weaker, condemned by the judgment of mankind. The then recent case of the attempt of the Emperor Joseph II., to open the navigation of the Scheldt from Antwerp to the sea, was considered as a striking proof of the general union of sentiment on this point, as it was believed that Amsterdam had scarcely an advocate out of Holland, and even there her pretensions were advocated on the ground of treaties, and not of natural right. This sentiment of right in favor of the upper inhabitants must become stronger in the proportion which their extent of country bears to the lower. The United States held 600,000 square miles of inhabitable territory on the Mississippi and its branches, and this river with its branches afforded many thousands of miles of navigable waters penetrating this territory in all its parts. The inhabitable territory of Spain below their boundary, and bordering on the river, which alone could pretend any fear of being incommoded by their use of the river, was not the thousandth part of that extent. This vast portion of the territory of the United States had no other outlet for its productions, and these productions were of the bulkiest kind. And, in truth, their passage down the

river might not only be innocent, as to the Spanish subjects on the river, but would not fail to enrich them far beyond their actual condition. The real interests, then, of the inhabitants, upper and lower, concurred in fact, with their respective rights."—WHEATON'S *International Law*, pp. 258, 259.

Missouri, one of the western United States, is situated between 36° and $40^{\circ} 36'$ N. lat., and between 89° and $95^{\circ} 30'$ W. long. It is 287 miles long, and 230 broad, containing 65,037 square miles. Population in 1810 was 19,833; in 1820, 66,586; in 1830, 140,074; in 1840, 383,702; and in 1850, 682,043.

Physical Features, etc.—This State presents a great variety of surface and soil. Alluvial or bottom land is found on the margin of the rivers; receding from them the land rises in some places gently, and in others very abruptly, into elevated barrens or rocky ridges. In the interior, bottoms and barrens, naked hills and prairies, heavy forests and streams of water, may often be seen at one view, presenting a diversified and beautiful landscape. The south-east part of the State has a very extensive tract of low, marshy country, abounding in lakes, and liable to inundations. Back of this a hilly country extends as far as the Osage River. This section is rich in minerals. The lead region covers an area of more than 3,000 square miles. In St. Francis county is the celebrated "Iron Mountain," elevated 300 feet above the surrounding plain, and $1\frac{1}{2}$ miles across its summit, and 80 per cent. of its mass pure iron. Five miles distant is the Pilot Knob, 300 feet high, and with a base a mile and a half in circumference of the same species of rich ore. Between the Osage and Missouri Rivers is a tract of country very fertile, and agreeably diversified with woodland and prairie, and abounding with coal, salt, etc. The country north of the Missouri is emphatically "the garden of the West." There is no part of the world where a greater extent of country can be traversed more easily when in its natural state. The surface is for the most part delightfully undulating and variegated, sometimes rising into picturesque hills, then stretching away into a sea of prairies, occasionally interspersed with shady groves and shining streams.

There were in this State in 1850, 2,938,425 acres of land improved, and 6,794,245 of unimproved land in farms; cash value of farms, \$63,225,543, and the value of implements and machinery, \$3,981,525. *Live Stock*.—Horses, 225,319; asses and mules, 41,667; milch cows, 230,169; working oxen, 112,168; other cattle, 449,173; sheep, 762,511; swine, 1,702,625; value of live stock, \$19,887,580.

Agricultural Products, etc.—Wheat, 2,981,652; rye, 44,268; Indian corn, 36,214,597; oats, 5,278,079; barley, 9,631; buckwheat, 23,641; peas and beans, 46,017; potatoes, 939,006; sweet potatoes, 335,505; rice, 700 pounds; value of the product of the orchard, \$514,711; produce of market gardens, \$99,454; pounds of butter made, 7,834,359; of cheese, 203,572; maple sugar, 178,910; molasses, 5,636 gallons; beeswax and honey, 1,328,972 pounds; wool, 1,627,164 pounds produced; flax, 527,160; silk cocoons, 186; hops, 4,130; tobacco, 17,113,784; hay, 116,925 tons; hemp, 16,028 tons; clover seeds, 619 bushels; other grass seeds, 4,346; flax seed, 13,696; and were made 10,563 gallons of wine. Value of home-made manufactures, \$1,674,705; of slaughtered animals, \$3,367,106. The Mississippi winds along the entire eastern boundary of the State for a distance of 400 miles, and receives in its course the waters of the Great Missouri, which indeed deserves to be regarded as the main stream. Through the central and richest part of the State the Missouri rolls its immense volume of water, being navigable for five months in the year for steamboats 1,800 miles from its entrance into the Mississippi. The La Mine, Osage, and Gasconade on the south, and the Grand and Chariton on the north side, are navigable

Tariff of Charges on Cotton at Mobile.—The proprietors of the several presses and warehouses at Mobile, have adopted the following uniform tariff of charges on cotton: Factor's storage on cotton for the season, 20 cents per bale; compressing cotton, 50 cents per bale; extra ropes on compressed cotton, each $6\frac{1}{2}$ cents per bale; labor on ship marked cotton, 5 cents per bale; drayage, compressed cotton, 5 cents per bale; wharfage, compressed cotton, 5 cents per bale; storage on cotton going coastwise, per week, 5 cents per bale; turning out and re-storing cotton, 5 cents per bale; arranging, 3 cents per bale.

Alabama Finances.—The Comptroller and Treasurer of this State have published the biennial reports for the fiscal year ending September 30, 1856, which show a total of receipts into the treasury, from all sources,

of \$798,008 46; of which sum \$616,863 15 was on the assessment of taxes for the year 1855; the balance, \$81,145 31, making up the first sum, was derived from taxes of 1844, 1847, 1851, 1853, 1854, from State Bank branches, bonus from Stock Banks, Marietta and Ohio Railroad, 16th section fund, and 2 and 8 per cent. funds, etc. The above sum of receipts, \$798,008 46, with the balance in the treasury, September 30, 1855, of \$1,192,652 96, makes \$1,990,656 42. The disbursements for the year ending 30th September last, amount to \$486,867 52, of which \$158,552 21 were paid for educational purposes, \$100,000 to Bank Commissioner, \$61,745 50 to pay members of the Legislature, etc., \$26,350 87 to insane hospital, and the balance to the judiciary, university fund, etc., etc. There was in the treasury on September 30, 1846, \$1,503,788 90.

Mobile Bay, Alabama.—The bay sets up from the Gulf of Mexico, and is 30 miles long, and on an average 12 miles broad. It communicates with the gulf by two straits, one on each side of Dauphin Island. The strait on the west side will not admit of vessels drawing more than 5 feet water; that on the east side, between the island and Mobile Point, has 22 feet water, and the channel passes within a few yards of the point. There is a bar across the bay, near its upper end, which has only 11 feet water. The Mobile Point light-house is on the east side of the entrance into Mobile Bay. Lat. $30^{\circ} 18' 48''$ north, long. $88^{\circ} 00' 30''$ west. Shows a revolving light, elevated 57 feet above the level of the sea, and visible for a distance of 12 nautical miles. Three miles south-west of Mobile Point, is Sand Island light, lat. $30^{\circ} 11' 18''$ north, long. $88^{\circ} 02'$ west. Shows a fixed light, elevated 54 feet above the sea, and is visible for a distance of 12 nautical miles. Within the bay, a little south of the city of Mobile, is the Choctaw Point light-house; it shows a fixed light, elevated 54 feet above the surface of the bay, and is visible for a distance of 11 nautical miles.

Mocha, the principal port in the Red Sea frequented by Europeans, in that part of Arabia called Yemen, about 40 miles to the north of the Strait of Bab-el-mandeb, lat. $13^{\circ} 19' 30''$ north, long. $43^{\circ} 20'$ east. Population variously estimated; but may, perhaps, amount to from 5000 to 7000. It is encircled with walls, and indifferently fortified. Its appearance from the sea is imposing. Mocha is situated on the margin of a dry sandy plain. It is built close to the shore, between two points of land which project and form a bay. Vessels drawing from 10 to 12 feet water may anchor within this bay at about a mile from the town; but large ships anchor without the bay in the roads, in 5 or 7 fathoms water—the grand mosque bearing east south-east, and the fort to the south of the town south by east, distant about two miles from the shore. The great article of export from Mocha is coffee, which is universally admitted to be of the finest quality. It is not possible to form any very accurate estimate of the quantity exported; but we believe it may be taken at 10,000 tons, or perhaps more. The greater portion is sent to Djidda and Suez; but there

is a pretty large export to Bombay, and other parts of India, whence some is sent to Europe; occasionally, however, the exports from Mocha and Hodeida, direct from Europe, are very considerable. Besides coffee, the principal articles of export are, dates, adjuve, or paste made of dates, myrrh, gum Arabic, olibanum, senna (*cassia senna*), sharks' fins, tragacanth, horns and hides of the rhinoceros, balm of Gilead, ivory, gold dust, civet, aloes, sagapenum, etc. The principal articles of import are, rice, piece goods, iron, and hardware, etc. The ivory, gold dust, and civet, met with at Mocha, are brought from the opposite coast of Abyssinia, whence are also brought slaves, ghee, etc. The greater part of the foreign trade of Mocha is transacted by the Banians; and it is much safer to deal with them than with either Turks or Arabs. Europeans pay a duty of 3 per cent. *ad valorem* on all goods imported by them from Europe, India, or China; the duty being levied on the amount of the sales. The buyer pays brokerage, coolie and boat-hire. All kinds of foreign goods are sold on credit, and the payment is made by three instalments, or at a certain day, according as may have been agreed on. Coffee is always paid for in ready money. On the sale of other goods, the produce of the country, a credit is given; or if ready money be paid, a discount is allowed at the rate of 9 per cent. When goods are discharging the master must furnish the custom-house officer with a manifest, or account of the marks, numbers, and contents of each package. He then opens two or three bales taken at random; and if they correspond with the account delivered, no further examination is made; but if they do not correspond, the whole bales are opened, and double duty is charged upon the excess. The quantities being thus ascertained, their value is learned from the account of sales rendered by the seller, and the duty charged accordingly. In this respect there is nothing to object to at Mocha; but a good deal of extortion is practiced in the exaction of port charges, presents, etc., which may, however, be defeated by proper firmness. The port charges on ships, or *three-mast* vessels, may amount to about 400 Mocha dollars, and those on brigs to about half as much. Provisions are plentiful and cheap; but water is dear; that in the vicinity being brackish and unwholesome, whatever is used for drinking, by all but the poorest persons, is brought from Mosa, about 20 miles off. Fish are abundant and cheap, but not very good.

Mogadore, a sea-port town on the west coast of Morocco, lat. $31^{\circ} 50'$ north, long. $9^{\circ} 20'$ west. Population about 10,000. It is indifferently fortified; the country in the immediate vicinity is low, flat, sandy, and unproductive. Water is scarce and rather dear; being either rain-water collected and preserved in cisterns, or brought from a river about $1\frac{1}{2}$ miles distant. The port is formed by a small island lying to the southward of the town; but as there is not more than 10 or 12 feet water in it at ebb tide, large ships anchor without, the long battery bearing east, distant $1\frac{1}{2}$ miles. The principal imports are English woolen and cotton stuffs and hardware, German linens, tin, copper, earthenware, mirrors, glass, sugar, pepper, paper, and a variety of other articles. The exports principally consist of sweet and bitter almonds, gum Arabic, and other gums, beeswax, cow and calf skins, ivory, ostrich feathers, gold dust, olive oil, dates, etc.

"The duties levied on imported articles are not paid in money, but in kind, and on English manufactures, army and navy cloth, brass, copper, tea, and sugar, and in fact, in all cases, with few exceptions, are rated at 20 per cent., or a fifth part of the goods, whatever they may be, that are landed. This primitive mode of business is also accompanied by disadvantages, and assists, in conjunction with the high tariff, to cripple any endeavors attempted to bring the Barbary States in closer mercantile alliance with ourselves." It is to be hoped that the government of Morocco may become

alive to the mischievous consequences of this system. Nothing would do so much to promote industry and civilization in the country, as the effectual reduction, or rather the total repeal, of the existing duties on exports.

Mohair (Ger. *Mohr*; Fr. *Moire*; It. *Moer*; Sp. *Mue*, *Muer*), the hair of a variety of the common goat, famous for being soft and fine as silk, and of a silvery whiteness. It is not produced anywhere but in the vicinity of Angora, in Asia Minor. The exportation of this valuable and beautiful article, unless in the shape of yarn, was formerly prohibited; but it may now be exported unspun. The production, preparation, and sale of mohair have long engrossed the principal attention of the inhabitants of Angora; and it used to form an important article of Venetian commerce. It is manufactured into camlets and other expensive stuffs. Hitherto but little has been imported into England. See, for further particulars, *TOURNEFORT, Voyage du Levant* and *URQUHART on Turkey and its Resources*.

Moire Antique. In an ordinary woven goods the threads cross each other at right angles; the long threads forming the warp, and the short threads the weft. According as the fabric is of high quality, so do these threads intersect in a regular and equable quality; but be it as good as it may, there are always some irregularities; they may escape the eye, but they become apparent in a singular way. If good silk be wrapped tightly and carelessly round a roller, it may become moire much against the inclination of the possessor; it will have acquired an irregular kind of glossing in some parts rather than in others; and this irregular glossing, when viewed from a little distance, presents somewhat of the appearance of moire, or watering—who knows? Perhaps an accident to a piece of rolled silk suggested the first idea of watering as a distinct mode of adornment to silken goods? Such accidents have frequently occurred in the history of manufactures. However, accident or no accident, watered silks have long been in use, both in this country and in France. If a pattern be engraved upon one cylinder in relief, and a similar pattern on another cylinder, in sunken devices; and if one of these be heated from within, and if a piece of silk or velvet be drawn between the cylinders, then will the silk or velvet acquire an embossed pattern, because some parts of the surface are more pressed, and are consequently more glossy than the rest. Numerous varieties of this process are employed in the preparation of fancy goods. But this is not exactly watering. For this process two layers of silk are laid face to face, and are pressed tightly between rollers. What follows? However close the threads may be, there are still interstices between them; they follow each other in ridge and hollow fashion throughout the length and breadth of the piece. Now, if the slightest irregularity exists in the pressure, some of the threads become pressed in particular parts more than others; and the over-pressed portions present a greater gloss, a greater power of reflecting light than the rest. The more capriciously these proportions distribute themselves, the more undulatory and cloudy will be the result. We do not say that the actual process is nothing more than this, but that this is the basis on which the whole is founded. The goods may be sprinkled with water previously or not; the rollers may be both heated or both cold, or one heated and one cold; the rollers may be plain or variously indented; they may move smoothly over each other or may have a slight lateral movement—how these variations of method would produce variations of effect every one will see. The adjective "antique" is most likely given to the silks thus produced from their resemblance to the tabby silk dresses worn in former times. It is chiefly produced in France; but in Spitalfields, England, its weavers and moireurs combined, have lately copied the art so cleverly as actually to excel the French. But Spitalfields

guards its secret as sedulously as the magician in a fairy tale guards the captive princess in the castle, and will not let the world have a peep at their doings.

Molasses, or Melasses (Fr. *Sirap de Sucre, Melasses*; Ger. *Syrup*; It. *Mielazzo di zucchero*; Sp. *Miel de azucar, Chancaca*; Port. *Melasso, Assucar liquido*; Rus. *Patoka sacharnaja*), the uncrystallizable part of the juice of the sugar cane, separated from the sugar during its manufacture. It is of a brown or black color, thick, and viscid; has a peculiar odor, and a sweet empyreumatic taste. About 8 gallons of proof spirit may, it is said, be obtained from a cwt. of molasses, such as has recently been imported; but this depends, of course, wholly on the richness of the molasses. Part of the refuse that remains, after refining muscovado sugar, is a sweet syrup, which, as well as the syrup that remains after boiling molasses to obtain bastards, is called treacle. But the treacle obtained from the former is always preferred to that obtained from the latter, and fetches 50 cents per cwt. more. Molasses is sometimes used in preparing the coarser sort of preserves; and on the European continent it is extensively used in the manufacture of tobacco. The following statistics show the foreign trade of the United States in molasses, and also show the receipts to the foreign and home of this staple. The last table shows the average value of the different kinds of molasses at the port of New York for two years:

It will be seen by the foregoing statistics, that the receipts of foreign molasses in the United States for the year ending December 31, 1856, were 25,035,724 gallons, against total receipts in 1855 of 24,152,446 gallons, and the total consumption of this description in 1856 was 23,014,878 gallons, against a consumption

of foreign in 1855 of 23,533,428 gallons, being a decrease in the consumption of foreign in 1856, as compared with 1855, of 2·20 per cent., while the total consumption of foreign and domestic in 1856 was 39,608,878 gallons, against a consumption in 1855 of 47,266,085 gallons, being a falling off in 1856 of 7,657,207 gallons, or the large decrease of 16·20 per cent.

The consumption of all kinds in 1856, as shown, was 16·20 per cent. less than that of 1855, while that of 1855 was 16½ per cent. smaller than the consumption of 1854. This continued large decrease is attributable, in a great measure, to the rapid decline in the yield of Louisiana cane. The following table shows the average value of molasses in New York for two years.

MOLASSES.—ITS AVERAGE VALUE AT NEW YORK FOR TWO YEARS.

See SUGAR.

Mole, in architecture, a massive work formed of large stones laid in the sea by means of coffer dams, extended either in a right line or an arc of a circle, before a port, which it serves to close; to defend the vessels in port from the impetuosity of the waves, and

to prevent the passage of ships without leave. It is frequently fortified. *Mole* is sometimes used to signify the harbor itself, which it serves to form or defend.

Money. When the division of labor was first introduced, commodities were directly bartered for each other. Those, for example, who had a surplus of corn, and were in want of wine, endeavored to find out those who were in the opposite circumstances, or who had a surplus of wine and wanted corn, and then exchanged the one for the other. It is obvious, however, that the power of changing, and, consequently, of dividing employments, must have been subjected to perpetual interruptions, so long as it was restricted to mere barter. A carries produce to market, and B is desirous to purchase it; but the produce belonging to B is not suitable for A. C, again, would like to buy B's produce, but B is already fully supplied with the equivalent C has to offer. In such cases—and they must be of a constant occurrence wherever money is not introduced—no direct exchange could take place between the parties; and it might be very difficult to bring it about indirectly. The difficulties that would arise on such occasions, and the devices that would be adopted to overcome them, have been very well illustrated by Colonel Torrens, in his work on the *Production of Wealth*, p. 291. The extreme inconvenience attending such situations must early have forced themselves on the attention of every one. Efforts would, in consequence, be made to avoid them; and it would speedily appear that the best or rather the only way in which this could be effected, was to exchange either the whole or a part of one's surplus produce for some commodity of known value, and in general demand; and which, consequently, few persons would be inclined to refuse to accept as an equivalent for whatever they had to dispose of. After this commodity had begun to be employed as a means of exchanging other commodities, individuals would become willing to purchase a greater quantity of it than might be required to pay for the products they were desirous of immediately obtaining; knowing that should they, at any future period, want a further supply either of these or other articles, they would be able readily to procure them in exchange for this universally desired commodity. Though at first circulating slowly and with difficulty, it would, as the advantages arising from its use were better appreciated, begin to pass freely from hand to hand. Its value, as compared with other things, would thus come to be universally known; and it would at last be used, not only as the common medium of exchange, but as a standard by which to measure the value of other things. Now this commodity, whatever it may be, is *money*.

An infinite variety of commodities have been used as money in different countries and periods. But none can be advantageously used as such, unless it possess several very peculiar qualities. The slightest reflection on the purposes to which it is applied, must, indeed, be sufficient to convince every one that it is indispensable, or, at least, exceedingly desirable, that the commodity selected to serve as money should (1) be divisible into the smallest portions; (2) that it should admit of being kept for an indefinite period without deteriorating; (3) that it should, by possessing great value in small bulk, be capable of being easily transported from place to place; (4) that one piece of money, of a certain denomination, should always be equal, in magnitude and quality, to every other piece of money of the same denomination; and (5) that its value should be comparatively steady, or as little subject to variation as possible. Without the *first* of these qualities, or the capacity of being divided into portions of every different magnitude and value, money, it is evident, would be of almost no use, and could only be exchanged for the few commodities that might happen to be of the same value as its indivisible portions, or as whole multiples of them; without the *second*, or the capacity of being kept or hoarded without deteriorating, no one would choose to exchange commodities for money, except only when he expected to be able speedily to re-exchange that money for something else; without the *third*, or facility of transportation, money could not be conveniently used in transactions between places at any considerable distance; without the *fourth*, or perfect sameness, it would be extremely difficult to appreciate the value of different pieces of money; and without the *fifth* quality, or comparative steadiness of value, money could not serve as a standard by which to measure the value of other commodities; and no one would be disposed to exchange the produce of his industry for an article that might shortly decline considerably in its power of purchasing.

The union of the different qualities of comparative steadiness of value, divisibility, durability, facility of transportation, and perfect sameness, in the precious metals, doubtless formed the irresistible reason that has induced every civilized community to employ them as money. The value of gold and silver is certainly not invariable, but generally speaking it changes only by slow degrees: they are divisible into any number of parts, and have the singular property of being easily reunited, by means of fusion, without loss; they do not deteriorate by being kept; and from their firm and compact texture, they are very difficult to wear. Their cost of production, especially that of gold, is so considerable, that they possess great value in small bulk, and can, of course, be transported with comparative facility; and an ounce of pure gold or silver taken from the mines in any quarter of the world, is precisely equal, in point of quality, to an ounce of pure gold or silver dug from the mines in any other quarter. No wonder, therefore, when all the qualities necessary to constitute money are possessed in so eminent a degree by the precious metals, that they have been used as such, in civilized societies, from a very remote era. "They became universal money," as Turgot has observed, "not in consequence of any arbitrary agreement among men, or of the intervention of any law, but by the nature and force of things." When first used as money, the precious metals were in an unfashioned state, in bars or ingots. The parties having agreed about the quantity of metal to be given for a commodity, that quantity was then weighed off. But this, it is plain, must have been a tedious and troublesome process. Undoubtedly, however, the greatest obstacle that would be experienced in early ages to the use of gold and silver as money, would be found to consist in the difficulty of determining the degree of their purity with sufficient precision; and the discovery of some means by which their weight and fineness might be readily and cor-

rectly ascertained, would be felt to be indispensable to their extensive use as money. Fortunately these means were not long in being discovered. The fabrication of coins, or the practice of impressing pieces of the precious metals with a stamp indicating their weight and purity, belongs to the remotest antiquity. GOUGET, *De l'Origine des Loix*, etc., tome i., p. 269. And it may safely be affirmed, that there have been very few inventions of greater utility, or that have done more to accelerate the progress of improvement.

It is material, however, to observe, that the introduction and use of coined money make no change whatever in the *principle* on which exchanges were previously conducted. The coinage saves the trouble of weighing and assaying gold and silver, but it does nothing more. It declares the weight and purity of the metal in a coin; but the *value* of that metal or coin is in all cases determined by precisely the same principles which determine the value of other commodities, and would be as little affected by being re-coined with a new denomination, as the burden of a ship by a change of her name. Inaccurate notions with respect to the influence of coinage seem to have given rise to the opinion so long entertained, that coins were merely the *signs* of values! But it is clear they have no more claim to this designation than bars of iron or copper, sacks of wheat, or any other commodity. They change for other things, because they are desirable articles, and are possessed of real intrinsic value. A draft, check, or bill may not improperly, perhaps, be regarded as the sign of the money to be given for it. But that money is nothing but a commodity; it is not a sign—it is a thing signified.

Money, however, is not merely the universal equivalent, or *merchandise banale*, used by society: it is also the *standard* used to compare the values of all sorts of products; and the stipulations in the great bulk of contracts and deeds, as to the delivery and disposal of property, have all reference to, and are commonly expressed in, quantities of money. It is plainly, therefore, of the utmost importance that its value should be preserved as invariable as possible. Owing, however, to improvements in the arts, the exhaustion of old mines, and the discovery of new ones, the value of the precious metals is necessarily inconstant; though, if we except the effects produced in the 16th century by the discovery of the American mines, it does not appear to have varied so much at other times as might have been anticipated. Great mischief has, however, been repeatedly occasioned by the changes that have been made in most countries in the weight, and sometimes also in the purity, of coins; and since the impolicy of these changes has been recognized, similar, and perhaps still more extensive, discords have sprung from the improper use of substitutes for coins. It is, indeed, quite obvious, that no change can take place in the value of money without proportionally affecting the pecuniary conditions in all contracts and agreements. Much, however, of the influence of a change depends on its direction. An increase in the value of money is uniformly more prejudicial, in a public point of view, than its diminution; the latter, though injurious to individuals, may sometimes be productive of national advantage; but such can never be the case with the former. See *Principles of Political Economy*, by McCULLOCH, 3d ed., pp. 510-515.

No certain estimate can ever be formed of the quantity of money required to conduct the business of any country; this quantity being, in all cases, determined by the value of money itself, the services it has to perform, and the devices used for economizing its employment. Generally, however, it is very considerable; and when it consists wholly of gold and silver, it occasions a very heavy expense. There can, indeed, be no doubt that the wish to lessen this expense has been one of the chief causes that have led all civilized and commercial nations to fabricate a portion of their

money of some less valuable material. Of the various substitutes resorted to for this purpose, paper is, in all respects, the most eligible. Its employment seems to have grown naturally out of the circumstances incident to an advancing society. When government becomes sufficiently powerful and intelligent to enforce the observance of contracts, individuals possessed of written promises from others that they will pay certain sums at certain specified periods, begin to assign them to those to whom they are indebted; and when the subscribers are persons of fortune, and of whose solvency no doubt can be entertained, their obligations are readily accepted in payment of debts. But when the circulation of promises or bills in this way has continued for a while, individuals begin to perceive that they may derive a profit by issuing them in such a form as to fit them for being readily used as a substitute for money in the ordinary transactions of life. Hence the origin of bank notes. An individual in whose wealth and discretion the public have confidence, being applied to for a loan, say \$5000, grants the applicant his bill or note, payable on demand, for that sum. Now, as this note passes, in consequence of the confidence placed in the issuer, currently from hand to hand as cash, it is quite as useful to the borrower as if it had been gold; and supposing that the rate of interest is 5 per cent., it will yield, so long as it continues to circulate, a revenue of \$250 dollars a year to the issuer. A banker who issues notes, coins, as it were, his credit. He derives the same revenue from the loan of his written promise to pay a certain sum, that he could derive from the loan of the sum itself, or of an equivalent amount of produce! And while he thus increases his own income, he, at the same time, contributes to increase the wealth of the public. The cheapest species of currency being substituted in the place of that which is most expensive, the superfluous coins are either used in the arts or are exported in exchange for raw materials or manufactured goods, by the use of which both wealth and enjoyments are increased. Ever since the introduction of bills, almost all great commercial transactions have been carried on by means of paper only. Notes are also used to a very great extent in the ordinary business of society; and while they are readily exchangeable, at the pleasure of the holder, for coins, or for the precise quantities of gold or silver they profess to represent, their value is maintained on a par with the value of these metals; and all injurious fluctuations in the value of money are as effectually avoided as if it consisted wholly of the precious metals.

In common mercantile language, the party who exchanges money for a commodity is said to buy; the party who exchanges a commodity for money being said to sell. Price, unless where the contrary is distinctly mentioned, always means the value of a commodity estimated or rated in money. For a further account of metallic money, see the article COIN.

See *Bankers' Mag.*, v., 309, 384, ii., 1, 641; HUNT'S *Mag.*, i., 50 (C. F. ADAMS); *Ed. Rev.*, x., 284, xiii., 35, xxiii., 568; *West. Rev.*, ix., 99; DE BOW'S *Rev.*, vi., 243, vii., 501.

Monopoly. By this term is usually meant a grant by competent authority, conveying to some one individual, or number of individuals, the sole right of buying, selling, making, importing, exporting, etc., some one commodity, or set of commodities. Such grants were very common previously to the accession of the house of Stuart, and were carried to a very oppressive and injurious extent during the reign of Queen Elizabeth. Commercial monopolies reached to such a height in England, that Parliament petitioned against them, and they were in consequence mostly abolished about the close of Elizabeth's reign, 1602. They were further suppressed, as being contrary to law, 19 James I., 1622; and were totally abolished, and it was decreed that none should be in future cre-

ated, as was previously the custom, by royal patent, 16 Charles I., 1640.—ANDERSON'S *History of Commerce*. The grievance became at length so insupportable, that, notwithstanding the opposition of government, which looked upon the power of granting monopolies as a very valuable part of the prerogative, they were abolished by the famous act of 1624. The act of James I. declared that all monopolies, grants, letters patent for the sole buying, selling, and making of goods and manufactures, shall be null and void. It excepts patents for 14 years for the sole working or making of any new manufactures within the realm, to the true and first inventors of such manufactures, provided they be not contrary to law, nor mischievous to the State. It also excepts grants by act of Parliament to any corporation, company, or society, for the enlargement of trade, and letters patent concerning the making of gunpowder, etc. This act effectually secured the freedom of industry in Great Britain; and has done more, perhaps, to excite the spirit of invention and industry, and to accelerate the progress of wealth, than any other in the statute book.

Monsoons (from the Malay *musin*, season), periodical trade winds, which blow six months in one direction, and the rest of the year in an opposite one. They prevail in the Indian Ocean north of the 10th degree of south latitude. From April to October a violent south-west wind blows, accompanied with rain, and from October to April, a gentle dry north-east breeze prevails. The change of the winds or the *breaking up* of the monsoons, as it is called, is accompanied by storms and hurricanes. These periodical currents of winds do not reach very high, as their progress is arrested by mountains of a moderate height.

Monsoons are, for the most part, formed of trade-winds. When at stated seasons of the year a trade-wind is deflected in its regular course from one quadrant to another, or drawn in by overheated districts, it is regarded as a monsoon. Thus the African monsoons of the Atlantic, the monsoons of the Gulf of Mexico, and the Central American monsoons of the Pacific, are, for the most part, formed of the trade-winds, which are turned back or deflected to restore the equilibrium which the over-heated plains of Africa, Utah, Texas, and New Mexico have disturbed. When the monsoons prevail for five months at a time, for it takes about a month for them to change and become settled, then both they and the trade-winds, which they replace, are called monsoons. The north-east and the south-west monsoons of the Indian Ocean afford an example of this kind. A force is exerted upon the north-east trade-winds of that sea by the disturbance which the heat of summer creates in the atmosphere over the interior plains of Asia, which is more than sufficient to neutralize the forces which cause those winds to blow as trade-winds; it arrests them; and were it not for the peculiar conditions of the land about that ocean, what are now called the north-east monsoons would blow the year round; there would be no south-west monsoons there; and the north-east winds, being perpetual, would become, all the year, what in reality for several months they are, viz., north-east trade-winds.

As long ago as 1831, Dove maintained that the south-west monsoon was the south-east trade-wind rushing forward to fill the vacant places over the northern deserts. Dove admits the proofs of this to be indirect, and acknowledges the difficulty of finding out and demonstrating the problem.—*Annalen der Physik*, No. 94. Translated by Dr. Rosengarten for the *American Journal of Science*, vol. xx., 60.

The north-east and south-east trade-winds meet, we know, near the equator, where they produce the belt of equatorial calms. All vessels that pass from one system of trade-winds to the other have to cross this calm belt. Sometimes they clear it in a few hours. Sometimes they are delayed in it for weeks; and the

calm is so still and the rain so copious that the fresh water is sometimes found standing in pools on the sea. If it be true, as Dove maintains, that the south-west monsoons of the Indian Ocean are the south-east trade-winds of that sea pressing up toward the desert regions of Asia, then a vessel bound hence to Calcutta, for instance, and entering the Indian Ocean at the time of the south-west monsoon, should find no belt of equatorial calms there at all, but, on the contrary, she should find the south-east trade-wind to haul more and more to the south, until finally, without having crossed any belt of equatorial calms, she would find her sails trimmed to the south-west monsoon. In like manner, Jansen maintains that the north-west monsoon is a similar deflection of the north-east trade-wind.

The Desert of Cobi and the arid wastes of Asia are the cause of the monsoons of the Indian Ocean. When the sun is north of the equator, the force of his rays, beating down upon these wide and thirsty plains, is such as to cause the vast superincumbent body of air to expand and ascend. Consequently, there is an indraught of air from the surrounding regions to supply the ascending column. The air that is going to feed the north-east trades is thus arrested, drawn in, heated, and caused to ascend; and so, the north-east trade-winds are first weakened, then "killed," and afterward drawn into the vortex of ascending air over the burning sands of the deserts; on the other hand, the south-east trade-wind, failing, when it arrives at the place where the equatorial Doldrums were wont to be, to meet with them or any opposing force from the north-east trades, are drawn over into the northern hemisphere. Going now from the equator toward the poles, their tendency is to obey the forces of diurnal rotation, as well as those of the indraught for the heated plains, and thus the south-east trades become south-west monsoons. In this view, the "equatorial Doldrums" of the Indian Ocean are transferred, as it were, during the south-west monsoons, to the deserts of central Asia. It may be asked by some, saying, Since we can not always tally the air, how do we know that these south-west monsoons are the south-east trades of the Indian Ocean? The reply is, We infer that they are, because in co-ordinating for the Pilot Chart of that sea we have found no belt of calms between the south-east trades and the south-west monsoons, but a gradual change, so to speak, of the one wind into the other. Thus, confining ourselves to August—one of the south-west-monsoon months—and to the strip of ocean between 85° and 90° east, the investigation gives as follows for calms and winds in the field between: 10° S. and 5° S. 133 observations, wind south-east. 5° S. and 102 observations, 3 calms, wind south. 5° N. 99 observations, 3 calms, wind south-west. 5° N. and 10° N. 77 observations, wind south-west. These monsoons do not, as we are generally taught to suppose, commence or end at the same time all over the Indian Ocean. In the first field below Calcutta, *i. e.*, between the land and 20° N., the north-east trade-winds, toward the latter part of January, begin their conflict with the south-west monsoons. The conflict rages in February, and by March the south-west monsoons in that "field" are considered to have regularly set in. They now remain the dominant wind for upward of six months, and until some time in the early part of September. The north-east monsoons or trades now renew the conflict, which is carried on with more and more vigor until the latter part of November, when they obtain the ascendancy, and prevail until the latter part of January, when, as before stated, the south-west monsoons commence their annual struggle for the mastery. In the next field below, *i. e.*, between 15° and 20° N. lat., the north-east monsoons begin to grow light and variable, and to have conflicts with the south-west in February. The period of this conflict, or change, as it is called, frequently lasts until some time in March,

when the force that is calling in and driving the monsoons from the south-west finally gains the ascendant. They then blow steadily until late in September, when the north-east trade-wind forces begin again to assert their ascendancy and to renew the conflict on this side through October, by which time the north-east trades or monsoons become the prevailing winds. Thus, by going 200 or 300 miles further from the supposed place of heat and rarefaction that give rise to this system of winds, the duration of the north-east monsoons is prolonged nearly a month; for in this "field" they prevail from November to January inclusive, three months, while the south-west last from about the middle of March to the middle of September, say six months. In the next field below, *i. e.*, between the parallels of 10° and 15° the south-west monsoons blow about five months, perhaps not quite so long; they do not commence as early, nor blow so late as in the "field" above. They begin the conflict with the north-east trade-wind forces in the latter part of March, and gain the ascendant in May. They then prevail till October, when the north-east trade-wind forces, escaping from the heated plains of the interior, begin to renew the annual combat which is to get them the victory. They soon achieve it, and maintain the mastery undisputed till the last of March or first of April.—MAURY, *Phys. Geog. of the Sea.*

Changing of the Monsoons.—Lieutenant Jansen thus describes this phenomenon: "We have seen that the calms which precede the sea-breeze generally continue longer, and are accompanied with an upward motion of the air; that, on the contrary, those which precede the land-breeze are, in the Java Sea, generally of shorter duration, accompanied by a heavy atmosphere, and that there is also an evident difference between the conversion of the land-breeze into the sea-breeze, and of the latter into the former. Even as the calms vary, so there appears to be a marked difference between the changing of the monsoons in the spring and in the autumn in the Java Sea. As soon as the sun has crossed the equator, and its vertical rays begin to play more and more perpendicularly upon the northern hemisphere, the inland plains of Asia, North Africa, and of North America are so heated as to give birth to the south-west monsoons in the China Sea, in the North Indian Ocean, in the North Atlantic, and upon the west coast of Central America; then the north-west monsoon disappears from the East Indian Archipelago, and gives place to the south-east trade-wind, which is known as the east monsoon, just as the north-west wind, which prevails during the southern summer, is called the west monsoon. This is the only monsoon which is found in the southern hemisphere, while in the northern hemisphere the north-east trade-wind blows in the China Sea and in the Indian Ocean; in the East Indian Archipelago the west monsoon prevails; and here, when the south-east trade blows as the east monsoon, we find the south-west monsoon in the adjacent seas of the northern hemisphere. Generally the westerly monsoons blow during the summer months of the hemisphere wherein they are found. As the land-breeze daily destroys in miniature the regular flow of the trade-wind, so does the latter the west monsoon in larger measure, and observations will be able to decide whether monthly disturbances do not also take place. In the Java Sea, during the month of February, the west monsoon blows strong almost continually; in March it blows intermittently, and with hard squalls; but in April the squalls become less frequent and less severe. Now the changing commences; all at once gusts begin to spring up from the east: they are often followed by calms. The clouds which crowd themselves upon the clear sky give warning of the combat in the upper air which the currents there are about to wage with each other."

Montevideo, a sea-port, and the capital of the Republic of Uruguay, on the north bank of the Rio de

la Plata, lat. $34^{\circ} 54' 11''$ S., long. $56^{\circ} 13' 18''$ W. The population, which is variously estimated, may probably be about 12,000. The town is built in the form of an amphitheatre, on a regular plan, and is well fortified. It has suffered much from the various revolutions to which it has been subject during the last 80 years. Montevideo is situated $2^{\circ} 3' 33''$ W. of Cape St. Mary, the northern limit of the embouchure of the La Plata. Vessels from the north bound to Montevideo generally make this cape, entering the river between it and the small island of Lobos, in from 14 to 17 fathoms. The course is thence nearly west to the Isle of Flores, on which is a light-house 112 feet above the level of the sea, with a revolving light. From Flores to Montevideo is 16 miles in a direct line, and the course west by south by compass. A light-house, 475 feet above the level of the sea, has been erected on the summit of the Montevideo, whence the town has its name. The latter is built on a projecting tongue of land, the port being on its south side. This, which is the best on the La Plata, is a large circular

basin, open to the south-west. Generally the water is shallow, not exceeding from 14 to 19 feet; but the bottom being soft mud, vessels are seldom damaged by grounding. It should, however, be observed that the depth of water in the harbor, as well as throughout the whole of the Rio de la Plata, depends very much on the direction and strength of the winds. The south-west wind, called *pamperos*, blows right into the Bay of Montevideo with much force, not unfrequently causing a rise of a fathom or more in the depth of water! But it rarely occasions much damage to vessels properly moored with anchors to the south-west, south-east, and one to the north. (BLUNT'S *American Pilot*, edit. 1857; *Coulier sur les Phares*, etc.) Montevideo has a considerable commerce. The great articles of export consist of animal products, or of hides, beef, tallow, hair, bones, grease, wool, etc. The imports principally consist of British cottons, woollens, and hardware, flour, wine and spirits, linens, sugar, tobacco, boots and shoes, salt, etc. The following shows the exports from these ports for five years:

Duties on Imports, in National or Foreign Vessels, at Montevideo.—1. Machinery, agricultural implements, instruments used in the arts and sciences, books, prints, and maps, free. 2. Silk, raw and wrought, laces, blonde, gold and silver embroidery, watches, jewelry, saltpetre, plaster of Paris, coal, timber, cotton fringe, and wooden hoops, 5 per cent. 3. Powder, pitch, tar, rosin, and naval stores, 13 per cent. 4. All raw materials, and manufactured articles, not included in the preceding enumeration, 15 per cent. 5. Sugar, Paraguay and China teas, cocoa, cassia lignea, and cinnamon, spices, drugs, and provisions in general, 20 per cent. 6. Furniture, pictures, looking-glasses, musical instruments, all sorts of carriages, carts, etc., and harness, saddles, horses' furniture (excepting horse cloths of the manufacture of the adjacent provinces, which pay 15 per cent.), ready-made clothes, boots and shoes, liqueurs, brandy, wine, vinegar, ale and porter, cider, tobacco, and soap, 25 per cent. Salt, 2 reals the fanego, say 11d. per 290 pounds. 7. Hides of all classes, hair, horns, tallow, silver and gold, in bullion or coin, free. A small charge is made for warehousing and portorage on passing through the custom-house. Goods may be bonded for an indefinite period, during which time they are subject to a moderate warehouse rent. Foreign flour pays as follows: \$8 per barrel, when wheat is worth \$2 to \$3 per fanega, about 224 pounds; \$6 per barrel, when wheat is worth \$3 to \$5; \$4, when wheat is worth \$5 to \$7; \$2, when wheat is worth \$7 to \$9; \$1, when wheat exceeds \$9. Wheat: \$3 per fanega, when wheat is worth \$2 to \$3 per fanega; \$2, when wheat is worth \$3 to \$6; \$1, when wheat is worth \$6 to \$10; nothing, when wheat is worth above \$10 per fanega; goods transhipped, or shipped out of bond, pay 2 per cent. Foreign goods, shipped in vessels of less than 150 tons burden, for ports of the Uruguay and Paraguay, pay only 1 per cent. 8. All goods imported, paying duties, are subject to pay an additional 1 per cent. to the consulado; $\frac{1}{2}$ per cent. to the hospital; and for the extinction of copper money, 1 per cent additional on all goods that pay 5 per cent. (This has, much to the honor of the authorities and people, been already accomplished; but the duty is maintained for general purposes.) On all goods that pay 13, 15, and 20 per cent., 3 per cent. On all goods that pay 25 per cent., 5 per cent. On flour, 10 per cent. On wheat, 3 per cent.

Duties on Exports, in National or Foreign Vessels.—

Ox and cow hides, 2 reals, 25 centesimos, for reconnidor valuations of \$1, and 1 per cent. consulado. Horse hides, 1 real for reconnidor, on valuations of 5 reals for reconnidor each, and 1 per cent. consulado. All other produce of the country pays 4 per cent. on the market value, and 1 per cent. consulado. Jerked and salt beef, pork, etc.; also all foreign goods that have paid the import duty, free. Gold and silver, coined or in bullion, 1 per cent.

Port Charges.—Tonnage from beyond sea, foreign vessels, 3 reals; national vessels, 2 reals. During loading and unloading, both classes pay \$1 per day. Pratique, with pilot, foreign vessels, \$8; national vessels, \$4. Boat, with pilot, foreign vessels, \$2; national vessels, \$2. Without pilot, foreign vessels, \$4; national vessels, \$2. National and foreign vessels that neither discharge nor load cargo, and that do not remain more than six days, pay nothing; those that remain in the harbor more than six days pay one third of the above tonnage dues. National vessels, and vessels belonging to the provinces of Buenos Ayres, employed within the River Platte, called coasting, pay for a license for each voyage, if 3 to 7 tons, 4 reals; 8 to 15 tons, 10 reals, or \$1 02; 16 to 30 tons, 18 reals, or \$2 02; 31 to 45 tons, 26 reals, or \$3 02; 46 to 60 tons, 30 reals, or \$3 06; 61 to 80 tons, 38 reals, or \$4 06; 81 to 100 tons, 46 reals, or \$5 06; 101 and above, 54 reals, or \$6 06.

Hospital Dues.—National and foreign vessels, sailing for a foreign port beyond sea or in the River Platte, pay \$2 for the vessel, 4 reals for the captain, 2 reals for each seaman, \$1 for each passenger.

Pilotage from Montevideo to Buenos Ayres to be paid in Montevideo. If the draught of water do not exceed 9 feet, Burgos measure, \$50; 9 to 10 feet, \$60; 10 to 11 feet, \$70; 11 to 12 feet, \$80; 12 to 13 feet, \$100; 13 to 14 feet, \$120; 14 to 15 feet, \$140; 15 to 16 feet, \$160; 16 to 17 feet, \$190; 17 to 18 feet, \$220.

Monies, Weights, and Measures.—Paper money there is none. Current money, the Brazilian patacon and Spanish dollar; they pass for 960 centesimos. 100 cents make a real; 800 cents, or 8 reals, make a dollar; 960 cents, or 9 reals 60 cents, make $1\frac{1}{2}$ current dollar, or 1 hard dollar or patacon. Weights and measures same as those of Spain; for which, see CADIZ.

As regards the commerce of the United States with

Montevideo, we find it has much diminished of late years, which may be attributed to the late civil war of nine years' duration. The interior of the country, which formerly abounded in horned cattle, is now without a sufficiency to supply the "Estancias" for breeding those useful animals, millions of them having been destroyed for their hides alone in the course of the war before mentioned, by the troops of Generals Rozas and Oribe; and the consequence is, that little or no produce comes in from the country. Vessels from the United States with their outward cargoes proceed onward to Buenos Ayres, where they find return cargoes, which are easily obtained. Capitalists of late have turned their attention to agriculture, particularly to the cultivation of wheat and Indian corn, which flourish here in a high degree; and in the course of a few years this country will, probably, be enabled to supply Brazil with the article of flour in abundance, in exchange for coffee, sugar, tobacco, etc., articles of vast consumption. There is a fine opening here for a steam mill, for the grinding of wheat and corn, none as yet (September, 1854) having been introduced into this country, and it is worthy the attention of some of the enterprising citizens of the United States. Wind, and horse power for mills, are the only means used at present throughout the country; and although its streams of water are innumerable, that power has not been brought into action. The manufactures consist chiefly of soap, tallow candles, chocolate, and leather, the latter of very inferior quality, which may be attributed to the species of bark used in tanning. Steam navigation on the Rio de la Plata, and its tributaries, is gradually increasing. There are two steamers running regularly between this city and Buenos Ayres, and others to the Parana and Uruguay Rivers, carrying freight and passengers; however, it may be considered as yet in its infancy. The very high price of fuel is a serious obstacle to steam navigation in this quarter, as no coal mines are found here, and the coal used comes from England and the United States, at a very dear rate, and, in consequence, the steamers have not realized so profitable a business as was anticipated.

Port Charges on Foreign Vessels at the Rate of 800 Reis to the Montevidean Dollar.—Pilotage inward, \$10; mooring, \$4; tonnage duty, 300 reis per ton (say on 150, if not more), \$43 06; free of entry, if to discharge, \$8; stamps for ditto, \$12; custom-house officer \$1 per day while discharging and loading, say for 30 days, \$30; stamps, in case of loading, and on being dispatched, \$25 04; hospital fees, from \$4 to \$6, according to the number of hands on board the vessel, \$5; pilot to Franquia, \$4; bill of health, \$4 04; escribano's fees, if for balance of cargo, \$8, or if the vessel lade here, \$12. Spanish 127 to 1000 reis, or \$158 06 at 800 reis. Vessels are allowed to lay 12 days from arrival without entering at the custom-house, and may land samples, so as to dispose of a part or the whole of their cargoes.

Montreal, a city and river port of entry, Canada East, and the largest and most populous city and chief seat of commerce of British America. Situated on the left bank of the St. Lawrence, 142 miles in a direct line south-west of Quebec. Lat. 45° 30' north, long. 73° 25' west. Population, 1840, 27,297; in 1852, 57,716; 1854, 65,000. The site is not so commanding as that of Quebec, but it is in every other respect superior to that city. The position of Montreal, at the head of the ship navigation of the St. Lawrence, and near its confluence with the Ottawa, as well as its situation with respect to the city of New York, necessarily makes it one of the greatest emporiums of Canada. The harbor, though not large, is secure, and vessels drawing 15 feet water, may lie close to the shore. Its general depth is from 3 to 4½ fathoms. Its chief disadvantage consists in the rapid St. Mary, about one mile below the city wharves, which vessels often find it difficult to stem, without the aid of steam-tugs. To

obviate the obstructions in the navigation above Montreal, the Lachine Canal, 9 miles long, 20 feet wide, and 5 feet deep, was undertaken in 1821, and completed at an expense of £130,000. The communication with the opposite side of the river is carried on by several steam and other vessels; and during the summer a regular steamboat communication is kept up with Quebec. At this season vast rafts of timber come down and pass the city of Quebec; and scows, batteaux of about six tons, and Durham boats bring to Montreal the produce of Upper Canada. Neither is the trade of Montreal suspended in winter, like that of Quebec. Numerous sledges may be seen coming in from all directions with agricultural produce, frozen carcasses of beef and pork, firewood and other articles. Montreal is the centre of the commerce between Canada and the United States, carried on by Lake Champlain and the Hudson, and not only is it the dépôt of all the adjacent country, but most of the business done in Quebec is carried on by branches from the Montreal houses. See *Exports of Canada*, p. 853. The imports in 1853, amounted to £3,603,696, and the net amount of duties, £447,089. In the same year, 4885 vessels entered the port, of 491,928 tons burden. The wharves of this city are constructed in a manner unequaled upon this continent; the entire line of which is over two miles in length, and considerable additions (to meet the rapidly increasing trade of the city) will be speedily commenced. The Lachine Canal, with its locks and basins, is another of those public works of which the city may well be proud. The Champlain and St. Lawrence Railroad, commences at Brewsterville, opposite the city and connects with the lines to New York and Boston, at Rouse's Point, a distance of 43 miles. This road is now completed and the cars run daily. The Lachine Railroad connects the city, by a line of road 9 miles in length, with the village of that name. The continuation of this road from Caughnawaga till it connects with the Ogdensburg Road at Moers, is now complete, and the whole line is known as the Montreal and New York Railroad. The St. Lawrence and Atlantic Railroad, connecting Montreal with the city of Portland, a distance of 292 miles, is now complete. A line from Quebec to Melbourne, a distance of 100 miles, is also in course of construction, and will be completed in 1854. The Grand Trunk Railroad to connect Montreal with Kingston, Toronto, etc., is now in course of construction. The entire length of the road from Trois Pistoles to Sarnia, will be 1112 miles, and it will probably be completed in 1856. The Montreal and Bytown Railroad will pass through a fine district of country, and is in progress of construction. The length will be about 121 miles, and will be opened in 1856. *The Victoria Bridge.*—This splendid and useful structure is to cross the St. Lawrence from Point St. Charles to the south shore, a total length of 9437 feet, or somewhat over a mile and three quarters. It is to be built on the tubular principle, and will have a track for railroad cars in the centre, while on the outside of the tube there will be a balcony on each side, with a foot path for passengers. The bridge will rest on 24 piers and two abutments of limestone masonry, the centre span being 330 feet long, and 60 feet high from summer water level. The iron used in its construction will be the best boiler plate T iron, and the total cost of the work is to be £1,500,000 sterling, or \$7,500,000. Formerly this city was the head-quarters of the fur-trade, but its interest in it has greatly declined. It has establishments for the manufacture of cotton goods, India rubber, steam engines, railroad cars, axes, etc., cast iron foundries, distilleries, breweries, soap, candle, and tobacco manufactories, several ship-building establishments, etc.; various articles of hardware, linseed oil, floor-cloth, etc., are made in the city. The markets are abundantly supplied with flesh, fish, poultry, fruit, vegetables, etc. About three fourths of the population are

of French descent, the remainder consisting principally of emigrants from Great Britain.

A letter from the United States' Consul at Montreal, dated October 9, 1855, remarks:—"Since my last communication, the only material alteration between the trade of the two countries has been the ratification and adoption of the reciprocity treaty, which has proved, so far, at least, as has come under my observation, highly satisfactory to the provincial government, and to the people of Canada at large; and there is every appearance of its increasing in usefulness, to this country at least. It is, if I may be allowed to use the expression, commercially speaking, tantamount to annexation; while its beneficial effects have shown themselves in the increased value of farms and landed estates on this side of the line, and I am induced to believe, by careful observation, that there has been a corresponding advantage received by the

United States, particularly the larger sea-port towns. This treaty has been instrumental in doing much for the advantage of the carrying trade, by conveying the products of this province over the railroads and canals of the Union, thereby placing Canada and the lower provinces, so far as their trade is concerned, in the position of one of the States of the Union. There has been, since my last communication, hitherto alluded to, but one enactment on the part of the Canadian government in relation to the trade between the United States and Canada, which was to the effect that the governor in council had abolished the duty levied upon the original packages, containing products of the United States imported into this province, under the provisions of the reciprocity treaty."

The following figures will show the comparative importance of the trade of the principal cities of Canada :

CITIES.	IMPORTS.			EXPORTS.			DUTIES COLLECTED.		
	1853.	1854.	1855.	1853.	1854.	1855.	1853.	1854.	1855.
Quebec....	\$1,141,595	\$1,754,320	\$1,732,556	\$2,248,453	\$2,511,767	\$1,558,702	\$128,454	\$179,139	\$174,807
Montreal...	3,381,540	3,816,082	3,061,061	1,888,728	572,514	475,650	449,102	478,603	310,219
Toronto....	1,165,056	1,362,706	1,401,454	221,490	273,040	404,105	156,083	172,576	152,586

The St. Lawrence, however, with all its acknowledged capacity, is not without its drawbacks. Foremost was the long winter, which sealed its waters during six months of the year; and next may be classed the dangers of a navigation of 700 miles between Belle Isle and Quebec. There were other circumstances which threatened that commercial prosperity which once appeared to be the undoubted appanage of the most convenient port of this large river—using the term "most convenient" in reference to breadstuffs, the chief produce of the West, and to manufactured goods, the chief article in demand by the West. The principal of these was the discovery that the most fertile lands lay beyond the barrier formed by Niagara. Hence, the population which would otherwise, in the natural order, have filled up the nearest land first, was tempted to the shores of Lake Erie and the country lying between that lake and the head waters of the Mississippi. It has been in this region that the great emigrant population has chiefly established itself, leaving the less fruitful shores of the St. Lawrence and Lake Ontario comparatively bare of inhabitants.

Imports to the Port of Montreal.—In 1845, £2,614,911; 1846, £2,303,908; 1855, £3,093,145; 1856, £3,993,000. The export trade generally has received a great impetus during the past year, owing in part, no doubt, to the establishment of the ocean steam line. The exports from Montreal for the first three quarters of the year 1855 were but £333,610; for the year 1856 they have amounted to £716,475, or more than double.

The population of the city is steadily increasing, and it is believed that at no former period was its trade and general business on a more healthy footing. In 1800, the population was 9000; 1816, 16,000; 1825, 22,000; 1831, 27,297; 1851, 57,715; 1856, 75,000, at a very moderate estimate.

Regulations in Force.—Merchandise shall not be unlaiden in Canadian ports except after due entry, at places designated for that purpose, under penalty of forfeiture. Merchandise shall not be imported except into some port at which a custom-house is established, under penalty of forfeiture of vessel and goods, if under the value of \$1000; if above that sum, they shall be retained as security for the payment of that amount.

Banks connected with Montreal.—Montreal being a large commercial centre, the banking facilities afforded to the business community are on an extended scale. The banks of Canada have been, on the whole, prudently and judiciously managed, and have proved remunerative to the shareholders, while there has yet been no instance of the stoppage of a Canadian bank. The names and capital of the banks carrying on their business in Montreal are here given, selected from the official statement, with a statement of whether the office be a head office or agency. These banks all, with one exception, transact business under Canadian charters, and their stockholders are liable in double the amount of their shares. The bank of British North America holds a royal charter, the head office being in London, but the principal colonial office is in Montreal.

BANKS ACTING UNDER CHARTER.—1856.

Name of Bank.	Capital authorized by act.	Capital paid up.
City B'k of Montreal, principal office.	\$1,200,000	\$1,047,000
Bank of Montreal, principal office...	6,000,000	5,278,000
Commercial Bank of Canada, agency.	4,000,000	2,976,000
Bank of Upper Canada, agency.....	4,000,000	2,698,000
Banque du Peuple, principal office....	800,000	795,000
Molson's Bank, principal office.....	1,000,000	824,000
Bank of British North America.....	5,000,000	5,000,000

A COMPARATIVE STATEMENT OF THE PRINCIPAL ARTICLES IMPORTED INTO CANADA DURING THE ELEVEN MONTHS ENDED DECEMBER 15TH, 1855 AND 1856.

Goods paying specific duty.....	\$1,885,910
" " 20 per cent.....	67,451
" " 12½ and 15 per cent.....	5,225,638
" " 2½ to 5 per cent.....	719,159
Free goods.....	2,997,941

Total..... £10,896,096

The countries from which these imports came :

Great Britain.....	\$4,553,238
British North America.....	258,148
British West Indies.....	4,408
United States.....	5,676,127
Other foreign countries.....	404,138

The total amount of duty collected during the year 1856 was £1,127,220.

The following is a comparative statement of imports, exhibiting in contrast the value of, and amounts of duties collected on, goods entered for consumption in Canada during the years 1853, 1854, 1855, and 1856.

Whence imported.	Value.				Duty.			
	1853.	1854.	1855.	1856.	1853.	1854.	1855.	1856.
Great Britain.....	\$4,622,280	\$5,740,832	\$3,325,565	\$4,553,238	\$1,028,676	\$1,224,751	\$881,445	\$1,127,220
N. Amer. Colonies.	153,164	168,778	216,496	258,148

The following is the statement of the same inward:

Years.	Total.			Great Britain.		British colonies.		United States.		Other foreign countries.	
	Number.	Tons.	Men.	Number.	Tons.	Number.	Tons.	Number.	Tons.	Number.	Tons.
1856.....	1,494	550,578	18,976	641	358,526	508	47,196	71	32,849	247	112,092
1855.....	1,168	419,553	14,252	523	279,986	424	50,730	80	35,706	141	50,131
1854.....	1,890	705,342	24,401	1,051	501,488	499	58,825	138	35,401	207	64,628

The number of steamers built in Canada in 1856 was 22; their tonnage 3755. Sail vessels 26; their tonnage 41,584. Total number of vessels built 148; their tonnage 45,339.

Summary of the Regulations in force at the different Ports in Canada.—Merchandise shall not be unladen, except after due entry, at places designated for that purpose, under penalty of forfeiture. Merchandise shall not be brought or imported into the province, whether by sea, land, coastwise, or by inland navigation, whether dutiable or not, except into some port or place at which a custom-house is or may be established, under penalty of forfeiture of vessel and goods, if under the value of \$1000; if above that sum, then

The nett comparative revenue from custom duties for the past five years, after deducting cost of collection, return duties, and balances, is as follows:

1852.....	£705,814	1855.....	£218,819
1853.....	986,597	1856.....	1,028,905
1854.....	1,168,018		

The following is a statement of the tonnage inward and outward, showing the amount of coasting and ferriage on Canadian inland waters, and the intercourse by inland navigation between Canada and the United States during the year 1856:

Total outward.....	Tons. 6,046,888
“ inward.....	6,199,829
Total.....	12,246,667

The following is a subdivision of this grand total:

Canadian steam....	6,287,397	American steam....	4,768,326
“ sail.....	890,726	“ sail.....	846,218

The following tables exhibit the number of vessels entered outward for sea, their tonnage, number of men employed, and the countries whence they came, during the year 1856, and the two preceding years:

the vessel and goods shall be retained as security for the payment of that amount. This applies, *mutatis mutandis*, to goods brought into the province, by land, in carriages or other vehicles. Other regulations have reference, principally, to frontier smuggling, and to the duties and powers of the officers charged with its prevention. They convey no general commercial information, and are, therefore, omitted. Most of the articles on which a discrimination in favor of importations from Great Britain exists, are embraced in the third article (“schedule”) of the Reciprocity Treaty. The foregoing regulations, etc., apply, with some slight modifications, to all the other colonial possessions of Great Britain in North America.

COMMERCE OF THE UNITED STATES WITH CANADA, FROM JULY 1, 1848, TO JULY 1, 1856.

Years ending	Exports.			Imports.		Whereof there was in Bullion and Specie.		Tonnage Cleared.

Moor, in navigation, signifies generally to fix a vessel by two anchors in nearly opposite directions, so that she *rides* by either in certain winds, or partly by both in other winds. Also, to secure a vessel to weights or chains sunk in harbors for the purpose. These weights are called *mooring blocks*, and the whole apparatus, *moorings*.

Morocco, or **Maroquin** (Ger. *Saffian*; Fr. *Marroquin*; It. *Marrocchino*; Sp. *Marroqui*; Rus. *Safian*), a fine kind of leather prepared of the skins of goats, imported from the Levant, Barbary, Spain, Flanders, etc. It is red, black, green, yellow, etc. It is extensively used in the binding of books. See LEATHER.

Morocco. In Africa generally, barbarism, with all its attendant evils—ignorance, superstition, and cruelty—still characterize not only the several governments, but most of the countries of Africa, if we except Egypt, the European settlements, and the republic of Liberia. Balbi, the distinguished Venetian geographer, in his great work, *Balance Politique du Globe*, remarks: “The title of African statistics may be rejected as absurd,” and, hence, he persisted for a long time in his determination of excluding Africa, Oceania, and the greater part of Asia, from consideration. Since Balbi composed his work, however, civilization has made encouraging progress in some

portions of western Africa. Point Gallenas has been brought within the limits, and under the humanizing influences, of a young, vigorous, and Christian republic. Where the slave factories once stood, pulpits are now erected; and savage tribes, and barbarous chiefs, instead of warring with each other for human plunder, have cast away the implements of carnage, and now seek a common protection in the plow and the gospel. Geographically, Macgregor divides Africa into seven great regions:

1st. The region of the Nile, under which may be comprised Egypt, Nubia, and Kordofan. 2d. The region of the north, situated between the Mediterranean and the great desert of Sahara, and extending from Egypt west to the Atlantic, generally known as the States of Barbary—namely, Morocco, Tunis, and Tripoli. The soil and climate of this region are eminently favorable to the culture and growth of the choicest productions. 3d. The third region comprehends the vast desert of Sahara, west from Fezzan and Darfour to the Atlantic, and south from the Barbary States to Senegambia, Soudan, and Bornou. 4th. The fourth region comprehends Nigritia, or western Africa, extending from the south boundary of the western desert to the south boundary of Benguela, in about latitude 16° south, including the republic of Liberia. 5th. The fifth region comprehends the Cape of Good Hope colony; the country of the Caffres and Hottentots; and the extensive dry desert coast north of the Hottentot country, to Benguela, and the great unknown southern desert. 6th. The sixth region, or eastern Africa, extending along the sea-coast, and to an unknown inland limit, from Delagoa Bay, in latitude 26° south, to the frontiers of Abyssinia. 7th. The seventh region comprehends the States of Abyssinia and Somaalia, extending from Cape Ras-asser, or Guardafui, to Zeylah, and along the Red Sea to the territories of the Pacha of Egypt.

Of the seven divisions thus given by Macgregor, the 1st, 4th, 5th, and 6th, only, possess any commercial importance: the first, comprising the Barbary States; the fourth, the republic of Liberia; the fifth, the colony of Good Hope (some account of which will be found in the Digest of British Colonial Possessions); and the sixth, the African possessions of the Sultan of Muscat, including the Island of Zanzibar.

Barbary States.—Under the collective denomination of Barbary States, are grouped together the countries which form the northern coast of Africa, viz.: Morocco, Tunis, and Tripoli. Prior to the submission of Algeria to the French arms, this division was also comprehended under the same general name. Being now a French colony, it is included in the Digest of French Colonial Possessions.

Empire of Morocco.—Morocco is one of the most powerful of the Barbary States, and comprises an area of 220,000 square miles, with a population estimated at 8,500,000. Although agriculture is in the most backward state, the soil yields, in great abundance and of the finest quality, wheat, barley, maize, olives, hemp, and cotton; and lemons, grapes, figs, oranges, almonds, and various fruits are grown in the greatest profusion. The sugar-cane, the tobacco-plant, and the date-tree thrive wherever they are cultivated. Under a liberal government, and with ordinary industry, Morocco could be made one of the most productive countries in the world. Islamism, however, wherever it extends, spreads its withering blight over every branch of industrial improvement. Among the varied physical resources are mines of iron, tin, copper, antimony, and salt; the last of which only appear to be worked. Two treaties of peace, friendship, etc., and for the security of persons and property, have been concluded by the United States with Morocco; the former bearing date January, 1787, and the latter, September, 1836. The principal stipulations

relating to trade and commerce, in the treaty of 1836, are embodied in the following summary:

Article 8. If any vessel of the United States shall meet with a disaster at sea, and put into one of our ports to repair, she shall be at liberty to land and reload her cargo without paying any duty whatever. 14. The commerce with the United States shall be on the same footing as is the commerce with Spain, or as that with the most favored nation for the time being; and their citizens shall be respected and esteemed, and have full liberty to pass and repass our country and sea-ports whenever they please, without interruption. 15. Merchants of both countries shall employ only such interpreters and such other persons to assist them in their business as they shall think proper. No commander of a vessel shall transport his cargo on board another vessel; he shall not be detained in port longer than he may think proper; and all persons employed in loading or unloading goods, or in any other labor whatever, shall be paid at the customary rates, not more and not less. 17. Merchants shall not be compelled to buy or sell any kind of goods but such as they shall think proper, and may buy and sell all sorts of merchandise but such as are prohibited to the other Christian nations. 18. All goods shall be weighed and examined before they are sent on board; and, to avoid all detention of vessels, no examination shall afterward be made, unless it shall first be proved that contraband goods have been sent on board; in which case the persons who took the contraband goods on board shall be punished according to the usage and custom of the country, and no other person whatever shall be injured, nor shall the ship or cargo incur any penalty or damage whatever. 19. No vessel shall be detained in port on any pretense whatever, nor be obliged to take on board any article without the consent of the commander, who shall be at full liberty to agree for the freight of any goods he takes on board. The treaty to continue in force 50 years, with the usual 12 months' notice after the expiration of that period.

The principal ports of Morocco are Mogadore, on the Atlantic, with a safe harbor for vessels of 150 tons; Tangier, Tetuan, Dar al Baida, Mazagan, Safi, Rabat, and Laroche. The import duties are often arbitrarily raised, and frequently corruptly levied. With the exception of cochineal, coffee, cotton, iron, raw silk, sugars, and tea, on which articles there are specified duties, and tobacco, which can be sold only to the temporary assignees of the emperor's monopoly, a general duty of 10 per cent. is levied on all imports. When thus sold, it is admitted free; the price of the monopoly varying according to the number of bidders, but usually reaching as high as \$100,000. The assignee realizes from nett sales about \$180,000. Besides tobacco, the sultan reserves the monopoly of brimstone, gunpowder, and lead. Every article entering into the export trade of Morocco is subject to arbitrary, and frequently oppressive duties. On leeches and cork-bark the sultan retains the monopoly, which is annually sold to the highest bidder, and sometimes adds to the sultan's revenue as much as \$100,000 per annum. If we compare this large amount with the total value of these articles annually exported, viz.: leeches \$120,000, cork-bark \$110,000 (about 50 per cent. of which is paid for the monopoly), it can be seen at once how much the trade in these articles is affected by these burdensome internal taxes. Morocco maintains an extensive trade with the interior of Africa by caravans, the principal of which usually accompanies the pilgrims across the whole continent of Africa to the Red Sea, and the tomb of Mohammed, and Mecca. The value of the investments in this caravan has been usually estimated at \$2,000,000. The caravans trading with the interior depart from Tetuan, Morocco, and Fez, and meet at Taflet, in order to cross together the great desert of Sahara. The trade between the United States and the empire of

Morocco is principally indirect, through the ports of Marseilles and Gibraltar, and is conducted for the most part in French and British bottoms. It is suggested to the Department of State, by the United States' consul at Tangier, that this carrying trade could be secured to American vessels if our import duties on produce in general of Morocco, especially on coarse wool, were reduced to the same standard that rules in England. In 1853 the carrying export trade of the United States to Morocco, amounting to \$84,000, was entirely effected in foreign vessels. In 1852, of the 474 vessels of all sizes, measuring an aggregate of 30,426 tons, engaged in the foreign trade of the empire, there were but four American vessels, measuring in all 1,100 tons. The imports into the United States from Morocco consist of coarse wool, gums, skins, ostrich feathers, etc. The exports from the United States to Morocco are raw cotton, coarse domestics, brown sugar, rice, and tobacco. The latter article is supplied almost exclusively from the United States.

In 1848 the maritime commerce of Morocco reached 15,046,979 francs (\$2,798,738), viz.:

	Imports. Francs.	Exports. Francs.
Merchandise.....	8,747,504	5,689,275
Specie.....	253,800	356,400
Total.....	9,001,304	6,045,675

In this general movement the returns assign to the port of Mogadore amounts as follows: Imports, 2,281,088 francs; exports, 2,584,804 francs; total, 4,865,842 francs. See *MOGADORE*, ante, p. 1368.

This leaves 10,181,137 francs for the other ports—Mazagan, Tangier, Tetuan, Dar al Baida, Laroche, and Rabat.

For the purpose of comparison, the general movements for 1847 are given as follows: Imports, 7,077,208 francs; exports, 6,910,946 francs; total, 13,988,154 francs.

Compared with 1846, these figures show a diminution of 390,547 francs; but when compared with the returns for 1848, they exhibit an increase of 1,058,825 francs, exclusively on imports. The diminution principally affects the trade with France; thus, in 1847, the trade of this country with Morocco amounted to 2,814,154 francs—(imports 520,965, exports 1,793,189)—while in 1848 it fell to 1,656,886 francs—(imports 404,906, and exports 1,251,480)—showing a decrease of 657,768 francs. With every other country engaged in this trade there was an augmentation in 1848, both in imports and exports. In one article, rather suspiciously called "Americanos," England largely augmented her export trade to Morocco—the whole increase in 1848 being upward of \$1,500,000. This description of merchandise is thus explained in an official dispatch transmitted to the Department of State from Tangier: "Throughout the whole empire, from the sultan down to the lowest subject, the article which we call 'coarse domestics' is used under the appellation of *Americanos*. It is the principal article of import, and is an imitation, by the manufacturers of Manchester, England, of the coarse domestics of Massachusetts. * * * * It took with the Moors, who were so enthusiastic in their praise of it, that the English manufacturers dispatched an agent to this country to examine and report on the fabric, and the probable demand. They then set to work to

manufacture an article in every respect similar; and, stealing the name, they managed to undersell our countrymen and monopolize the market." The tabular statements that follow, giving a condensed view of the trade and navigation of Morocco, are brought down to the latest period for which authentic data are accessible. They are compiled from French official publications:

TABULAR STATEMENT EXHIBITING THE TRADE OF MOROCCO FOR 1848, COMPARED WITH 1847.

Ports.	Imports.		Exports.	
	1847.	1848.	1847.	1848.
	Francs.	Francs.	Francs.	Francs.
Tangier.....	1,695,000	2,904,000	1,102,000	1,090,000
Tetuan.....	1,086,000	1,829,000	586,000	459,000
Laroche.....	561,000	1,187,000	320,000	251,000
Rabat.....	935,000	229,000	648,000	898,000
Dar al Baida..	875,000	428,000	1,157,000	929,000
Mazagan.....	340,000	143,000	817,000	886,000
Mogadore.....	2,085,000	2,281,000	2,830,000	2,585,000
Total.....	7,077,000	9,001,000	6,910,000	6,045,000

Official returns give to England the principal share of this trade—an advantage which she enjoys, partly because of the proximity of Gibraltar, but mainly because she monopolizes the large bulk of the carrying trade between the United States and Morocco.

The imports, these years, consisted of cottons (*Americanos*) and woolen cloths, raw silk, iron, steel, copper and lead, sugar, coffee, grains, drugs, hardwares, tea, and specie; the exports were wool, hides and skins, leeches, gum, olive-oil, Morocco leather, and ostrich feathers. The general commerce of the Mediterranean in 1854 increased materially over that of 1853; the increase was chiefly with Spain, Morocco, Sardinia, the United States, and Tuscany.

Navigation.—The following table exhibits the navigation of the ports of Morocco in 1850:

Nationality.	No. of vessels.	Tonnage.
England.....	612	38,655
France.....	157	18,089
Spain.....	49	1,889
Portugal.....	32	2,129
Turkey.....	14	1,840
Other countries.....	18	1,523
Total.....	877	59,135

The principal imports are cotton goods of all kinds, cloth, silk stuffs, velvets, copper, iron, steel, hardware, cochineal, indigo, and other dyes, tea, coffee, sulphur, paper, glass, beads, rum, etc. The exports consist in hides, wax, wool, leeches, dates, almonds, oranges, and other fruit, bark, fax, durra, woolen sashes, haicks, Moorish slippers, etc.

The following table exhibits the values of this trade during a period of five years ending with 1856:

Years.	Imports.	Exports.	Total.
1852.....	\$395,260	\$359,280	\$754,490
1853.....	416,965	382,150	799,115
1854.....	696,245	222,080	858,825
1855.....	662,120	255,750	917,870
1856.....	677,830	386,320	1,064,150
Total...	\$2,788,420	\$1,605,580	\$4,398,950
Average	\$557,684	\$321,106	\$878,790

That our commercial readers may see the share which Great Britain holds in the trade of Tangier, we subjoin a tabular statement showing the navigation of this port during the same period, distinguishing the number and tonnage of British vessels:

Years.	Entered.				Total.		Cleared.				Total.	
	British ships.		Foreign ships.				British ships.		Foreign ships.			
	Vessels.	Tons.	Vessels.	Tons.	Vessels.	Tons.	Vessels.	Tons.	Vessels.	Tons.	Vessels.	Tons.
1852...	159	4,599	102	2,896	261	7,495	159	4,599	100	2,844	259	7,443
1853...	176	7,261	174	8,853	350	15,614	176	7,261	172	8,191	348	15,452
1854...	187	12,846	128	5,924	265	18,730	186	12,826	128	5,934	264	18,760
1855...	153	12,397	90	3,213	243	15,610	153	12,397	87	3,198	240	15,595
1856...	203	10,833	110	4,780	313	15,668	207	10,984	110	4,790	317	15,714
Total.	828	47,986	604	25,176	1,432	73,162	881	48,017	597	24,857	1,428	72,904
Average	165	9,597	121	5,035	286	14,632	166	9,603	119	4,977	285	14,590

In 1853 the commercial movements at the port of Mogadore reached, imports and exports united, 10,592,245 francs; of which imports covered 4,984,220 francs, and exports 5,608,025 francs. In 1852 the total was only 6,920,525 francs; of which, for imports, there were 3,267,175 francs, and for exports 3,653,350 francs. There was, therefore, an increase in 1853 of, imports 1,717,045 francs, exports 1,954,675, making a total of 3,671,720 francs.

Navigation returns show that 57 vessels entered, measuring, in all, 7488 tons, viz.: England, 37; France, 9; Portugal, 2; Belgium, 1; Spain, 1; other nations, 7.

The trade of this port (Mogadore) in 1854 exhibits a total value of 5,946,095 francs; of which there was for imports 2,810,045 francs, and for exports 3,136,050 francs.

NAVIGATION OF MOROCCO IN 1848, COMPARED WITH THAT OF 1847.

Years.	Vessels		Total Tonnage.
	Entered.	Cleared.	
1848.....	297	225	28,346
1847.....	316	297	32,484
Decrease in 1848.	19	72	9,088

The general foreign commerce of the empire in 1849 and 1850 is shown by the following statement:

Years.	Imports.	Exports.	Total.
1849.....	\$2,106,200	\$1,683,200	\$3,789,400
1850.....	1,522,800	1,638,200	3,506,000

The commerce for these years was thus distributed between the ports of Morocco:

Ports.	Imports.		Exports.	
	1849.	1850.	1849.	1850.
	Francs.	Francs.	Francs.	Francs.
Tangier.....	2,136,000	1,614,000	1,549,000	1,048,000
Tetuan.....	2,497,000	523,000	1,115,000	517,000
Laroche.....	933,000	515,000	332,000	356,000
Rabat.....	1,387,000	1,804,000	477,000	1,145,000
Dar al Baida.....	716,000	840,000	1,625,000	1,116,000
Mazagan.....	63,000	495,000	348,000	410,000
Mogadore.....	2,756,000	8,323,000	2,970,000	3,792,000
Total.....	10,583,000	9,114,000	8,416,000	8,884,000

The following tabular statement shows the countries which participated in the trade of 1850:

Countries.	Imports.	Exports.	Total.
England.....	\$1,808,800	\$976,400	\$2,285,200
France.....	895,600	621,800	1,017,400
Spain.....	48,200	37,400	85,600
Portugal.....	47,400	7,800	55,200
Sardinia.....	28,000	28,000
Belgium.....	14,000	11,800	25,800
Austria.....	8,800	8,800
Total.....	\$1,822,800	\$1,638,200	\$3,506,000

The principal ports of Morocco are Tangier, Tetuan, Laroche, Rabat, Dar al Baida, Mazagan, and Mogadore. The town of Tangier occupies an eminence at the western extremity of a capacious bay, within the limits of the Straits of Gibraltar, and nearly opposite to the Spanish town of Tarifa. The peculiar advantages of its situation render it the most frequented port of Morocco. The town contains 900 houses, and about 8500 inhabitants—consisting of 6000 Moors, 2200 Jews, and 840 Christians. The inhabitants are, comparatively speaking, civilized and tolerant. Christians are treated with greater respect, and Jews with less severity, than in any other part of the empire—privileges for which they are indebted partly to the presence of the chief representatives of foreign powers and partly to the liberality of the present able and energetic Pasha, Sid Mohamed Ben Abd-el-Maleck.

Port Charges.—The port charges and dues are simply for anchorage, and vary from \$2 to \$25, with a gratuity to the port captain of from \$2 to \$4. This gratuity secures the services of this officer in obtaining abundant provisions and other supplies for the vessel, free of duty. The anchorage dues, as above,

range between the two extremes, according to the friendly or unfriendly terms which may subsist between the local authorities and the consul of the nation the flag of which the vessel may bear.—*Com. Rel. U. S.*

Consular Regulations with the United States.—It is stipulated by the 19th and the three following articles of the treaty concluded between the United States and Morocco, October 1, 1837, that if any of the citizens of the United States, or any persons under their protection, shall have any dispute with each other, the consul shall decide between the parties; and whenever the consul shall require any aid or assistance from the government of Morocco to enforce his decisions, it shall be immediately rendered to him. If a citizen of the United States should kill or wound a Moor, or, on the contrary, if a Moor shall kill or wound a citizen of the United States, the law of the country shall take place, and equal justice shall be rendered, the consul assisting at the trial; and if any delinquent shall make his escape, the consul shall not be answerable for him in any manner whatever. If an American citizen shall die in Morocco, and no will shall appear, the consul shall take possession of his effects; and if there shall be no consul, the effects shall be deposited in the hands of some person worthy of trust, until the party shall appear who has a right to demand them; but if the heir to the person deceased be present, the property shall be delivered to him without interruption; and if a will shall appear, the property shall descend agreeably to that will, as soon as the consul shall declare the validity thereof. The consul of the United States is permitted to reside in any seaport of the dominions of the emperor of Morocco that he shall think proper; and he shall be respected, and enjoy all the privileges which the consuls of any other nation enjoy; and if any of the citizens of the United States shall contract any debts or engagements, the consul shall not be in any manner answerable for them, unless he shall have given a promise in writing for the payment or fulfillment thereof; without which promise in writing no application to him for any redress shall be made.

Mortgage. A mortgage is a conveyance or transfer of real or personal estate to secure the grantee or assignee the payment of some debt or the performance of some agreement, with a condition or understanding that, in case of the debt being paid, or the agreement being performed, within a certain time, and in the specified manner, the conveyance or assignment shall be void, and the land or personal property revert to, or rather, still belong to the mortgager. The English, and so the American mortgage of land, is mostly borrowed from the civil law (see *KENT'S Commentaries*, vol. iv., part iv., lect. lvii.; *BROWN'S Civil Law*, vol. i., p. 200), or, at least, many of the rules and incidents of the Roman *hypotheca*, coincide with ours relating to mortgages. The essential characteristic of a mortgage, however, according to the import and definition of the term, must be the same in all countries, namely, that the property conveyed or transferred, whether real or personal, shall not absolutely go, and belong to the grantee or assignee, in case the debt intended to be secured shall be paid, or the contract, whatever it may be, intended to be guaranteed, shall be performed within the time and terms agreed upon. The rules and incidents of such a hypothecation will, therefore, have some resemblance under all codes of laws. There is no limitation of the kind of debts or contracts, the payment or performance of which may be secured by mortgage, for all legal ones may be so guaranteed. What will be a sufficient conveyance of the property, whether real or personal, will again depend on the laws of the place. A conveyance of land, for instance, must, in most countries, be made in writing, and with certain formalities. So, in England, the right of property in a ship must appear by a bill of

sale. Whatever these rules are by which the absolute transfer of property is regulated, they will equally apply to a conveyance or assignment by way of hypothecation. As real estate is usually required by the laws to be conveyed by written documents, and, according to the laws of most places, these conveyances are evidenced by public records of the instruments by which they are made, there is no necessity of an open, visible possession of the estate by the grantee, that the public may take notice of the grant, for they may find the evidence of it at the office of public record. The case is not the same with personal property, the title to which is usually confirmed and established to the purchaser by a delivery of the article into his possession. In respect to all chattels, of which manual possession and transfer from place to place is practicable, the delivery by the vender, and actual possession by the purchaser, are very material circumstances in establishing the right of property in the latter. It is, indeed, laid down as a maxim of the English, and also of the American law, that movables can not be validly sold or mortgaged without a delivery actual, or constructive, to the purchaser or mortgagee, and a possession by him. But this rule is very much modified and relaxed; not that a delivery to and a possession by the vendee and mortgagee are not considered requisite to establish his title, but a very liberal interpretation has been put upon circumstances showing a constructive delivery and possession. The object and policy of the law is to leave the movable, just as it does land, to be used either by the mortgager or mortgagee, without affecting their mutual rights and obligations as to the property in the thing, as far as this indulgence can be carried without leading other persons into a misapprehension, and exposing them to fraud and imposition in giving credit to the mortgager, upon the supposition of his being the absolute owner of the property hypothecated. The various rules and distinctions by which the mortgage of chattels is regulated in this respect, constitute an essential part of the law upon this subject. But, after all, we may lay it down as an essential doctrine, that a mortgaged chattel must be in possession of the mortgagee, in order to render his title secure; and when the mortgager has, by the law, been permitted still to use the thing, it is only in cases where his possession is, in legal construction, that of the mortgagee.

The most material consideration relating to mortgages, whether of lands or chattels, is the effect of the non-performance of the condition by the mortgager. This will depend, it is true, in part, upon the terms of the contract of hypothecation or mortgage. If it be agreed between the parties, that in case of non-performance of the condition of the hypothecation, the mortgagee shall sell the thing hypothecated, whether land or goods, and account to the mortgager for the proceeds in satisfaction of the debt, or discharge of the obligation, intended to be secured, and pay over the surplus, if any, this is all that justice or the law can demand, and this is, in effect, what the law aims at where the parties do not make any such stipulation; but, on the contrary, agree, either expressly or impliedly, that, in case of a non-performance of the condition, the thing mortgaged shall be absolutely and immediately forfeited to the mortgagee, without any right on the part of the mortgager to redeem it, or to call upon the mortgagee to sell it and account with him for the proceeds. Thus, in the common form of mortgaging land, it is conveyed to the mortgagee with a provision that unless he shall pay a certain debt, or do a certain thing within a time specified, the conveyance shall be void. According to the literal construction, therefore, if this condition is not complied with, the thing henceforth belongs absolutely to the mortgagee. But here the law steps in and controls the agreement, and attempts to prevent it from operating as a penalty or forfeiture, at the same time giving it all its force as a

security or guaranty. For this purpose, different modes are adopted in different codes of laws, all of which agree in applying the value of the thing mortgaged, in satisfaction and discharge of the debt or obligation intended to be secured; so that by all the codes justice is done, if there is no surplus value. But if there be a surplus value, some of the codes will reach it, and others not, and the same code will reach it in regard to one kind of pledge, mortgage, or hypothecation, and not another. For example, by the English and American law, if a debtor pledges bills of exchange, or any personal property for a debt, to an amount exceeding its value, the creditor must account for the proceeds, and pay over the surplus to the debtor; but in England, and so in some of the United States, if the debtor mortgages lands, of which the creditor takes possession for breach of condition, the debtor has three years to redeem it, after which time the land is absolutely gone, though twice the amount of the debt in value. The law, in this case, supposes three years to be time enough to allow the debtor to redeem it, in case of an excess of value of the land; and this supposition is not wholly unreasonable, since the debtor has all that time to sell the land if he can get more than the amount of the debt for it. The civil law, as more generally administered, where it has been made the basis of modern codes, and so the laws of many of the United States adopt a different mode, prescribing an appraisement of the mortgaged land, and providing that it may be sold by auction, if two thirds of the appraised value is bid for it, and the proceeds of the sale are applied in satisfaction of the debtor obligation guaranteed by the mortgage, and the surplus, if any, paid over to the debtor.—E. A.

Moss. *Iceland Moss* (*Cetraria Islandica*), a species of lichen, a native of the mountainous heaths and woods in the Alpine parts of Scotland, and of the Asturias, in Spain, as well as in Iceland and the north of Germany. It grows to a height of only two or three inches, and has rather a rugged, bushy appearance, and doubtless would thrive, and perhaps with profit, in the northern parts of the United States, particularly in Minnesota, Wisconsin, Michigan, northern New York, Vermont, New Hampshire, and Maine. In Iceland and Lapland, this plant is used as an article of diet, being boiled in broth or milk, after being freed from its bitterness by repeated maceration in water; or dried and made into bread. The dried plant differs but little from its appearance in a recent state. Medicinally, it is tonic and demulcent. The decoction, as ordered in the pharmacopœias, is so bitter as to prevent many persons from taking it; and when deprived of its disagreeable taste, it can only be viewed as a demulcent, and is hardly equal in its effects to linseed, quince-seed, and marsh-mallows. It certainly does not cure phthisis pulmonalis; but in the last stage of that disease, when solid food is oppressive, and the diarrhoea appears to be kept up by the acrid contents of the stomach and bowels, it has appeared to check the latter, and to impart both vigor and nourishment to the digestive organs.—*Patent Office Rep.* See ICELAND.

Mosaic Gold. For the composition of this peculiar alloy of copper and zinc, called also *Or-molu*, Messrs. Parker and Hamilton obtained a patent in November, 1825. Equal quantities of copper and zinc are to be "melted at the lowest temperature that copper will fuse," which being stirred together so as to produce a perfect admixture of the metals, a further quantity of zinc is added in small portions, until the alloy in the melting-pot becomes of the color required. If the temperature of the copper be too high, a portion of the zinc will fly off in vapor, and the result will be merely spelter or hard solder; but if the operation be carried on at as low a heat as possible, the alloy will assume first a brassy yellow color; then, by the introduction of small portions of zinc, it will take a purple or violet hue, and will ultimately become perfectly white; which is the appearance of the proper compound

in its fused state. This alloy may be poured into ingots; but as it is difficult to preserve its character when re-melted, it should be cast directly into the figured molds. The patentees claim the exclusive right of compounding a metal consisting of from 52 to 55 parts of zinc out of 100. Mosaic gold, the *aurum musivum* of the old chemists, is a sulphuret of tin.

Mosaic (*Mosaïque*, Fr.; *Mosaisch*, Germ). There are several kinds of mosaic, but all of them consist in imbedding fragments of different colored substances, usually glass or stones, in a cement, so as to produce the effect of a picture. The beautiful chapel of Saint Lawrence, in Florence, which contains the tombs of the Medici, has been greatly admired by artists, on account of the vast multitude of precious marbles, jaspers, agates, aventurines, malachites, etc., applied in mosaic, upon its walls. The detailed discussion of this subject belongs to a treatise upon the fine arts.

Mosquito Coast, Mosquitia. The limits of this pseudo Central American State, Mosquitia or the Mosquito Coast, are so indefinite, and its extent inland so imperfectly ascertained, that scarcely more of a reliable character can be said respecting it physically, than politically or commercially. It is supposed to extend from Cape Honduras to the mouth of the River San Juan, having west the States of Honduras and Nicaragua, and north and east the Caribbean Sea, and to embrace about 26,000 square miles. The Mosquito Indians, its native and almost only inhabitants, are represented as an active and daring race, never brought under submission by the Spaniards. The San Juan River is claimed as its south boundary. Its capital is Blewfields, and it contains several other small villages, inhabited chiefly by native Indians and some few British colonists. The country is fertile, and, under proper cultivation, would produce cocoa, cotton, sugar, indigo, vanilla, and logwood; but, until some change takes place either in the mode of cultivation, or the form of government, its resources have but small chance for development. See HONDURAS.

Mother of Pearl (*Nacre de Perles*, Fr.; *Perlen mutter*, Germ.) is the hard, silvery, brilliant internal layer of several kinds of shells, particularly oysters, which is often variegated with changing purple and azure colors. The large oysters of the Indian seas alone secrete this coat of sufficient thickness to render their shells available to the purposes of manufacturers. The genus of shell fish called *pentadina* furnishes the finest pearls, as well as mother of pearl; it is found in greatest perfection round the coasts of Ceylon, near Ormus in the Persian Gulf, at Cape Comorin, and among some of the Australian seas. The brilliant hues of mother of pearl do not depend upon the nature of the substance, but upon its structure. The microscopic wrinkles or furrows which run across the surface of every slice, act upon the reflected light in such a way as to produce the chromatic effect; for Sir David Brewster has shown, that if we take, with very fine black wax, or with the fusible alloy of D'Arcet, an impression of mother of pearl, it will possess the iridescent appearance. Mother of pearl is very delicate to work, but it may be fashioned by saws, files, and drills, with the aid sometimes of a corrosive acid, such as the dilute sulphuric or muriatic; and it is polished by colcothar of vitriol.

Mozambique, a fortified maritime city, and the capital of the Portuguese possessions in eastern Africa, on an island at the entrance of Mesaril Bay, an inlet of the Mozambique Channel, $5\frac{1}{2}$ miles broad, and 6 miles in length, and receiving 8 small rivers, its entrance being sheltered also by the islands St. George and St. Jago, which help to bound its harbor. Mozambique Island, in lat. $15^{\circ} 2' S.$, long. $40^{\circ} 48' E.$, is about $1\frac{1}{2}$ miles in length, low, and of coral formation.

Mulberry. *Soil, Situation, Propagation, etc.*—The *morus nigra*, or black mulberry-tree, will grow in almost any soil or situation that is tolerably dry, and

in any climate not much colder than most parts of Britain and the United States. It is very easily propagated by truncheons or pieces of the branches, eight or nine feet in length, and of any thickness, being planted half their depth in tolerably good soil; when they will bear fruit the following year. As it is extremely tenacious of life, every part of the root, trunk, boughs, and branches may be converted into plants by separation; the rootlets, and small shoots or sprays, being made into cuttings, the larger boughs into stakes, the arms into truncheons, and the trunk, stool, and roots, being cut into fragments, leaving a portion of the bark on each, and planting them after the Italian mode of propagating the olive-tree. The mulberry may also be increased from seeds, by layers, or by grafting and budding. This tree, from its slowness of putting out its leaves, being rarely injured by spring frosts, and its leaves being seldom or never devoured by any insect, except the silkworm, and never touched with mildew, very seldom fails to produce a good crop of fruit. This fruit, however, though excellent, and exceedingly wholesome, does not keep, and is so far troublesome, that it is only good when it is quite ripe, and is best when it is suffered to fall from the tree itself. For this reason, mulberry-trees are generally planted on a lawn or grass-plot, to prevent the fruit that falls from being injured by the gravel or dirt. This practice, however, is objectionable, as no tree, perhaps, receives more benefit from the spade and the dunghill than the mulberry, and it ought, therefore, to be frequently dug about the roots, and occasionally assisted with manure. The ground under the tree should be kept free from weeds throughout the summer, particularly when the fruit is ripening, as the reflected light and heat from the bare surface of the soil is thus increased. In a cool, moist climate, like that of Britain, the fruit is also very fine if the tree be trained as an espalier, with the reflection of the south side of a building or wall. As a standard tree, whether for ornament or fruit, the mulberry requires very little pruning or attention of any kind, other than that which is given above. As it increases in age, it increases in productiveness, and in full-grown trees the fruit is much larger and better flavored than in those which are young.

Properties and Uses.—The wood of the *morus nigra* is less compact than even that of the white mulberry, and when perfectly dry, weighs only about 40 pounds to a cubic foot. It is said to be durable, and has been employed in England for various purposes of carpentry, for hoops, bows, wheels, and even ribs for small vessels, instead of oak. In France, this wood is considered of but little value, except for fuel. In some parts of Spain, in Sicily, and in Persia, the leaves of this species are said to be preferred to those of the white mulberry for the food of silkworms. The leaves are also eaten by cattle, sheep, and goats. The roots have an acrid, bitter taste, and are considered as an excellent vermifuge, when taken, in powder, in doses of half a drachm. The tree, in every part, contains a milky juice, which, being coagulated, is found to form a coarse kind of elastic gum. The fruit of this tree is of an agreeable acid and aromatic flavor, and is eaten raw, as a dessert, or may be formed into an agreeable preserve; and Evelyn says that, mixed with the juice of cider apples, it makes a very strong and agreeable wine. Dr. Clarke observes, that he saw some Greeks, in the Crimea, employed in distilling brandy from mulberries; which he describes as "a weak but palatable spirit, as clear as water." A wine is also made from it in France; but it requires to be drunk immediately, as it very soon becomes acid. The fruit, when ripe, is regarded as cooling and laxative, allaying thirst, and being grateful in cases of fever. When made into a syrup, it is considered excellent for a sore throat. Like the strawberry and raspberry, it is said to undergo the acetous fermenta-

tion in the stomach, and therefore may be safely eaten by persons afflicted with the rheumatism or gout. All kinds of poultry are excessively fond of this fruit, and devour it with avidity, whenever within their reach.

Insects and Diseases.—The leaves of the *morus alba*, or white mulberry-tree, are believed to be eaten by no other insect but the silkworm (*bombyx mori*). M. Pulein, however, made experiments with various kinds of insects, but they all rejected the mulberry leaf for food, except "a green worm, about an inch long, and as thick as an oat straw." Although he found it upon a mulberry, it was his belief that it was not peculiar to that tree alone, but found its way there by accident. The white mulberry, however, is attacked by numerous diseases, occasioned partly, no doubt, by the unnatural manner in which it is treated, by being stripped of its foliage. One of these diseases is brought on by any sudden check given to the transpiration of the leaves, which turn yellow, and fall off, shortly after causing the tree to die. Another is the death of the roots, which is accompanied by the formation on them of parasitic fungi. The leaves are also apt to be attacked with honey-dew, mildew, rust, and other diseases, which render them unfit for the food of the silkworm. Those leaves covered with honey-dew may be washed, and, when thoroughly dry, may be given to the insects without injury; but the other diseased leaves should be thrown away. If leaves covered with honey-dew are employed without washing, they cause dysentery and death to the worms. As it is not our intention to treat of the whole art of the rearing and management of the silkworm, we are compelled to refer the reader to a "*Treatise on the origin and Progressive Improvement of the Silk Manufacture*," being the 22d volume of the London Cabinet Cyclopaedia; also to the work of Count Dandolo, entitled "*Dell'Arte di governare i Bacchi da Seta*," KENRICK'S "*American Silk-Grower's Guide*," and to most of the agricultural journals of the day.

Properties and Uses.—The wood of the *morus alba*, when dry, weighs 44 pounds to a cubic foot. In France, the principal uses of that of the trunk, is for various purposes of turnery, and carpentry, and for the making of wine-casks, for which it is highly valued, as it is said to impart an agreeable violet-like flavor to white wines. The branches are used for vine-props, posts and rails to rural fences, and for fuel. The bark may be converted into linen of the fineness of silk. For this purpose the young wood is gathered in August, during the second ascent of the sap, and immersed for three or four days in still water. It is then taken out, at sunset, spread on the grass, and returned to the water at sunrise. After repeating this process daily for some time, it is finally taken out, dried, and prepared like flax. The bark is also used like that of the European lime-tree, for making bast for mats, etc. The bark, and more especially the leaves of the white mulberry, abound in a milky juice, which is found to possess more or less of the properties of caoutchouc, according to the climate in which the tree is grown. It is doubtless owing to this property in the leaves of the mulberry, that the cocoons of the silkworm have so much more tenacity of fibre than those of any other insect that feeds on the leaves of trees. Hence, also, the silk, like the tobacco and wine of warm climates, and of poor, dry soils, is always superior to that produced in colder climates, and from rich and moist soils. To verify this opinion, we quote the following very judicious observations from the "*Journal d'Agriculture de Pays-Bas*," which will not only show the impracticability of profitably raising silk in the higher latitudes, but will serve as an infallible guide in the choice of a soil and climate for this species of agriculture: "The mulberry-tree is found in different climates; but the juice of the leaves grown in the north is much less suitable for the production of good silk, than that of the leaves of the south. In this respect,

mulberry leaves and silk differ as much as wines, according to the climate and soil in which they are produced. In general, every climate and soil that will grow good wheat will produce large, succulent mulberry leaves; but these leaves will, in many cases, be too nutritive; that is, they will have too much sap, and too much substance and succulency. The wild mulberry, with small leaves, answers better, for such a soil, than the grafted mulberry, with large leaves. A general rule, and one to be depended on, is, that the mulberry, to produce the best silk, requires the same soil and exposure that the vine does to produce the best wine. Experience has proved that silkworms nourished by leaves gathered from a dry soil, succeed much better, produce more cocoons, and are less subject to those diseases, which destroy them, than those which have been nourished by leaves produced by an extremely rich soil." The fruit of the white mulberry is less acid than that of the black species, and that of some of the varieties, particularly of the *morus a. multicaulis*, is used for making robs and syrups, and is said to be remarkably good to eat, in warm climates.

The perfect wood of the *morus rubra*, or red mulberry-tree, which is fine-grained and compact, though light, is of a yellowish hue, approaching to lemon-color. It possesses strength and solidity; and, when properly seasoned, it is almost as durable as that of locust, to which, by many persons, it is esteemed equal. In the dockyards at Philadelphia, Baltimore, and the more southern ports, it is employed in the construction of both the upper and lower frames of vessels, for knees, floor-timbers, etc.; and is preferred to every other kind of wood for trenails, except that of the locust. In Charleston, South Carolina, it is sometimes selected for the ribs of large boats. It is also used in the parts of the country where it abounds, for the posts of rural fences, which, from their durability, are as much esteemed as those of the locust. As the leaves of this species are thick, rough, and hairy, while young, they are improper for the food of silkworms, which feed with advantage, in a cold climate, only on the *morus alba*, or some of its varieties. The red mulberry is well deserving of cultivation, both from its thick and shady foliage, and the agreeable flavor of its dark-red fruit.

The wood of the paper mulberry, which is soft, spongy, and brittle, is of little value except for fuel. The leaves are too rough and coarse, in their texture, for the food of silkworms; but they are found to be excellent fodder for cattle; and as the tree will grow rapidly in almost every soil, and throws out numerous tufts of leaves, it has been suggested that it might be valuable to cultivate, in some situations and climates, for that purpose. The juice of this tree is sufficiently tenacious to be used in China as a glue, either in gilding leather or paper. The finest and whitest cloth worn by the inhabitants of Otaheite, and of the Sandwich Islands, is made of its bark. But the principal use, however, to which this tree appears to be applied, is for the manufacture of paper. The following is an abridgment of Kämpfer's account of the process of making this article in Japan, as quoted from the fifth volume of the London "*Penny Cyclopaedia*:" "The branches of the current year, being cut into pieces about a yard long, are boiled until the bark shrinks from the wood, which is taken out, and thrown away; and the bark, being dried, is preserved till wanted. In order to make paper, it is soaked for three or four hours in water; after which, the external skin (*epidermis*), and the green internal coat, are scraped off, and the strongest and finest pieces are selected; the produce of the younger shoots being of an inferior quality. If any very old portions present themselves, they are, on the other hand, rejected as too coarse. All knotty parts, and every thing which might impair the beauty of the paper, are also removed. The chosen bark is boiled in a lixivium till its downy fibres can be separated by a touch of the finger. The pulp, so produced,

is then agitated in water till it resembles tufts of tow. If not sufficiently boiled, the paper will be coarse, though spongy; if too much, it will be white, indeed, but deficient in strength and solidity. Upon the various degrees and modes of washing the pulp, much also depends as to the quality and beauty of the paper. Mucilage obtained from boiling rice, or from a root called oreni, one of the mallow tribe, is afterward added to the pulp. The paper is finished much after the European mode, except that stalks of rushes are used, instead of brass wires." The article thus made, constitutes the India or China paper used by engravers for taking proofs, and by chemists for filters.—BROWNE'S *Trees of America*.

Munjeet, a species of *Rubia tinctorum*, or madder, produced in Nepal, and in various districts of India. That which is brought to England is imported from Calcutta, and is cultivated in the high lands about Natpore in Purnea. The roots are long and slender, and when broken appear of a red color. It is used in dyeing; the red which it produces being, though somewhat peculiar, nearly the same as that produced by European madder. Dr. Bancroft says that the color which it imparts to cotton and linen is not so durable as that of madder; but that upon wool or woollen cloth its color is brighter and livelier; and, when proper mordants are used, nearly, perhaps quite, as permanent.—*Permanent Colors*, vol. ii., p. 279. The best munjeet is in pieces about the bigness of a small quill, clean and firm, breaking short, and not pipy or chaffy. Its smell somewhat resembles liquorice root.

Muriatic or Hydrochloric Acid; anciently *marine acid*, and *spirit of salt*. (*Acide hydrochlorique*, and *Chlorhydrique*, Fr.; *Salzsäure*, Germ.) This acid is now extracted from sea-salt, by the action of sulphuric acid and a moderate heat; but it was originally obtained from the salt by exposing a mixture of it and of common clay to ignition in an earthen retort. The acid gas which exhales, is rapidly condensed by water. 100 cubic inches of water are capable of absorbing no less than 48,000 cubic inches of the acid gas, whereby the liquid acquires a specific gravity of 1.2109; and a volume of 142 cubic inches. The muriatic acid of commerce has usually a yellowish tinge, but when chemically pure it is colorless. It fumes strongly in the air, emitting a corrosive vapor of a peculiar smell. The characteristic test of muriatic acid in the most dilute state, is nitrate of silver, which causes a curdy precipitate of chlorid of silver.

Muscat, a city and seaport situated on the east coast of Arabia, about 96 miles N. W. of Cape Rass-el-gate (Ras-el-had), in lat. 23° 38' N., long. 58° 37½' E. Population uncertain; but estimated by Lieutenant Wellsted at 40,000, which we incline to think beyond the mark. There are more Banians here than in any other city in Arabia. There are among them some very extensive merchants, who engross almost the whole pearl trade of the Persian Gulf, and the supply of corn from India. The negro slaves are numerous, and are generally stout, well made, and active. The harbor, which is the best on this part of the Arabic coast, opens to the north, and is shaped like a horse-shoe. It is bounded on the west and south by the lofty projecting shores of the mainland, and on the east by Muscat Island, a ridge of rocks from 200 to 300 feet high. The town stands on a sandy beach at the south end or bottom of the cove or harbor, about 1½ miles from its mouth. The depth of water near the town varies from three to four and five fathoms. Ships at anchor are exposed to the north and north-west winds; but as the anchorage is everywhere good, accidents are of very rare occurrence. The harbor is protected by some pretty strong forts. Vessels are not allowed to enter after dusk, nor to leave before sunrise. If the usual signal be made for a pilot, one will come off, but not otherwise. It is best to make them attend till the vessel be secured, as they

have excellent boats for carrying out warp anchors. Muscat is a place of considerable importance, being at once the key to, and commanding the trade of, the Persian Gulf. The dominions of the imaum, or prince, are extensive, and his government is more liberal and intelligent than any other in Arabia or Persia. The town, situated at the bottom of a high hill, is ill-built and filthy; and, during the months of July and August, is one of the hottest inhabited places in the world. The country in the immediate vicinity of the town is extremely barren; but it improves as it recedes from the shore. Dates and wheat, particularly the first, are the principal articles of produce. The dates of this part of Arabia are held in high estimation, and are largely exported, those of Bushire and Bussorah being imported in their stead. A date tree is valued at from \$7 to \$10, and its annual produce at from \$1 to \$1½. An estate is said to be worth 2,000, 3,000, 4,000 date trees, according to the number it possesses.

But the place derives its whole importance from the commerce and navigation of which it is the centre. The imaum has some large ships of war, and his subjects possess some of the finest trading vessels to be met with in the Indian seas. The part of Arabia adjoining to Muscat is too poor to have any very considerable direct trade; but, owing to its favorable situation, the backward state of the country round the Persian Gulf, and the superiority of its ships and seamen, Muscat has become an important *entrepôt*, and has an extensive transit and carrying trade. Most European ships bound for Bussorah and Bushire touch at it; and more than half the trade of the Persian Gulf is carried on in ships belonging to its merchants. (See BUSHIRE.) But, exclusive of the ports on the gulf, and the south and west coasts of Arabia, ships under the flag of the imaum trade to all the ports of British India, to Singapore, Java, the Mauritius, the east coast of Africa, &c. The pearl trade of the Persian Gulf is now, also, wholly centered at Muscat. All merchandize passing up the gulf on Arab bottoms pays a duty of one half per cent. to the imaum. He also rents the islands of Ormuz and Kishmee, the port of Gombroon, and some sulphur mines, from the Persian government. In the magazines of Muscat may be found every species of produce imported into or exported from the Persian Gulf. Various articles are also imported for the use of the surrounding country, and for the internal consumption of Arabia. Among these, the principal are rice, sugar, coffee from Mocha, cotton and cotton cloth, cocoanuts, wood for building, slaves from Zanguebar, dates from Bushire and Bussorah, &c. Payment for these is chiefly made in specie and pearls; but they also export drugs of various descriptions, ivory, gums, hides, ostrich feathers, horses, sharks' fins, a sort of earthen jars, called martuban, to Tranquebar, dried fish, an esteemed sweetmeat called *hulwah*, and a few other articles. The markets of Muscat are abundantly supplied with all sorts of provision. Beef, mutton, and vegetables of good quality may be had at all times, and reasonably cheap. The bay literally swarms with the greatest variety of most excellent fish. Water is excellent, and is conveyed to the beach in such a manner that the casks of a vessel may be filled in her boats while afloat. Firewood is also abundant, and is cheaper than at Bombay. A duty of five per cent. is laid on imports, all exports being duty free. The entire value of the imports has been estimated at £900,000.

Money, Weights, and Measures.—Accounts here are kept in goz and mamoodies: 20 goz = 1 mamoodi and 20 mamoodies = 1 dollar. All Persian, Turkish, and Indian coins, as well as French and German crowns, and Spanish dollars, are met with; their value fluctuating with the demand; and they are generally sold by weight. The weights are, the *cucha* and *maund*; 24 *cuchas* = 1 *maund* = 8 lbs. 12 oz. avoirdupois. Niebuhr thinks that Muscat occupies the site

of the Mosca of Arrian and other Greek writers (*Voyage en Arabie*, vol. ii., p. 71, ed. Amst. 1780); a conjecture which seems to be confirmed, not merely by the resemblance of the name, but also by the terms applied by Arrian to Mosca being sufficiently descriptive of Muscat; and as the port is bounded on all sides by rocks, it must now present almost the same appearance as in antiquity. Dr. Vincent, however, though he speaks doubtfully on the subject, is inclined to place Mosca to the west of Cape Rasselgate.—*Commerce and Navigation of the Ancients*, vol. ii., pp. 344–347. For further particulars, besides the authorities above referred to, see HAMILTON'S *New Account of the East Indies*, vol. i., p. 63; FRAZER'S *Journey to Khorasan*, pp. 5–19; WELLSTED'S *Travels in Arabia*, i., pp. 14–25. The longitude given above is that of ARROWSMITH'S *Chart of the Persian Gulf*.

Commerce with the United States.—The Sultan of Muscat concluded a treaty with the United States, September 21, 1833, and it took effect June 24, 1837, the day on which the President of the United States made his proclamation. Its stipulations establish perpetual peace between the two countries, and open the ports of each to the vessels and citizens of the other, with unrestricted liberty of trade, reserving in the island of Zanzibar the sale of muskets, powder, and ball to the government only, but leaving the trade in these articles in all other ports of the sultan's dominions free from every restriction. The treaty further stipulates that vessels of the United States entering any port within the sultan's dominions shall pay no more than five per cent. duties on the cargoes landed, which shall be in full of all import and export duties, tonnage, license to trade, pilotage, anchorage, or any other charge whatsoever; that no charge shall be made on that part of the cargo which may remain on board and be re-exported; that no charge shall be made on any vessel of the United States which may enter any of the sultan's ports for the purpose of refitting, or for refreshments, or to inquire the state of the market. It is further stipulated that the American citizen shall pay no other duties on export or import, tonnage, license to trade, or other charge whatsoever, than the citizens of the most favored nation shall pay; and similar equality in the ports of the United States is extended to the vessels and citizens of the sultan.

In the report to the Department of State, of the agent by whom this treaty was negotiated, the following paragraphs occur: "The Sultan of Muscat is a very powerful prince. He possesses a more efficient naval force than all the native princes combined, from the Cape of Good Hope to Japan. His resources are more than adequate to his wants. They are derived from commerce, running himself a great number of merchant vessels; from duties on foreign merchandise; and from tribute-money and presents received from various princes; all of which produce a large sum. His possessions in Africa stretch from Cape Delgado to Cape Guardafui, and from Cape Aden, in Arabia, to Ras el Haud; they extend along the northern coast of Aman to the entrance of the Persian Gulf; and he claims also the sea-coast and islands within the Persian Gulf, including the Bahrein Islands, and the pearl-fishery contiguous to them, with the northern coast of the gulf, as low down as Scindy. * * * In Africa he owns the ports of Monghow, or Mongallow, Lyndy, Quiloah (Keelwah), Melinda, Larmo, Patta, Brava, Magadosha (alias Mogadore), and the valuable islands of Monfeca, Zanzibar, Pemba, Socotra (Socotera)," etc.

The exports from the African part of his dominions are gum-copal, aloes, gum-arabic, columbo-root, and a great variety of other drugs, ivory, tortoise-shell, rhinoceros' horns, hides, beeswax, coconut-oil, rice, millet, etc. From Muscat the exports are wheat, raisins, drugs, dates, salt, dried fish, etc. It is estimated that seven-eighths of all the ivory imported in-

to the United States, and all the copal of the finest quality, are from the island of Zanzibar. To this place all the goods collected for this large trade are imported, and sold to the Banians and Hindoos at six months' credit. The United States supply by far the most important goods for all the coast trade, viz.: Lowell manufactured sheetings and shirtings. Other goods in demand for the coast trade are powder, muskets, brass-wire, glass-beads, and India rubber goods. The currency of Muscat differs materially from that of the Persian Gulf or Africa, and, with its weights and measures, is peculiar to the country. The Spanish dollar is current, and the Spanish doubloon varies in value from \$14 to \$16. See ZANZIBAR.

Muscat, Imamot of, an extensive and powerful State of Arabia, comprising the eastern portion of that peninsula, its authority also extending over its south-east coast nearly as far as Aden, and over parts of the coast of Persia on the Persian Gulf, and that of east Africa from the equator south to Cape Delgado. Area and population not ascertained. Besides Muscat, the capital, this dominion comprises the towns of Rostak, Muttra in Arabia, and Juba, Melinda, Mombas, Magadoxo, Bravah, Quiloa and Lyndy in Africa, with the islands Zanzibar, Socotra, etc., and it has an active trade with all the adjacent countries, and with British India. The imaum has a patriarchal and despotic sway, and the most efficient naval force of any native prince from the Cape of Good Hope to Japan.—*Muscat* or *Mascua* (probably the *Mosca* of Arrian), a fortified maritime city of east Arabia, capital above dominion, on a peninsula in the Arabian Sea, lat. 23° 37' N., long. 58° 35' E. Population estimated at 40,000 to 50,000. It is surrounded by heights all strongly fortified. The harbor of the city is well sheltered, and has deep water. Muscat is the grand emporium of east Arabia, and the key to the entrance of the Persian Gulf. Imports estimated \$4,500,000 in value annually, and consist chiefly of almonds, aloes, assa-fœtida, gum ammoniac, sulphur, nitre, gum copal, frankincense, coffee, pearls, ivory, horns, hides, wax from Persia and Africa, most of which are re-exported to India and the East; the returns thence being made in British and India cotton goods, shawls, China manufactures. Large quantities of dates, as also wheat, horses, salt, and dried fish, are among the principal exports. The port is usually touched at by vessels going up the Persian Gulf. Though the country around it is sterile, a plentiful supply of provisions may generally be obtained at Muscat.

Commercial Relations with the United States.—The treaty made by the United States in 1837, with the Sultan of Muscat has been duly observed, and a very friendly disposition shown by the authorities to all Americans. The present existing commercial regulations are fixed and permanent. There are no privileges permitted to other nations which are denied to our own. There are no port charges or other dues levied on vessels of the United States. There is no drawback of duties; merchandise from one vessel to another, or landed for re-shipment, must pay a duty of 5 per cent. The German crown, and pice, and pic, from the East India Company's possessions, are the only currency. The number of pice for a German crown (better known in these countries as the black dollar) varies, according to the supply, from 116 to 128. At this present time, 120 pice are given for one black dollar, and 3 pic make one pice. Spanish and Mexican dollars are worth no more, and do not circulate freely. They are purchased for the Bombay market, usually at a premium of 2 to 3 per cent. at the commencement of the south-west monsoon, in April, and also near its close, in September, and find their way from thence to China. American half eagles are worth \$5; English sovereigns, \$4.75; Spanish and Portuguese doubloons, \$16; Spanish quarters and eighths pass freely at 25 and 12½ cents, and American

dimes and half dimes at 10 and 5 cents. Merchandise is bought and sold for dollars and cents.

Ivory.—This article varies greatly in price, according to quality and size. The superior kinds, and largest and best, are sent to the United States. In lots, average weight 70 lbs. and upward, \$40 to \$44 per frasila of 85 lbs. Ivory, 50 to 60 lbs. average weight, \$37 to \$40 per frasila. Tortoise shell per pound, of 3 lbs. English, \$2 to \$5. Gum copal, per frasila of 85 lbs. English, \$5 to \$7. Hides, per conge of 20 lbs., \$10 to \$15 per conge. Cloves, per frasila of 35 lbs., \$1.75 to \$2.50.

Commissions usually charged, 2½ per cent. As for freights and insurance, there are no rates to the United States. Cargoes imported from the United States are invariably sold at 6 months' credit. If cash is wanted for a sale, a discount is made of 4½ per cent. for 6 months. As for exchange, the captains of whale ships draw upon their owners for the cash they require, and the usual charge is 20 per cent. Duties, 5 per cent. on all cargo landed. No duties on exports to the United States. There are no internal taxes of any kind paid by the people of this island directly. The sultan's revenue is derived from duties on all articles of commerce brought from the neighboring coast, Red Sea, Aden, Persian Gulf, Bombay, and the Malabar coast. The negro slaves are almost the only common laborers, and receive per day about 12½ cents, or \$2.50 to \$3 per month. The higher order of servants to oversee the work in preparing and shipping cargoes are paid from \$7.50 to \$10 per month. Native workmen in the various branches of mechanic industry receive about \$5 to \$7 per month.

No steamers are owned or built here, and there are no facilities for ship-building, or even repairing, to any extent. The sultan has a few ships-of-war built either at Bombay or at places on the coast of Malabar. They are manned by slaves and officered by Arabs. The only vessels owned here by natives are called *dows*, and seem to answer the purpose very well, but are the rudest kind of ship possible to conceive of, and never undertake to get to any place against the monsoon. They sail fast, and are of very peculiar construction. Zanzibar is a large, fertile, and populous island, and the favorite residence of the sultan, who is far superior to his brother princes in intelligence, and has a disposition to introduce improvements into his dominions. But his subjects, like all Arabs, are far behind other nations, and despise all improvement. Cloves are produced upon this island in large quantities, and the annual increase is considerable. All other articles of export are brought from other places. See *Com. Rel., U. S.*, vol. iii., 1866-57, pp. 367-368.

Musk (Fr. *Musc*; Ger. *Bisam*; Du. *Muskus*; It. *Muschio*; Sp. *Almizelo*; Rus. *Muscus*; Arab. and Pers. *Mishk*) is obtained from a species of deer (*Moschus moschiferus*) inhabiting the Alpine mountains of the east of Asia. The musk is found in a small bag under the belly. Musk is in grains concreted together, dry, yet slightly unctuous, and free from grittiness when rubbed between the fingers or chewed. It has a peculiar, aromatic, and extremely powerful and durable odor; the taste is bitterish and heavy; and the color deep brown, with a shade of red. It is imported into England from China in caddies containing from 60 to 100 oz. each; but an inferior kind is brought from Bengal, and a still baser sort from Russia. The best is that which is in the natural follicle or pod. Being a very high-priced article, it is often adulterated. That which is mixed with the animal's blood may be discovered by the largeness of the lumps or clots. It is sometimes mixed with a dark, highly colored, friable earth; but this appears to the touch to be of a more crumbling texture, and is harder as well as heavier

than genuine musk. 20 cwt. of musk are allowed to a ton. It was not permitted to be brought home in the China ships belonging to the East India Company.—*THOMSON'S Dispensatory*; *MILBURN'S Orient. Com.*

Muslin (Ger. *Musselin*, *Nesseluck*; Du. *Neteldoek*; Fr. *Mousseline*; It. *Moussolina*; Sp. *Moselina*; Rus. *Kissea*) is derived from the word *moussale* or *mousseln*, a name given to it in India, where large quantities are made. It is a fine thin sort of cotton cloth, with a downy nap on the surface. Formerly all muslins were imported from the East; but now they are manufactured in immense quantities at Manchester, Glasgow, etc., of a fineness and durability which rival those of India, at the same time that they are very considerably cheaper. See *COTTON*.

Mustard (Ger. *Mustert*, *Senf*; Fr. *Moutarde*; It. *Mostarda*; Sp. *Mostaza*; Rus. *Gortschiza*; Lat. *Sinapis*; Arab. *Khirdal*; Hind. *Rai*), a plant (*Sinapis*) of which there are several species. It is a native of Europe, and is now naturalized, and a common weed in some parts of the United States. It is besides very commonly cultivated for the sake of the seeds, which, when powdered and mixed with vinegar, form a well known pungent condiment in daily use. The root is annual; the stem three or four feet high; the lower leaves are lyrate, and the upper ones landolate and entire. The flowers are small and yellow. It belongs to the natural family *cruciferae*, and is known by the smooth four-cornered pods which are pressed close to the stem. Table mustard, mixed with warm water, and taken in considerable quantities, acts as an emetic, and as such is so much the more valuable from its being always at hand. The white mustard (*S. alba*) is milder than the preceding, and on this account is more agreeable to some palates.—*E. A.*

Mutiny of the Bounty. Memorable mutiny on board the *Bounty* armed ship returning from Otaheite with bread fruit. The mutineers put their captain, Bligh, and 19 men, into an open boat near Annamooka, one of the Friendly Islands, April 28, 1789, and they reached the island of Timor, south of the Moluccas, in June, after a perilous voyage of nearly 4000 miles, in which their preservation was next to miraculous. The mutineers were tried September 15, 1792, when six were condemned, of whom three were executed.

Myrobalans are the dried fruits of different varieties of *terminalia*. The fruit, varying from the size of an olive to that of a gall-nut, consists of a white pentangular nut, covered by a substance about two lines in thickness. The latter, which is the only valuable part, is mucilaginous and highly astringent; and being separated from the nut is employed, with the best effect, both by dyers and tanners, especially by the latter. It produces with iron a strong, durable, black dye and ink; and with alum, a very full, though dark, brownish yellow. The imports vary considerably.—*BANCROFT ON Permanent Colors*, i., 351, etc.

Myrrh (Ger. *Myrrhen*; Du. *Mirrh*; Fr. *Myrrhe*; It. and Sp. *Mirra*; Lat. *Myrrha*; Arab. *Murr*), a resinous substance, the produce of an unknown tree growing in Arabia and Abyssinia. It is imported in chests, each containing from one to two cwt. Abyssinian myrrh comes to us through the East Indies, while that produced in Arabia is brought by the way of Turkey. It has a peculiar, rather fragrant, odor, and a bitter aromatic taste. It is in small irregularly shaped pieces, which can hardly be called tears. Good myrrh is translucent, of a reddish yellow color, brittle, breaking with a resinous fracture, and easily pulverized. Its specific gravity is 1.86. When it is opaque, mixed with impurities, and either white, or of a dark color approaching nearly to black, with a disagreeable odor, it should be rejected.—*THOMSON'S Dispensatory*.

N.

Nails (Ger. *Nägel*, *Spiker*; Du. *Spykers*; Fr. *Clous*; It. *Chiodi*, *Chiovi*, *Aguti*; Sp. *Clavos*; Rus. *Gvozdí*) are small spikes of iron, brass, etc., which, being driven into wood, serve to bind several pieces together, or to fasten something upon them. The consumption of nails is immense; and the aggregate value of those annually produced is very large.

See IRON and HARDWARE.

Nangasacki, a sea-port town on the south-west coast of the island of Ximo, one of the Japanese islands, being, according to Krusenstern, in lat. $32^{\circ} 43' 40''$ N., long. $130^{\circ} 11' 47''$ E. The harbor extends N. E. and S. W. about $2\frac{1}{2}$ leagues, being, in most places, less than a mile in width. Ships lie in 5 or 6 fathoms water, within a gunshot of the town, near the middle of the bay where they are protected from all winds.

Nankeen or Nankin (Ger. *Nanking*; Du. *Nankings linnen*; Fr. *Toile Nankin*; It. *Nanquino*; Span. *Nanquina*), a species of cotton cloth in extensive use in this country. It takes its name from Nanking, in China, a European corruption of Kyang-ning, the capital of the extensive province of Kyang-nan, where it is principally produced, and which also furnishes the greater part of the green teas. In the East, the man-

ufacture is wholly confined to China. The cloth is usually of a yellowish, though occasionally it is of a blue color, and of different degrees of fineness; the broad pieces called "the Company's nankeens," are generally of a better quality than the narrow ones, and are most esteemed. The color, whether yellow or blue, is given to the cloth by dyeing; for though yellow cotton wool be raised in the East, the cloth made from it is too glaring. The nankeens brought to England come under the general denomination of piece goods. They are mostly made into trowsers and waistcoats for gentlemen's wear during summer, ladies' pelisses, etc. In some of the more southern parts of Europe, the warmer parts of Asia and America, and the British settlements in Africa, nankeen is worn by both sexes all the year round, and constitutes the principal article of attire. Latterly, however, they have become unfashionable in this country, and their importation has, in consequence, all but ceased. See article CANTON.

Nankin, or Nanking ("court of the South"), a city, and the ancient capital of China, capital of the province of Kiangsu, near the Yang-tze-Kiang, about 90 miles from its mouth. Lat. $32^{\circ} 2' N.$, long. $118^{\circ} 49' E.$ Population estimated at 400,000. Its ancient walls can be traced over hill and dale for 35 miles, but Nankin has so greatly declined since the transference of the seat of empire to Pekin by Kublai-khan in the 13th century, that the modern walls are of much less extent, and the city scarcely occupies one eighth part of the surface inclosed by them, and it is commanded by hills especially on the east, and otherwise ill-calculated for defense. Principal objects of interest are the famous porcelain tower of 9 stories and 200 feet in height, completed in 1432 at a cost, as stated, of about \$3,500,000; and the "tomb of kings" (supposed to be of the Ming dynasty, A.D. 1328 to 1621), leading to which is a fine-paved road with an avenue of gigantic armed figures. The governor's palace, and an observatory, are worthy of notice. Here are important manufactures of crape, satin of the finest quality, paper, artificial flowers, China or Indian ink, and nankeen, which hence derives its name, but is also made throughout the whole province. It is the centre of a very extensive trade, and by the great canal which crosses the Yang-tze-kiang, about 50 miles eastward, it communicates directly with Pekin, to which city a good deal of fish is sent hence, among other articles. It is also the place of a grand viceroy, with authority over the Kiang provinces, of a great military dépôt, and the chief seat of literature in the empire.

Nantes, a large commercial city and sea-port of France, on the Loire, about 34 miles from its mouth, in lat. $47^{\circ} 18' 6'' N.$, long. $1^{\circ} 32' 44'' W.$ Population, in 1851, 96,362. Vessels drawing 18 and 19 feet water come up to Paimboeuf, about 24 miles lower down the river; but no vessel, drawing more than 11 or 12 feet can come up to the city, unless at high water a day or two before *full* and *change*. There are three entrances to the Loire. The first and most generally frequented is between the bank called *Le Four* and *Point Croisic*; there is a second between *Le Four* and the bank called *La Banche*; and the third, which in southerly winds is much resorted to, between the latter and the rocks called *La Couronne*. The navigation, which is naturally rather difficult, has been much facilitated by the erection of light-houses and beacons. Of the former, one has been recently constructed on the north part of *Le Four*, about a league from *Croisic*, in lat. $47^{\circ} 17' 53'' N.$, long. $2^{\circ} 38' 8'' W.$ It is 56 feet high. The light is a revolving one; the flash, which continues for 7 seconds, being succeeded by a dark interval of 53 sec-

onds. Two light-houses, called the Aiguillon lights, stand on the north side of the river, near its mouth; the lower light, adjoining *Point de Levi*, being in lat. $47^{\circ} 14' 33''$ N., long. $2^{\circ} 15' 46''$ W. The light is fixed, and is 111 feet above the level of the sea. The upper Aiguillon light, situated about a mile N. 81° E. from the lower, is 127 feet high; it also is a fixed light, varied, however, by a flash every 3 minutes. A beacon tower, called the Turk, is erected on the southernmost extremity of La Blanche; the course for vessels entering between it and La Couronne, is to bring the Aiguillon lights in one. The depth of water on the bar at the mouth of the river varies from 2 to $2\frac{1}{2}$ fathoms. At springs the rise is 14, and at neaps 7 or 8 feet. High water at full and change $3\frac{1}{2}$ hours.

Her situation renders Nantes the emporium of all the rich and extensive country traversed by the Loire, so that she has a pretty considerable import and export trade, particularly with the West Indies. The exports consist of all sorts of French produce, but principally of brandy, wine and vinegar, silk, woolen and linen goods, refined sugar, wheat, rye, biscuits, etc. The principal imports are sugar, coffee, and other colonial products, cotton, indigo, timber, hemp, etc. Nantes is a considerable entrepôt for the commerce of salt, large quantities being made in the Department, principally at Noirmutiers and Croisic. During the time that the slave trade was carried on, Nantes was more extensively engaged in it than any other French port. The custom duties of Nantes, exclusive of those on salt, produced, in 1851, 10,817,000 francs; she being in this respect inferior only to Marseilles, Havre, and Bordeaux. There belonged to the port, except river craft, coasters, and steamers, on the 31st December, 1851, 569 ships, of the burden of 68,121 tons.

The port charges levied on vessels of the United States are the same, and no more than the port charges levied on French vessels, except the tonnage duty, which is 94 cents per ton register, the same as the French vessels pay in the United States. The transshipment in vessels of the United States of goods is permitted to any port, except from a French port to another French port, which would be considered as a coasting trade; and no vessels of any nation whatsoever are allowed to do that trade, except the Spanish vessels, Spain having an ancient treaty with France to that effect.

AMOUNT AND CHARACTER OF THE PORT CHARGES LEVIED ON AMERICAN VESSELS AND FRENCH VESSELS AT THE PORT OF NANTES, THE VESSEL BEING SUPPOSED TO BE OF A BURDEN OF 299 TONS PER REGISTER, AND DRAWING 11 FEET AMERICAN.

Pilotage.—Vessels under 80 tons (if French or assimilated by treaty) are not obliged to take a pilot at sea, but must have one for the river. The rates, which are fixed by law, are paid by the *foot* from the sea to Paimbœuf, and from thence to Nantes for all vessels under 80 tons. Above 80 tons, they are per ton. The master of a vessel bound to Paimbœuf or Nantes has merely to give a note to the pilot stating where the pilot boarded him, where he left him, the name and draught of water of his vessel in *English* feet. The note will be deposited at the pilot's office, and the pilotage be received from the ship's broker. No foreign vessel, however small, can be removed from one anchorage to another, or to or from a quay,

but by a pilot. Every vessel is boarded at St. Nazaire, and if she has a foul bill of health, or disease on board, is instructed where to go. *River Dues* on vessels ascending from Paimbœuf to Nantes are about 1½ d. per ton. At Paimbœuf, and below it, none are levied. If a vessel under sail causes damage to another that is properly moored, she must pay all the expenses of repairs; if to a vessel at single anchor (unless intentionally done) or under sail, the expense of the repairs of both are added together, and each pays a moiety. The same rule is enforced if damage be caused by one vessel properly moored driving on board another in the same situation; but if either were riding at single anchor, the one properly moored is indemnified; if both were at single anchor, both bear the loss alike.

Naples, a large city and sea-port in the south of Italy, the capital of the kingdom of the same name, the light-house being in lat. $40^{\circ} 50' 12''$ N., long: $14^{\circ} 14' 15''$ E. Population, in 1851, 416,475. Naples is well situated for commerce; but the policy of the government has hitherto been most unfavorable to its growth, and has confined it within comparatively narrow limits. The Bay of Naples is spacious, and is celebrated for its picturesque views. The harbor is formed by a mole, built nearly in the form of the letter L, having a light-house on its elbow. Within the mole there is from 3 to 4 fathoms water, the ground being soft. The water in the bay is deep, and there is no bar; it is, however, a good deal exposed to the south-westerly winds; and to guard against their effects, vessels lying in the bay moor with open hawse in that direction. There is no obligation to take a pilot on board, but it is usual to take one the first time that a ship anchors within the mole. The light-house has a revolving light. The period of revolution is 2 minutes, during the first of which the full strength of the light is continued, and during the second minute its brilliancy rapidly decreases. The height of the light is 161 feet above the sea, and it is visible at the distance of 18 or 20 miles. At the extremity of the mole is a low fixed light to guide vessels round its head.

EXPORTS FROM THE CONTINENTAL STATES OF THE TWO SICILIES, BY LAND AND BY SEA, IN NATIONAL AND FOREIGN VESSELS, IN EACH YEAR FROM 1840 TO 1850, BOTH INCLUSIVE.

The exports principally consist of the products of the adjacent country. Of these, silk is the most important. Olive oil is also a most important article; but it is principally supplied by Gallipoli, a town in the Terra d'Otranto, whence it is commonly called Gallipoli oil. The entire exports of oil from the kingdom of Naples have been estimated at about 200,000 salme, or 36,333 tons, a year, which, taking its mean value when exported at \$100 per ton, is equivalent to the annual sum of \$3,633,300. See OLIVE OIL. The other articles of export are wool, wine, brandy, dried fruits, red and white argol, tallow, liquorice, gloves, madder, hemp, linseed, cream of tartar, bones, lamb and kid skins, oak and chestnut staves, rags, saffron, etc. There is a great variety in the Neapolitan wines. The most esteemed is the *lacrima Christi*, a red luscious wine, better known in England by name than in reality, the first growths being confined to a small quantity only, which is chiefly reserved for the royal

cellars. There are, however, large quantities of second-rate wines produced in the vicinity of Naples, such as those of Pozzuoli, Ischia, Nola, etc., which are sold under the name of *lacrima Christi*, and are largely exported. Several parts of Calabria produce sweet wines of superior quality.—HENDERSON'S *Ancient and Modern Wines*, p. 239. The price of wine at Naples depends entirely on the abundance of the vintage. The imports consist principally of cottons and cotton twist, hardware, iron and tin, woollens, sugar, coffee, indigo, spices, etc. Naples is a good market for pilchards, and it requires a large supply of dried and barreled cod.

"The existing regulations as to commercial intercourse with the United States appear fixed. When our treaty, however, shall expire, if not renewed, a change may follow, as well for tonnage dues as for the additional 10 per cent. on the duties of merchandise. I know of no privileges permitted to the commerce of other nations which are denied to the United States, nor are there any restrictions on the commerce of other nations and not on the United States. The amount and character of the port charges and other dues levied on vessels of the United States are as follows: *On entry*.—Tonnage, 4 grains, or 3 and one fifth cents per ton, when there is a treaty; without treaty and indirect voyage, 40 grains, or 32 cents per ton. Light money, \$1; presentation of manifest, \$1; custom-house visit, 30 cents; liquidation of manifest and boletta, 35 cents; customary present, 60 cents. Total amount on entry, except tonnage, \$3.75. *On clearance*.—Biglietto of departure, \$1; bill of health, \$1; roll of police, 25 cents; roll of port, 25 cents; usual present, 60 cents; "spedizionieri," or broker's compensation, \$2. Making a total amount on clearance of \$5.10. National vessels pay the same, but the presents are greater by them. The health officer has for granting pratique on arrival \$5. Should the vessel be subject to quarantine, the charges increase according to circumstances, and still more so when sent to Visita to perform it. Transhipment in vessels of the United States of goods, either to another port in the kingdom or to a foreign port is prohibited, as well as in other vessels, except the Neapolitan steamboats. It is allowed by favor when the manifest, on arrival, specifies the goods and the port to which they are intended to be transhipped.

"Exports from this port have been put on board free of any duty, at prices as follows: Refined argols, at 20 cents per pound; refined yellow pink, at 23 cents per pound; cream tartar, at 25 cents per pound; licorice paste (Corigliano) at 16 cents per pound; licorice, Baracco and other, at 15 to 15½ cents per pound; olive oil, in casks, at 78 cents per gallon; oranges, per box, \$2.20 to \$2.25; lemons, \$3 to \$3.20; filberts, 4½ cents per pound; walnuts, 5 cents per pound. There have been exported during the year, from the first of July last, about 60,000 lbs. of sewing silks—first, second, and third qualities—at \$4.20, \$3.80, and \$3.60 per lb. of 16 oz.; also about 25,000 lbs. of such silks, raw or undyed, at \$3 per lb. of 16 oz. These are shipped by steamers for Marseilles or Liverpool for the most part. In like indirect way are also sent clay pipes with reed tubes, of little value, musical strings, coral and lava ornaments, but no prices can be quoted, as their value depends on the beauty of the article, and the execution of the work. Between wholesale and retail prices there may be a difference of about 10 per cent. Five or six foreign vessels (Neapolitan and English) have loaded in part with oranges and lemons for the United States, and gone to Sicily to fill up, or first take a part cargo in Sicily and fill up here. About 20,000 boxes are shipped in the year from this port, but the prices vary continually; they are now double what they were in the beginning of the season."—*Com. Rel. U. S.*, 1856-7.

Commercial Policy.—The policy of the Neapolitan

government with respect to commerce was for a lengthened period the most objectionable that can well be imagined. Articles, whether of import or of export, were burdened, alike, with oppressive duties and restrictions; and even the warehousing of foreign goods could hardly be said to be permitted. Of late, however, we are glad to observe, the administration appears to have become alive to the injurious influence of this *felo de se* system, and has given its sanction to several measures of a comparatively liberal character.

The duties on imports have also undergone various modifications. Those on fish, sugar, and other colonial products, have been reduced fully a half. But we submit in illustration of these changes the following statement of the old and new rates of duty on certain articles:

	Old duty.		New duty.	
	duc.	c.	duc.	c.
Herrings.....cantar gross	5	51	3	0
Codfish....." "	5	7	3	20
Cocoa....." "	16	50	8	0
Coffee....." "	24	75	13	0
Camphor, raw....." "	35	0	24	0
" refined.....rottolo	1	12	0	70
Cinnamon, in sorts....." "	1	54	0	60
Cassia lignea, of any sort.....cantar	50	0	30	0
Cloves....." "	77	0	30	0
Nutmegs....." rottolo	1	54	0	80
Pepper....." "	8	25	7	0
Pilchards, etc.....cantar gross	2	47	1	20
Stockfish....." "	4	63	3	0
Sugar, any kind, in powder....." "	22	0	10	0
" " in loaves....." "	33	0	15	0
Vanilla....." "	2	73	1	80

We have no doubt that the beneficial influence of these wise and liberal measures will lead to further changes. The duties on iron, with those on cottons, woollens, and other descriptions of manufactured goods, are a great deal too high. These duties were imposed partly for the sake of revenue, and partly in the view of encouraging domestic manufactures; but they have not accomplished either object. See TWO SICILIES and ITALY.

Naphtha. A limpid bitumen, which exudes from the earth upon the shores of the Caspian and some other eastern countries. Near the village of Amiano, in the State of Parma, there exists a spring which yields this substance in sufficient quantity to illuminate the city of Genoa, for which purpose it is employed. It has a peculiar odor, and generally a yellow color, but may be rendered colorless by distillation. Its specific gravity is about 0.75. It boils at about 160°. It is highly inflammable, burning with a white smoky flame. It appears to be a compound of 36 of carbon with 5 of hydrogen, and is therefore a pure hydro-carbon. A liquid very similar to mineral naphtha is obtained by the distillation of coal tar. It has sometimes been used in lamps, but is apt to smoke. This variety of naphtha is in great request as a solvent for caoutchouc.

Napier, John, Baron of Merchiston. Celebrated as the inventor of Logarithms. Born 1550, and educated at the university of St. Andrews. On returning from his travels, in 1574, his learning and accomplishments attracted great attention, and would have raised him to the highest offices of State; but, declining all civil employment, he devoted himself to scientific researches and to theology. In 1614 he published his *Logarithmorum Canonis Descriptio*. To Napier science is indebted for considerable improvements in spherical trigonometry, etc. He is principally celebrated, however, by his *Rabdology and Promptuary of Multiplication*, or instruments and tables for the more easy performance of great arithmetical operations, connected with which were the rods of ivory, etc., known as *Napier's bones*. In addition to his scientific treatises, he wrote several works on theological subjects. He died in 1617, in his 68th year, and was buried in the cathedral of St. Giles, at Edinburgh.

Narrows, The, a channel between Long Island and Staten Island, connecting New York Bay with the Atlantic, nine miles south of New York. The channel is 1905 yards wide, and is well defended by forts and batteries.

Natal, a colonial possession of Great Britain, on the south-east coast of Africa, between lat. $27^{\circ} 40'$ and $80^{\circ} 40' S.$, and long. 29° and $31^{\circ} 10' E.$, having south-east the Indian Ocean, west, the Drakenberg, or Kahlamba Mountains, separating it from the territory between the Orange and Vaal Rivers, recently annexed to the Cape Colony; and north-east the Buffalo and Tugela Rivers, dividing it from the Zooloo country. Estimated area, 18,000 square miles. Population uncertain. Surface undulating, well watered, and mostly covered with tall grass. Timber in the interior grows only in clumps, but the sea-coast is bordered by a belt of mangroves. Climate most healthy, and the soil is reported to be far more fertile than in the Cape Colony. Cotton and indigo grow wild, and the former has been produced for exportation, of the finest quality. Sugar, coffee, wheat, oats, beans, and tobacco, are important crops. Superior coal has been found in the interior; building stone is found all over its surface, and iron ore is abundant. Butter, corn, hides, ivory, tallow, tobacco, cotton, and wool, were lately among the chief exports. Value of exports in 1851, \$15,000. Imports same year, valued at \$280,000. The territory, which is a dependency of the Cape of Good Hope, is administered by a lieutenant-governor, assisted by an executive and a legislative council.

It is subdivided into the districts D'Urban, Pietermaritzburg, Umvoti, Impafane, Upper Tugela, and Umzimzate, exclusive of a tract in the south, hitherto without an established magistracy. Pietermaritzburg, the capital, is 50 miles inland from *Port Natal*, which is near the centre of the coast line. This colony derives its name from the fact of its having been discovered on Christmas day (1498), by the Portuguese. It was revisited in 1575 by order of King Sebastian.

National Debt. The first mention of parliamentary security for a debt of the English nation, occurs in the reign of Henry VI. The present national debt commenced in the reign of William III. It had amounted, in the year 1697, to about five millions sterling, and the debt was then thought to be of alarming magnitude.

1702, On the accession of Queen Anne, the debt amounted to.....	£14,000,000
1714, On the accession of Geo. I.....	54,000,000
1749, Geo. II.; after the Spanish war.....	78,000,000
1769, Geo. III.; end of the 7 years' war.....	189,000,000
1786, Three years after the American war.....	268,000,000
1793, The civil and foreign war.....	462,000,000
1802, Close of the French revolutionary war.....	571,000,000
1814, Close of the war against Bonaparte.....	865,000,000
1817, When the Irish and English exchequers were consolidated.....	848,282,477
1830, Total amt of the funded and unfunded debt.....	840,184,022
1840, Total amount of ditto.....	759,575,000
1845, Funded debt.....	765,789,000
1857, ".....	750,000,000

The national debt of the United States originated in consequence of the expenses incurred during the revolutionary war, and amounted in the year 1791 to about \$75,000,000. The revenue of the government enabled it to curtail the debt until the year 1812, when it was only \$45,000,000. The war with England in 1812-15, added largely to this debt, the loans necessary for war expenditures being raised at a considerable loss. At the end of the war the debt was over \$103,000,000. This was rapidly curtailed, and by the year 1835 was fully liquidated, besides an appropriation of several millions of surplus revenue to the individual States. In 1839, the revenue was less than the expenditure, and another debt was created which had been nearly liquidated up to the year 1845, when the war with Mexico rendered further loans necessary. The

progress of the national debt from 1791 to 1857 was as follows:

Years.	Debt—U. S.	Years.	Debt—U. S.
1791.....	\$75,468,476	1824.....	\$90,269,778

For funded debts of various European nations, see *ARTICLE EUROPE*, p. 622.

Naval Architecture. In the small space we can assign to this subject we shall merely endeavor to convey a general notion of the principles and process of construction. Ships are built in different forms, according to the service they are intended for, and the burdens they have to carry. It is in men-of-war, which, besides possessing in an eminent degree the general qualities of a ship, have to support a heavy armament of cannon, and which are destined to severe and long-continued service, that the principles of construction have been carried to the greatest perfection. The form of the ship, her strength, or the scantling necessary for the services required of her, are, from our imperfect knowledge of hydrodynamics, the results of experience alone. When a ship is to be built, her form is projected in three different planes perpendicular to each other.

1st. *The sheer draught*, which is the side view, or projection on the plane of the keel. On this are laid off the length, the heights of all the parts from the keel, the position and rake of the stem and sternpost, the principal frames or timbers of the sides, the ports, decks, channels, place of the greatest breadth or midship frame, stations of the masts, etc. The frames before the midship frame are distinguished by letters; abaft it, by numbers. The midship frame is not exactly in the middle of the length, but rather before it.

2d. *The body plan*, or end view. This shows the contour of the sides of the ship at certain points of her length, and since the two sides are exactly alike, the left half represents the vertical sections in the after part of the body, and the right-hand half those in the fore part. The base of the projection is the midship, or largest section, called also the *dead flat*, within which the other sections are delineated. On this are exhibited also the beams of the decks.

3. The horizontal or floor plane, called also the *half breadth plan*. The base of this is the section made by the horizontal surface of the water and the outside surface of the ship, and is called the *upper water line*, or *load water line*. If the ship now be supposed to be lightened uniformly, she will exhibit another water line, and thus any number of like parallel sections at equal distances down to the keel. On this projection the water lines appear as curves, on the sheer draught as straight lines parallel to the keel. These three sec-

tions correspond to each other upon the same scale, and any point in one is immediately referable to the other two projections. The several parts are drawn from these plans in their full size on the floor of the mold-loft, and worked from the molds or model so taken.

The place in which the ship is built is called a *slip*. In the middle, and leading to the water, is a row of piles of stout pieces of wood called the *blocks*, having a declivity towards the water of about one inch in one foot. On these the keel, which is of elm, is laid, and its component lengths scarfed together. Under the keel is placed the false keel for defense. At the end farthest from the water is raised the *stem*, which is, in fact, the keel continued upwards. Inside the stem, and just above the keel, is the *apron*, a curved timber connecting both. On each side of the upper part of the stem is fixed an upright timber; these are called the *knight heads*, and the bowsprit lies between them. At the other end of the keel is the sternpost, at which the planking finishes abaft, and on which the rudder is hung. Inside (or before this) are the *inner post* and other pieces for strength. Upon the keel is fixed a layer of timber of the same breadth, and rising forward and aft, called the *dead wood*; on this are placed the *floor timbers*; these consist of one which crosses the keel to which it is coaked, and the two parts of a like timber firmly joining it, and projecting beyond its ends. The several pieces are got into their places by shifting shears.

The *frames* consist of pairs of timbers composed of pieces of different lengths, joining the floor timbers, and carried upwards. The length joining the floors is called the first futtock, the next the second futtock, and so on, ending in the *top timbers*. The pairs are bolted by iron bolts, and of late adjacent pairs have been thus connected. The frames are supported temporarily by being fixed to the *cross spalls*, long fir planks laid horizontally about the height of the gun deck. Those frames whose planes are perpendicular to the keel are called *square frames*; at the head and stern these planes incline toward the extremities, and are called *cant frames*. These divisions of the ship are called, accordingly, *square* and *cant bodies*. When the framing has assumed its form the *ribbands* are fixed; these are thick, narrow planks at wide intervals, extending the length of the vessel, marking the direction of the planks; they are firmly shored, and removed when the planking comes on. The *riband lines* appear on the half breadth plan as diagonal lines. Upon the keel, and over the floor timbers, to which it is scored, is laid the *kelson*, which is, in fact, a second keel over the first. The stern of square-sterned ships is formed upon the *wing transom*, the uppermost of the horizontal pieces of timber, called *transoms*, crossing the sternpost inside. The wing transom is secured to the timbers of the side by a strong horizontal knee. When the framing is complete, the outside planking is laid on. The *wales*, thick planks above the water, are first secured to the ribs. The *clamps* are thick planks inside, to support the ends of the beams of the decks. The *beams* support the decks, rest on the clamps, and are secured to the side by *knees*. The *breast hooks* are strong curved pieces of timber crossing the stem, and joining the bows. The *deck hooks* are the same, being at the decks. The *crutches* answer a like purpose below in the after part. The *port sills* are the upper and lower edges of the ports. The *spirketting* is the plank of the side between the water way and the port sill. The *chain wales* are thick planks of the outside to receive the chains and preventer-bolts for the support of the rigging. The *foot waling*, or *ceiling*, is the plank lining the inside of the ship below. The *limber boards* are short, thick pieces of wood resting against the kelson for the convenience of keeping a clear passage to the well. The *knee of the head*, also called the *cut-water*, is the projecting part of the head; it is secured to the bows by knees called *cheeks*.

In order to bend wood into the necessary curvature, it is steamed in places for the purpose. When the planking is all complete, the ship is caulked and painted. The fastenings of timber are effected by bolts, treenails, or coaks. The present method of framing ships-of-war is chiefly due to Sir Robert Seppings. We shall describe it here generally; for particulars, see the *Phil. Trans.*, 1814, and the published reports on the subject. As the timbers or ribs can not be procured entire, or of the proper curvature, various methods have been used for joining the several pieces together. A method used till lately consisted of an angular chock C, fastened by treenails to the ends A B of the timbers. By this plan all stress upon the joint, in whatever direction, falls on the treenails; and when the chock decays, no support is afforded in any sense whatever. At present the square ends, A' B', are brought together, while a *coak* C', or small oak cylinder, is let into each.

By this plan the two faces resist any effort by pressure from without to close the timbers, and the coak itself resists the effort (perpendicular to this last) to make one timber slide past the other by the whole force necessary to cut it off flush with the section. In the single case of lifting one face exactly perpendicularly off the other, the coak offers no resistance; this effort, which is that produced by the strain of the rigging on the sides, is opposed by other numerous connections. The method is very ancient, being used in the construction of the pillars in the temple at Balbec; the advantages of its application to ship-building is seen in the frames, which undergo no change of form while hoisting into their places. The efficiency of the plan, however, does not appear in a single length, but in the system of frames, each joining of which is placed near the middle of the next piece.

A *shelf piece*, coaked and bolted to the timbers or ribs, and resting on short vertical pieces of timber called *chocks*, and sometimes scored to the ribs, is carried like a hoop entirely round the ship. On this the beam ends are coaked; and over these again is laid a strong water way scored to the beams, and coaked. Besides these the beam end is clasped by two arms of an iron knee, of which the third, which is vertical, is bolted to the chock. The shelf binds firmly the ends and sides of the ship together, and resists like an arch all external pressure. The spaces between the timbers below are filled up by dry wood driven in tight, and caulked, thus rendering the bottom solid and water-tight, independently of the planking. One of the most important improvements is the diagonal framework below. Instead of the former planking in the hold are placed *braces*, crossing the ribs, to which they are coaked, at an angle of 45° ; those in the fore body incline (or rake) aft, and those in the after body forward. They butt against the kelson, and extend nearly to the water; they are in general placed under every other beam, but closer at the extremities.

Longitudinal pieces of timber are laid nearly parallel to the keel over the heads or joinings of the timbers, and bolted through; these, crossing the diagonals, form a series of rhomboidal figures, across which, inside, are firmly driven *trusses*, lying the opposite way from the diagonals; these are bolted through, and, when necessary, are further tightened by driving in thin iron plates at the ends. The diagonals act by the *tension* of the fibres, the trusses by the *thrust*, and the whole thus resists every effort to change the figure of the ship. The system was first put into complete practice in the *Tremendous*, 74, in 1810; which ship evinced, in several severe trials, a firmness and dryness not known before. M. C. Dupin has shown (*Phil. Trans.*, 1817) that the principle of diagonal framing had sug-

gested itself, and been tried by several French engineers, but as often abandoned. The merit, therefore, of Sir R. Seppings, in reducing to practice a system which to others had been attended with insuperable difficulties, more than compensates the want of novelty in the idea itself. The ancient square, massive, but weak sterns, have been replaced by Sir R. Seppings by round sterns, corresponding in construction, and therefore in strength, to the bow. These have again undergone various alterations, tending to combine the strength of the new with the imposing appearance of the former stern. It is only now by contrasting the solid and immovable frame with the former weak and unconnected structure, that we can fully perceive the inefficiency of the ancient construction. The timbers, instead of forming an independent system, were often supported in part by the planking itself, as is the case in boats. The masts, resting only upon their steps, instead of strong platforms which diffuse the pressure on all sides, and pressed downwards by their weight, and by the enormous strain of the rigging, arising from the wind on the sails, forced the keel down, and made the ship leaky. The timbers and framework, being at right angles, without mutual support, the whole stress of the ship came on the fastenings; and, lastly, the safety of the ship depended entirely upon that of the outside plank, the part most exposed to injury.

The planks of the decks have also sometimes been placed diagonally; and lately iron diagonal straps have been added to the upper works inside. The extremities being unsupported below by the water droop, or the ship *hogs*, a three-decker formerly drooped at once, on being launched, nine inches at each end, which increased with her length of service; at present, such a ship droops only $3\frac{1}{2}$ inches, which, when the materials are set, suffers little or no increase. Exposure to moisture being a cause of the decay of timber, building under cover has long been practiced. This also protects the men from the weather. The wood usually employed in ship-building is oak. Elm, which does not split readily, is employed for the keel, and for the caps. East India teak, a very heavy durable wood, which does not shrink, nor is liable to splinter from shot, is now very much used. African teak is also much used. Fir is used for light works, masts, etc. The bottoms of ships are liable to become covered with weeds and shells, and to be eaten through by worms. To prevent these evils, the bottoms were formerly covered with a thin sheathing of wood, which was replaced when worn. Lead has also been used. Ships are now sheathed almost universally with thin sheets of copper.

For further information on this subject, reference may be made to the following works: BOUGUER, *Traité du Navire*; CLAIRBOIS, *Traité Elementaire, etc.*; CHAPMAN's *Naval Archit.*, with Notes by Dr. INMAN; STEEL's *Elements*, with an Appendix, by J. KNOWLES, F.R.S.; FINCHAM's *Outlines of Ship-building*; the article "Ship-building" in the new edition of the *Ency. Britannica*.

Naval Courts are tribunals established as occasion may require, either on the high seas or in foreign parts, or at home, for inquiring into and dealing with various matters pertaining to maritime affairs.

Naval Stores. The principal of these are tar, pitch, rosin and turpentine, though other articles used in building and equipping vessels are sometimes included. The United States are so abundantly supplied with naval stores, that notwithstanding she is more extensively employed in ship-building than any other nation, she exports naval stores in large quantities.

Navigation (Lat. *navis*, a ship), is that branch of science by which the mariner is taught to conduct his ship from one part or place to another. To understand the principles of navigation, and their practical application, it is necessary that the mariner should be acquainted with the form and magnitude of the earth, the relative situations of the lines conceived to be drawn on its surface, and have charts of the coasts and maps of the harbors which he may have occasion to visit. He must also understand the use of the instruments by which the direction in which a ship is steered, and the distance which she sails, are ascertained; and be able to deduce from the data supplied by such instruments the situation of his ship at any time, and to find the direction and distance of any place to which it may be required that the ship should be taken. A curve passing through any two places on the earth, and cutting every intervening meridian at the same angle, is called a *rumb line*; the angle which such a curve makes with each meridian is called the *course* between any two places through which the curve passes; and the arc of that curve intercepted between any two places is called their *nautical distance*. This distance is more than that measured on the arc of a great circle passing through the two places, un-

less both places are on the same meridian, or both on the equator, when the rhumb line and great circle coincide. The *difference of latitude* between any two places is an arc of a meridian intercepted between the parallels of latitude on which the places are situated; and the *difference of longitude* is the arc of the equator, or the angle at the pole included between the meridians of the places. Hence, when the latitudes or the longitudes of two places are of the same denomination with respect to *north or south, east or west*, the difference is found by subtracting the less from the greater; but when of different denominations, what is called their difference is found by taking their sum. See LATITUDE, LONGITUDE.

Navigation owes its origin to the Phenicians, about 1500 B.C. The first laws of navigation originated with the Rhodians, 916 B.C. The first account we have of any considerable voyage is that of the Phenicians sailing round Africa, 604 B.C.—BLAIR. On the destruction of Thebes by Alexander the Great, 335 B.C. its commerce passed to Alexandria, and subsequently the Romans became the chief masters of commerce. It passed successively from the Venetians, Genoese, and Hanse Towns, to the Portuguese and Spaniards; and from these to the English and Dutch.—HAYDN.

Navigation Laws. These laws form an important branch of maritime law. In this country they are understood to comprise the various acts that have been passed, defining the way in which ships are to be manned, the peculiar privileges enjoyed by them, and the conditions under which foreign ships shall be allowed to engage in the trade of the country, either as importers or exporters of commodities, or as carriers of commodities from one part of the country to another.

Sketch of the History and Principles of the Navigation Laws.—The origin of the navigation laws of England, which are the foundation of ours, may be traced to the reign of Richard II., or perhaps to a still more remote period. But, as no intelligible account of the varying and contradictory enactments framed at so distant an epoch could be compressed within any reasonable space, it is sufficient to observe, that in the reign of Henry VII., two of the leading principles of the navigation law were distinctly recognized, in the prohibition of the importation of certain commodities, unless imported in ships belonging to, English owners, and manned by English seamen. In the early part of the reign of Elizabeth (5 Eliz. c. 5), foreign ships were excluded from the fisheries and coasting trade. The republican Parliament gave a great extension to the navigation laws, by the act of 1650, which prohibited all ships, of all foreign nations whatever, from trading with the plantations in America, without having previously obtained a license. These acts were, however, rather intended to regulate the trade between the different ports and dependencies of the empire, than to regulate intercourse with foreigners. But in the following year (9th of October, 1651), the republican Parliament passed the famous *Act of Navigation*. This act had a double object. It was intended not only to promote British navigation, but also to strike a decisive blow at the naval power of the Dutch, who then engrossed almost the whole *carrying trade* of the world, and against whom various circumstances had conspired

to incense the English. The act in question declared, that no goods or commodities whatever, of the growth, production or manufacture of Asia, Africa or America, should be imported either into England or Ireland, or any of the plantations, except in ships belonging to English subjects, and of which the master and the greater number of the crew were also English. Having thus secured the import trade of Asia, Africa and America, to the English ship-owners, the act went on to secure to them, as far as that was possible, the import trade of Europe. For this purpose, it further enacted, that no goods of the growth, production, or manufacture of any country in Europe, should be imported into Great Britain, except in British ships, or in such ships as were the real property of the people of the country or place in which the goods were produced, or from which they could only be, or most usually were, exported. The latter part of the clause was entirely leveled against the Dutch, who had but little native produce to export, and whose ships were principally employed in carrying the produce of other countries to foreign markets. Such were the leading provisions of this famous act. They were adopted by the regal government which succeeded Cromwell, and form the basis of the act of the 12th Car. 2, which continued, to a very recent period, to be the rule by which naval intercourse with other countries was mainly regulated; and has been pompously designated the *Charta Maritima* of England!

American View of the Rights of Navigation.—The liberty of passage to be enjoyed by one nation through the dominions of another, was treated by the most eminent writers on public law, as a qualified, occasional exception to the paramount rights of property. They made no distinction between the right of passage by a river, flowing from the possessions of one nation through those of another, to the ocean, and the same right to be enjoyed by means of any highway, whether of land or water, generally accessible to the inhabitants of the earth. The right of passage, then, must hold good for other purposes, besides those of trade; for objects of war as well as for those of peace; for all nations, no less than for any nation in particular, and be attached to artificial as well as to natural highways. The principle could not, therefore, be insisted on by the American government, unless it was prepared to apply the same principle by reciprocity, in favor of British subjects, to the navigation of the Mississippi and the Hudson, access to which from Canada might be obtained by a few miles of land carriage, or by the artificial communication created by the canals of New York and Ohio. Hence the necessity which has been felt by the writers on public law, of controlling the operation of a principle so extensive and dangerous, by restricting the right of transit to purposes of innocent utility, to be exclusively determined by the local sovereign. Hence the right in question is termed by them an imperfect right. But there was nothing in these writers, or in the stipulations of the treaties of Vienna, respecting the navigation of the great rivers of Germany, to countenance the American doctrine of an absolute natural right. These stipulations were the result of mutual consent, founded on considerations of mutual interest growing out of the relative situation of the different States concerned in this navigation. The same observation would apply to the various conventional regulations which had been at different periods applied to the navigation of the River Mississippi. As to any supposed right derived from the simultaneous acquisition of the St. Lawrence by the British and American people, it could not be allowed to have survived the treaty of 1783, by which the independence of the United States was acknowledged, and a partition of the British dominions in North America was made between the new government and that of the mother country.

This argument, it was replied, on the part of th

United States, that, if the St. Lawrence were regarded as a strait connecting navigable seas, as it ought probably to be, there would be less controversy. The principle on which the right to navigate straits depends, is, that they are accessorial to those seas which they unite, and the right of navigating which is not exclusive, but common to all nations; the right to navigate the seas drawing after it that of passing the straits. The United States and Great Britain have between them the exclusive right of navigating the lakes. The St. Lawrence connects them with the ocean. The right to navigate both (the lakes and the ocean), includes that of passing from one to the other through the natural link. Was it then reasonable or just that one of the two co-proprietors of the lakes should altogether exclude his associate from the use of a common bounty of nature, necessary to the full enjoyment of them? The distinction between the right of passage, claimed by one nation through the territories of another, on land, and that on navigable water, though not always clearly marked by the writers on public law, has a manifest existence in the nature of things. In the former case, the passage can hardly ever take place, especially if it be of numerous bodies, without some detriment or inconvenience to the State whose territory is traversed. But in the case of a passage on water no such injury is sustained. The American government did not mean to contend for any principle, the benefit of which, in analogous circumstances, it would deny to Great Britain. If, therefore, in the further progress of discovery, a connection should be developed between the Mississippi and Upper Canada, similar to that which exists between the United States and the St. Lawrence, the American government would be always ready to apply, in respect to the Mississippi, the same principles it contended for in respect to the St. Lawrence. But the case of rivers, which rise and debouch altogether within the limits of the same nation, ought not to be confounded with those which, having their sources and navigable portions of their streams in States above, finally discharge themselves within the limits of other States below. In the former case, the question as to opening the navigation to other nations, depended upon the same considerations which might influence the regulation of other commercial intercourse with foreign States, and was to be exclusively determined by the local sovereign. But in respect to the latter the free navigation of the river was a natural right in the upper inhabitants, of which they could not be entirely deprived by the arbitrary caprice of the lower State. Nor was the fact of subjecting the use of this right to treaty regulations, as was proposed at Vienna to be done in respect to the navigation of the European rivers, sufficient to prove that the origin of the right was conventional, and not natural. It often happened to be highly convenient, if not sometimes indispensable, to avoid controversies, by prescribing certain rules for the enjoyment of a natural right. The law of nature, though sufficiently intelligible in its great outlines and general purposes, does not always reach every minute detail which is called for by the complicated wants and varieties of modern navigation and commerce. Hence the right of navigating the ocean itself, in many instances, principally incident to a state of war, is subjected, by innumerable treaties, to various regulations. These regulations—the transactions of Vienna, and other analogous stipulations—should be regarded only as the spontaneous homage of man to the permanent Lawgiver of the universe, by delivering his great works from the artificial shackles and selfish contrivances to which they have been arbitrarily and unjustly subjected.—WHEATON'S *International Law*, pp. 263-266.—[This chapter in MR. WHEATON'S work furnishes the best view, in brief, of the rights of navigation of the St. Lawrence, the Mississippi, the Rhine, and of the rights of Territory.—EDS. C. OF C.]

Laws of trade and navigation can not affect foreigners, beyond the territorial limits of the State, but they are binding upon its citizens, wherever they may be. Thus, offenses against the laws of a State, prohibiting or regulating any particular traffic, may be punished by its tribunals, when committed by its citizens, in whatever place; but if committed by foreigners, such offenses can only be thus punished when committed within the territory of the State, or on board of its vessels, in some place not within the jurisdiction of any other State.—WHEATON, *Int. Law*, p. 175.

Claims to Portions of the Sea upon the Ground of Prescription.—Besides those bays, gulfs, straits, mouths of rivers, and estuaries which are inclosed by capes and headlands belonging to the territory of the State, a jurisdiction and right of property over certain other portions of the sea have been claimed by different nations, on the ground of immemorial use. Such, for example, was the sovereignty formerly claimed by the republic of Venice over the Adriatic. The maritime supremacy claimed by Great Britain over what are called the Narrow Seas, has generally been asserted merely by requiring certain honors to the British flag in those seas, which have been rendered or refused by other nations, according to circumstances, but the claim itself has never been sanctioned by general acquiescence. Straits are passages communicating from one sea to another. If the navigation of the two seas thus connected, is free, the navigation of the channel by which they are connected ought also to be free. Even if such strait be bounded on both sides by the territory of the same sovereign, and is at the same time so narrow as to be commanded by cannon shot from both shores, the exclusive territorial jurisdiction of that sovereign over such strait is controlled by the right of other nations to communicate with the seas thus connected.

Such right may, however, be modified by special compact, adopting those regulations which are indispensably necessary to the security of the State whose interior waters thus form the channel of communication between different seas, the navigation of which is free to other nations. Thus the passage of the strait may remain free to the private merchant vessels of those nations having a right to navigate the seas it connects, while it is shut to all foreign armed ships in time of peace.—WHEATON'S *Int. Law*, pp. 288-240.

Navigation of the Mississippi.—By the treaty of peace concluded at Paris in 1763, between France, Spain, and Great Britain, the province of Canada was ceded to Great Britain by France, and that of Florida to the same power by Spain, and the boundary between the French and British possessions in North America was ascertained by a line drawn through the middle of the River Mississippi, from its source to the Iberville, and from thence through the latter river and the lakes of Maurepas and Pontchartrain to the sea. The right of navigating the Mississippi was at the same time secured to the subjects of Great Britain from its source to the sea, and the passages in and out of its mouth, without being stopped or visited, or subjected to the payment of any duty whatsoever. The province of Louisiana was soon afterward ceded by France to Spain; and by the treaty of Paris, 1763, Florida was retroceded to Spain by Great Britain. The independence of the United States was acknowledged, and the right of navigating the Mississippi was secured to the citizens of the United States and the subjects of Great Britain by the separate treaty between these powers. But Spain, having thus become possessed of both banks of the Mississippi at its mouth, and a considerable distance above its mouth, claimed its exclusive navigation below the point where the southern boundary of the United States struck the river.

This claim was resisted, and the right to participate

in the navigation of the river from its source to the sea was insisted on by the United States, under the treaties of 1763 and 1783, as well as by the law of nature and nations. The dispute was terminated by the treaty of San Lorenzo el Real, in 1795, by the 4th article of which his Catholic majesty agreed that the navigation of the Mississippi, in its whole breadth, from its source to the ocean, should be free to the citizens of the United States; and by the 22d article they were permitted to deposit their goods at the port of New Orleans, and to export them from thence, without paying any other duty than the hire of the warehouses. The subsequent acquisition of Louisiana and Florida by the United States having included within their territory the whole river from its source to the Gulf of Mexico, and the stipulation in the treaty of 1783, securing to British subjects a right to participate in its navigation, not having been renewed by the treaty of Ghent in 1814, the right of navigating the Mississippi is now vested exclusively in the United States.—WHEATON'S *Int. Law*, pp. 257, 258. The navigation of the continuous waters of the United States and Canada is provided for in the following articles of the treaty of June 5, 1854. The third article, whose operation may be affected at the will of the American government, by a suspension of this privilege, as stipulated in the fourth article, on the part of Great Britain, provides for a reciprocal trade, free of duty, between the United States and the British colonies, in the articles of their respective growth and produce, as enumerated in the schedule thereto annexed.

"It is agreed that the citizens and inhabitants of the United States shall have the right to navigate the River St. Lawrence and the canals in Canada, used as the means of communicating between the Great Lakes and the Atlantic Ocean, with their vessels, boats, and crafts, as fully and freely as the subjects of her Britannic majesty, subject only to the same tolls and other assessments as now are, or may hereafter be, exacted of her majesty's said subjects; it being understood, however, that the British government retains the right of suspending this privilege on giving due notice thereof to the government of the United States. It is further agreed, that if at any time the British government should exercise the said reserved right, the government of the United States shall have the right of suspending, if it think fit, the operation of article 3, of the present treaty, in so far as the province of Canada is affected thereby, for so long as the suspension of the free navigation of the River St. Lawrence or the canals may continue. It is further agreed that British subjects shall have the right freely to navigate Lake Michigan with their vessels, boats, and crafts, so long as the privilege of navigating the River St. Lawrence, secured to Americans by the above clause of the present article, shall continue; and the government of the United States further engages to urge upon the State governments to secure to the subjects of her Britannic majesty the use of the several State canals, on terms of equality with the inhabitants of the United States."—WHEATON'S *Int. Law*, pp. 266, 267. [A full understanding of this subject, and of the able views of Mr. WHEATON, can be had only by a careful reading of his elaborate and highly-prized work on *International Law*.—EDS. C. of C.]

Navigators' Islands, a group of islands in the southern Pacific Ocean, remarkable for their extent, fertility, and population. They are about 10 in number, and are situated between 169° and $172^{\circ} 30'$ W. long., and from lat. $13^{\circ} 25'$ to an uncertain boundary southward. When seen from the ocean, they present a lofty appearance, and are mountainous, but neither surrounded with a low border nor inclosed by reefs, like the Society Islands. The first discovery of these islands was made in 1722, by Roggewin and Banman, who fell in with the easternmost of the number; while Bougainville, in 1768, added another; and Perouse, in

1787, discovered the two westernmost, which are the largest, being more than 40 miles in length. The last navigator was informed of three more to the southward. The whole group was visited in 1791 by Captain Edwards. The inhabitants are a stout and well-made race, of the ordinary height of 5 feet 9 or 11 inches. They are altogether savage in their manners, which are said to be remarkably indecent. They are also of the most ferocious disposition. The least dispute between them is followed by blows from clubs, sticks, or paddles, and is often attended with the loss of life. They are very ingenious, and fashion their work dexterously with hatchets shaped like adzes, and made of very fine and compact basalt. With these they finish works in wood, and give them so high a polish that they appear to be coated with the finest varnish. They also manufacture a species of cloth which possesses great strength and pliability, and is well calculated for the sails of canoes. The name of Navigators' Islands was bestowed by Bougainville, from the practice which prevails among the inhabitants of continually traveling in canoes. We have no data upon which we can calculate the amount of the population, but it must be considerable, considering that these islands are among the most fertile in the South Seas.

Navy Department. The Navy Department was created by an act of Congress, 30th April, 1798, and is under the direction of the Secretary of the Navy. The Department conducts its business in several bureaux, namely, the Bureau of Docks and Navy Yards; the Bureau of Ordnance and Hydrography; the Bureau of Construction, Equipments, and Repairs; the Bureau of Provisions and Clothing; the Bureau of Medicine and Surgical Instruments, etc.; and the National Observatory at Washington is under the charge of this Department. The ministerial duties of these several bureaux were formerly exercised by a Board of Navy Commissioners.

Secretaries of the Navy.—George Cabot, Mass., May 3, 1798; Benjamin Stoddard, Md., May 21, 1798; Robert Smith, Md., January 26, 1802; Jacob Crowninshield, Mass., March 2, 1805; Paul Hamilton, S. C., March 7, 1809; William Jones, Penn., January 12, 1813; Benjamin W. Crowninshield, Mass., December 17, 1814; Smith Thompson, N. Y., November 30, 1818; Samuel L. Southard, N. J., December 9, 1823; John Branch, N. C., March 9, 1829; Levi Woodbury, N. H., August, 1831; Mahlon Dickerson, N. J., June 30, 1834; James K. Paulding, N. Y., June 30, 1838; George E. Badger, N. C., March 5, 1841; Abel P. Upshur, Va., September 13, 1841; David Henshaw, Mass., July 24, 1843; Thomas W. Gilmer, Va., February 15, 1844; John Y. Mason, Va., March 14, 1844; George Baneroff, Mass., March 10, 1845; John Y. Mason, Va., 1846; William B. Preston, Va., March 7, 1849; William A. Graham, N. C., July 20, 1850; James C. Dobbin, N. Navy Yards of the United States.—Portsmouth, Charlestown, Brooklyn, Philadelphia, Washington, Gosport, Pensacola.

Navy Dry Docks.—Charlestown, Brooklyn, N. Y., Pensacola, Gosport.

United States' Navy Squadrons.—East Indian, Pacific, African, Brazilian, Mediterranean, Home (West Indies).

Navy Hospitals.—Chelsea, Mass., New York, Portsmouth, Va., Pensacola.

Naval Magazines.—Charlestown, Mass., New York, Washington, Norfolk, Pensacola.

National Observatory, Washington; Naval Academy, Annapolis; Naval Asylum, Philadelphia.

Navy. The first fleet of galleys, like those of the Danes, was built by Alfred, A.D. 897. In the time of Henry VIII. the British navy consisted of 1 ship of 1200 tons, 2 of 800 tons, and 6 or 7 smaller; the largest was called the *Great Harry*. Elizabeth's fleet at

the time of the Spanish Armada, in 1588, consisted of only 28 vessels, none larger than frigates. James I. added 10 ships of 1400 tons each, and 64 guns, the largest then ever built.—GIBSON'S *Camden*.

ACCOUNT OF THE PROGRESSIVE INCREASE OF THE ROYAL NAVY OF ENGLAND FROM HENRY VIII'S REIGN TO THE CLOSE OF THE WAR, 1814.

Year.	Ships.	Tons.	Men voted.	Navy estimate.
1521	16	7,260	...	no account.
1578	24	10,506	6,700	"
1608	42	17,055	8,346	"
1658	157	57,000	21,910	"
1688	178	101,892	42,000	"
1702	272	159,020	40,000	£1,056,915
1760	412	321,184	70,000	8,227,143
1793	498	433,326	45,000	5,525,381

1808	869	892,500	143,500	17,496,047
1814	901	966,000	146,000	18,786,509

Neap, or Neep Tides, are the lowest tides, being those which are produced when the attractions of the sun and moon on the waters of the ocean are exerted in directions perpendicular to each other. When the two forces act in the same or exactly opposite directions, the *spring* or highest tides are produced. The neap tides take place about four or five days before the new and full moons. See **TIDES**.

Needles. They make a considerable article of commerce, as well as of home trade in England. German and Hungarian steel is of most repute for needles. The first that were made in England were fabricated in Cheapside, London, in the time of the sanguinary Mary, by a negro from Spain; but, as he would not impart the secret, it was lost at his death, and not recovered again till 1566, in the reign of Elizabeth, when Elias Growse, a German, taught the art to the English, who have since brought it to the highest degree of perfection.—*Stow*. The family of the Greenings, ancestors of Lord Dorchester, established a needle manufactory in Bucks about this time.—*ANDERSON*.

Needles are made from the best steel, reduced by a wire-drawing machine to the suitable diameter. The manufacture is supposed to have originated in Spain, and to have been introduced into England about the year 1565, by Elias Krause, or Growse, who then settled in London. Dr. Ure, in his *Dictionary of Arts*, states that "the construction of a needle requires about 120 operations; but they are rapidly and uninterruptedly successive. A child can trim the eyes of 4000 needles per hour. When we survey a manufactory of this kind, we can not fail to observe that the diversity of operations which the needles undergo bears the impress of great mechanical refinement. In the arts, to divide labor is to abridge it; to multiply operations is to simplify them; and to attach an operative exclusively to one process, is to render him much more economical and productive."—*E. A.*

Nests, Esulent. A species of nests built by swallows peculiar to the Indian Islands, and very much esteemed in China and other parts of the world. These nests resemble in form those of other swallows; they are formed of a viscid substance, and in external appearance as well as consistence are not unlike fibrate il-concocted isinglass. Esulent nests are principally found in Java, in caverns usually situated on the sea-coast. Nothing satisfactory is known as to the substance of which these nests are composed.

Net (*Fr. Filet, reseau; Ger. Netz*), is a textile fabric of knotted meshes for catching fish and other purposes. Each mesh should be so secured as to be incapable of enlargement or diminution. The French government offered in 1802 a prize of 10,000 francs to the person who should invent a machine for making nets upon automatic principles, and adjudged it to M. Buron, who presented his mechanical invention to the *Conservatoire des Arts Mètièrs*. It does not appear, however, that this machine has accomplished the object in view; for no establishment was ever mounted to carry it into execution. Nets are usually made by the fishermen and their families during the periods of leisure. The formation of a mesh is too simple a matter to require description in this dictionary.

Nett (*It. netto, pure*), that which remains of a weight, quantity, etc., after making certain deductions. Thus, in mercantile language, the *nett weight* is the weight of any article after deducting tare and tret; *nett profits, incomè, etc.*, is the absolute profit or income, after deducting expenses, interest, etc. It is opposed to *gross* (*brutto*).

Nettings, in a ship, a sort of grates made of small ropes seized together with rope-yarn, or twine, and fixed upon the quarters and in the tops. They are sometimes stretched upon the ledges from the waist-trees to the roof-trees, from the top of the fore-castle to the poop, and sometimes are laid in the waist of a ship to serve instead of gratings.

Netherlands (Kingdom of the), or Holland (*Du. Koninkrijk der Nederlanden; Fr. Royaume des Pays Bas*), a State of western Europe, on the German Ocean (capital Amsterdam), composed of the Netherlands proper, or the ancient republic of the Seven United Provinces, and part of the Duchy of Limburg, situated between lat. 50° 48' and 59° 21' N., and long. 3° 24' and 7° 12' E., bounded east by Hanover and Prussia, south by Belgium and the Grand Duchy of Luxemburg (the south-east portion of which is held by the King of the Netherlands), and west and north by the German Ocean. Extent and population as follows:

The leading features of the new navigation laws of the Netherlands may be gathered from the following summary: 1. Unconditional repeal of discriminating favors granted to the Dutch flag, by suppression of the rules allowing to this flag preference above foreign flags. 2. Conditional similarity of flag in the navigation to and from the Netherlands' colonies. 3. Stipulations by law concerning the trade and navigation in the colonies of the realm carried on by other nations. 4. Repeal of interdiction to grant Netherlands registers to foreign-built vessels, by their admittance for registry (naturalization) at a duty of 4 per cent. of their value. 5. Diminishing of import duties on principal materials for ship-building. 6. Suspension of the shipping duties on the Rhine and Yssel. 7. Total abolition of transit duties.

Public revenue, in 1853, 71,685,772 florins, of which amount nearly half is raised by direct taxation and excise duties. Expenditure, 70,985,078 florins. National debt, 1,206,493,330 florins. The marine force in

actual service on 1st July, 1852, comprised 6087 men, exclusive of those in the colonies. The merchant marine is comprised of 2000 vessels, aggregate burden 20,000 lasts. The following table shows the extent and population of the colonial possessions of the kingdom of the Netherlands in 1849 :

The Netherlands is a name, which, for several centuries, was applied to the countries now forming the kingdoms of Belgium, and the Netherlands, and part of the north of France (Departments Nord and Pas-de-Calais). This country belonged almost entirely to Charles V. United to Franche-Comté, it formed the circle of Burgundy. From this seven of the north provinces separated themselves in 1579, and formed the republic of Holland, or the Seven United Provinces. Part of the low country was conquered by Louis XIV., and called the French Netherlands; the rest, first under the dominion of Spain, passed in 1714 to that of Austria, and was called Spanish Netherlands, Austrian Netherlands, or Belgium.

The fisheries formed the origin of prosperity in the Netherlands, and the herrings prepared by the Dutch still maintain their superiority. In 1842, 1603 boats, manned by 8280 men, were employed in this fishery. The whale fishery in the Sea of Spitzbergen has been profitably carried on since the 16th century. The manufacturing industry of the country is very active, Holland having long been celebrated for its linens, velvets, and paper; and during the 17th and 18th centuries, its typography enjoyed a well-merited reputation. The absence of cold, and the prevalence of strong winds, have led to the adoption of the wind-mill as a motive power, and it is universally employed in all kinds of work. The chief manufactures are linen of the finest quality, woollens, silks, and velvets, paper, leather, cordage, hats, ribbons, saltpetre, and tobacco. The manufacture of cotton has been recently introduced. There are numerous distilleries of "Geneva" (rather jenever, from the juniper berry, with which the gin is flavored), or "Hollands," and extensive bleach fields, brick and tile works. Holland presents the appearance of an immense net-work of canals, which form the usual access not only to towns and villages, but even to private mansions. The most important is that of North Holland, between Amsterdam and the Helder, the finest work of the kind in Europe, 50 miles in length, 125 feet broad at the surface, and 21 feet in depth. By means of this important work, ships bound for Amsterdam avoid the danger and delay of navigating the Zuyder Zee; it is spacious enough to admit 2 frigates abreast. Since not only

the surface but the bed of many of the canals is above the level of the land, the drainage of the *polders* or meadows, through which they pass, is an object of great solicitude; it is effected by means of pumps worked by wind-mills. In a country where human industry is engaged in a continual struggle with the sea, from the domains of which it has been conquered, the management of dykes, canals, and roads, is a special object of attention on the part of the government. The roads, which are always formed on the dykes and bordered by canals, are excellent. In 1849 lines of railroad were completed from Amsterdam west to Harlem, and south to Leyden, the Hague, and Rotterdam, and south and east by Utrecht to Arnhem. The principal imports consist of colonial products and manufactured goods, corn, wines, cotton, wool, and leather, valued in 1851 at 303,993,224 florins. Chief exports are butter, cheese, dried fish, gin, the manufactures of the country, and colonial produce; valued at 242,744,806 florins.

A letter from the United States' consul at the Hague gives the annexed information, under date of July 20, 1855: "The second Chamber has, by a vote of 43 to 7, passed the bill abolishing the tonnage dues. The deficit in the revenues, caused by this bill, is calculated at 500,000 francs a year, and is to be covered by an additional excise duty on refined sugar, which has also been passed by the Chamber. The abolition of the tonnage dues, and of the still more vexatious malt tax, has been hailed throughout the country with joy as an indication of a progressive policy, to which the present ministry has appeared but little inclined till now."

Neutrals. *Of the General Rights and Duties of Neutral Nations.*—The rights and duties which belong to a state of neutrality form a very interesting title in the code of international law. They ought to be objects of particular study in this country, inasmuch as it is our true policy to cherish a spirit of peace, and to keep ourselves free from those political connections which would tend to draw us into the vortex of European contests. A nation that maintains a firm and scrupulously impartial neutrality, and commands the respect of all other nations by its prudence, justice, and good faith, has the best chance to preserve unimpaired the blessings of its commerce, the freedom of its institutions, and the prosperity of its resources. Belligerent nations are interested in the support of the just rights of neutrals, for the intercourse which is kept up by means of their commerce contributes greatly to mitigate the evils of war. The public law of Europe has established the principle, that, in time of war, countries not parties to the war, nor interposing in it, shall not be materially affected by its action; but they shall be permitted to carry on their accustomed trade, under the few necessary restrictions which we shall hereafter consider.

A neutral has a right to pursue his ordinary commerce, and he may become the carrier of the enemy's goods, without being subject to any confiscation of the ship, or of the neutral articles on board; though not without the risk of having the voyage interrupted by the seizure of the hostile property. As the neutral has a right to carry the property of enemies in his own vessel, so, on the other hand, his own property is inviolable, though it be found in the vessels of enemies. But the general inviolability of the neutral character goes further than merely the protection of neutral property. It protects the property of the belligerents when within the neutral jurisdiction. It is not lawful to make neutral territory the scene of hostility, or to attack an enemy while within it; and if the enemy be attacked, or any capture made, under neutral protection, the neutral is bound to redress the injury, and effect restitution. The books are full of cases recognizing this principle of neutrality.—*KENT's Com.*

Prizes brought into Neutral Ports.—A neutral has no right to inquire into the validity of a capture, except in cases in which the rights of neutral jurisdiction were violated; and, in such cases, the neutral power will restore the property, if found in the hands of the offender, and within its jurisdiction, regardless of any sentence of condemnation by a court of a belligerous captor. It belongs solely to the neutral government to raise the objection to a capture and title, founded on the violation of neutral rights. The adverse belligerent has no right to complain when the prize is duly libeled before a competent court. If any complaint is to be made on the part of the captured, it must be by his government to the neutral government, for a fraudulent, or unworthy, or unnecessary submission to a violation of its territory, and such submission will naturally provoke retaliation.—*Ibid.*

Arming in Neutral Ports.—The government of the United States was warranted, by the law and practice of nations, in the declarations made in 1793, of the rules of neutrality, which were particularly recognized as necessary to be observed by the belligerent powers, in their intercourse with this country. These rules were, that the original arming or equipping of vessels in our ports, by any of the powers at war, for military service, was unlawful; and no such vessel was entitled to an asylum in our ports. The equipment by them of government vessels of war, in matters of which, if done to other vessels, would be applicable equally to commerce or war, was lawful. The equipment by them of vessels fitted for merchandise and war, and applicable to either, was lawful; but if it were of a nature solely applicable to war it was unlawful. And if the armed vessel of one nation should

depart from our jurisdiction, no armed vessel, being within the same, and belonging to an adverse belligerent power, should depart until 24 hours after the former, without being deemed to have violated the law of nations.—*Ibid.*

Prizes in Neutral Ports.—Though a belligerent vessel may not enter within neutral jurisdiction for hostile purposes, she may, consistently with a state of neutrality, until prohibited by the neutral power, bring her prize into a neutral port, and sell it. The neutral power is, however, at liberty to refuse this privilege, provided the refusal be made, as the privilege ought to be granted to both parties, or to neither. The United States, while a neutral power, frequently asserted the right to prohibit, at discretion, the sale within their ports of prizes brought in by the belligerents; and the sale of French prizes was allowed as an indulgence merely, until it interfered with the treaty of England of 1794, in respect to prizes made by privateers.—*Ibid.*

Neutral Property in an Enemy's Vessel.—It is also a principle of the law of nations relative to neutral rights that the effects of neutrals, found on board of enemy's vessels, shall be free; and it is a right as fully and firmly settled as the other, though, like that, it is often changed by positive agreement.

The two distinct propositions, that enemy's goods found on board a neutral ship may lawfully be seized as prize of war, and that the goods of a neutral found on board of an enemy's vessel were to be restored, have been explicitly incorporated into the jurisprudence of the United States, and declared by the Supreme Court to be founded in the law of nations. The rule, as it was observed by the court, rested on the simple and intelligible principle, that war gave a full right to capture the goods of an enemy, but gave no right to capture the goods of a friend.

The neutral flag constituted no protection to enemy's property, and the belligerent flag communicated no hostile character to neutral property. The character of the property depended upon the fact of ownership, and not upon the character of the vehicle in which it is found.—*Ibid.*

Of Restrictions upon Neutral Trade.—The principal restriction which the law of nations imposes on the trade of neutrals, is the prohibition to furnish the belligerent parties with warlike stores, and other articles which are directly auxiliary to warlike purposes. Such goods are denominated contraband of war; but in the attempt to define them, the authorities vary, or are deficient in precision, and the subject has long been a fruitful source of dispute between neutral and belligerent nations.

Contraband of War.—In the time of Grotius, some persons contended for the rigor of war, and others for the freedom of commerce. As neutral nations are willing to seize the opportunity which war presents, of becoming carriers for the belligerent powers, it is natural that they should desire to diminish the list of contraband as much as possible. Grotius distinguishes between things which are useful only in war, as arms and ammunition, and things which serve merely for pleasure, and things which are of a mixed nature, and useful both in peace and war. He agrees with other writers in prohibiting neutrals from carrying articles of the first kind to the enemy, as well as in permitting the second kind to be carried. As to articles of the third class, which are of indiscriminate use in peace and war, as money, provisions, ships and naval stores, he says that they are sometimes lawful articles of neutral commerce, and sometimes not; and the question will depend upon circumstances existing at the time.

Law of Blockades.—A neutral may also forfeit the immunities of his national character by violations of blockade; and among the rights of belligerents, there is none more clear and incontrovertible, or more just and necessary in the application, than that which gives

rise to the law of blockade. Bynkershoek says, it is founded on the principles of natural reason, as well as on the usage of nations; and Grotius considers the carrying of supplies to a besieged town, or a blockaded port, as an offense exceedingly aggravated and injurious. They both agree that a neutral may be dealt with severely; and Vattel says he may be treated as an enemy. The law of blockade is, however, so harsh and severe in its operation, that, in order to apply it, the fact of the actual blockade must be established by clear and unequivocal evidence; and the neutral must have had due previous notice of its existence; and the squadron allotted for the purposes of its execution must be competent to cut off all communication with the interdicted place or port; and the neutral must have been guilty of some act of violation, either by going in, or attempting to enter, or by coming out with a cargo laden after the commencement of the blockade. The failure of either of the points requisite to establish the existence of a legal blockade, amounts to an entire defeasance of the measure, even though the notification of the blockade had issued from the authority of the government itself.

Right of Search at Sea.—In order to enforce the rights of belligerent nations against the delinquencies of neutrals, and to ascertain the real as well as assumed character of all vessels on the high seas, the law of nations arms them with the practical power of visitation and search. The duty of self-preservation gives to belligerent nations this right. It is founded upon necessity, and is strictly and exclusively a war right, and does not rightfully exist in time of peace, unless conceded by treaty. All writers upon the law of nations, and the highest authorities, acknowledge the right in time of war as resting on sound principles of public jurisprudence, and upon the institutes and practice of all great maritime powers. And if, upon making the search, the vessel be found employed in contraband trade, or in carrying enemy's property, or troops, or dispatches, she is liable to be taken and brought in for adjudication before a prize court.

Neutral nations have frequently been disposed to question and resist the exercise of this right. This was particularly the case with the Baltic confederacy, during the American war, and with the convention of the Baltic powers in 1801. The right of search was denied, and the flag of the State was declared to be a substitute for all documentary and other proof, and to exclude all right of search. Those powers armed for the purpose of defending their neutral pretensions; and England did not hesitate to consider it as an attempt to introduce, by force, a new code of maritime law, inconsistent with her belligerent rights, and hostile to her interests, and one which would go to extinguish the right of maritime capture. The attempt was speedily frustrated and abandoned, and the right of search has, since that time, been considered incontrovertible.

This right of search is confined to private merchant vessels, and does not apply to public ships of war. Their immunity from the exercise of any civil or criminal jurisdiction but that of the sovereign power to which they belong, is uniformly asserted, claimed and conceded. A contrary doctrine is not to be found in any jurist or writer on the law of nations, or admitted in any treaty; and every act to the contrary has been promptly met and condemned.

Neutral Documents.—A neutral is bound, not only to submit to search, but to have his vessel duly furnished with the genuine documents requisite to support her neutral character. The most material of these documents are, the register, passport or sea letter, muster-roll, log-book, charter-party, invoice and bill of lading. The want of some of these papers is strong presumptive evidence against the ship's neutrality; yet the want of any one of them is not absolutely conclusive. "*Si aliquid ex solemnibus deficit, cum equi-*

tas poscit subveniendum est." The concealment of papers material for the preservation of the neutral character, justifies a capture and carrying into port for adjudication, though it does not absolutely require a condemnation. It is good ground to refuse cost and damages on restitution, or to refuse further proof to relieve the obscurity of the case, where the cause labored under heavy doubts, and there was *prima facie* ground for condemnation independent of the concealment.

The spoliation of papers is a still more aggravated and inflamed circumstance of suspicion. That fact may exclude further proof, and be sufficient to infer guilt; but it does not in England, as it does by the maritime law of other countries, create an absolute presumption *juris et de jure*; and yet, a case that escapes with such a brand upon it, is saved so as by fire. The Supreme Court of the United States has followed the less rigorous English rule, and held that the spoliation of papers was not, of itself, sufficient ground for condemnation, and that it was a circumstance open for explanation, for it may have arisen from accident, necessity, or superior force.—KENT'S *Comm.*, vol. I. See WHEATON'S *International Law*.

Neutral Trade.—The present position of the United States in regard to neutrals may be learned from the following extract:

"Soon after the commencement of the late war in Europe, this government submitted to the consideration of all maritime nations two principles for the security of neutral commerce; one, that the neutral flag should cover enemy's goods, except articles contraband of war; and the other, that neutral property on board merchant vessels of belligerents should be exempt from condemnation, with the exception of contraband articles. These were not presented as new rules of international law, having been generally claimed by neutrals, though not always admitted by belligerents. One of the parties to the war (Russia), as well as several neutral powers, promptly acceded to these propositions; and the two other principal belligerents, Great Britain and France, having consented to observe them for the present occasion, a favorable opportunity seemed to be presented for obtaining a general recognition of them both in Europe and America.

"But Great Britain and France, in common with most of the States of Europe, while forbearing to reject, did not affirmatively act upon the overtures of the United States.

"While the question was in this position, the representatives of Russia, France, Great Britain, Austria, Prussia, Sardinia, and Turkey, assembled at Paris, took into consideration the subject of maritime rights, and put forth a declaration containing the two principles which this government had submitted nearly two years before to the consideration of maritime powers, and adding thereto the following propositions: 'Privateering is and remains abolished,' and 'Blockades, in order to be binding, must be effective, that is to say, maintained by a force, sufficient really to prevent access to the coast of the enemy;' and to the declaration thus composed of four points, two of which had already been proposed by the United States, this government has been invited to accede by all the powers represented at Paris, except Great Britain and Turkey. To the last of the two additional propositions—that in relation to blockades—there can certainly be no objection. It is merely the definition of what shall constitute the effectual investment of a blockaded place, a definition for which this government has always contended, claiming indemnity for losses where a practical violation of the rule thus defined has been injurious to our commerce. As to the remaining article of the declaration of the conference of Paris, 'that privateering is and remains abolished,' I certainly can not ascribe to the powers represented in the conference of Paris any but liberal and philanthropic views

in the attempt to change the unquestionable rule of maritime law in regard to privateering. Their proposition was doubtless intended to imply approval of the principle that private property upon the ocean, although it might belong to the citizens of a belligerent State, should be exempted from capture; and had that proposition been so framed as to give full effect to the principle, it would have received my ready assent on behalf of the United States. But the measure proposed is inadequate to that purpose. It is true that if adopted, private property upon the ocean would be withdrawn from one mode of plunder, but left exposed, meanwhile, to another mode, which could be used with increased effectiveness. The aggressive capacity of great naval powers would be therefore augmented, while the defensive ability of others would be reduced. Though the surrender of the means of prosecuting hostilities by employing privateers, as proposed by the conference of Paris, is mutual in terms, yet, in practical effect, it would be the relinquishment of a right of little value to one class of States, but of essential importance to another and a far larger class. It ought not to have been anticipated that a measure, so inadequate to the accomplishment of the proposed object, and so unequal in its operation, would receive the assent of all maritime powers. Private property would be still left to the depredations of the public armed cruisers.

"I have expressed a readiness, on the part of this government, to accede to all the principles contained in the declaration of the conference of Paris, provided that relating to the abandonment of privateering can be so amended as to affect the object for which, as is presumed, it was intended, the immunity of private property on the ocean from hostile capture. To effect this object, it is proposed to add to the declaration 'that privateering is and remains abolished,' the following amendment: 'And that the private property of subjects and citizens of a belligerent on the high seas shall be exempt from seizure by the public armed vessels of the other belligerent except it be contraband.' This amendment has been presented not only to the powers which have asked our assent to the declaration to abolish privateering, but to all other maritime States. Thus far it has not been rejected by any, and is favorably entertained by all which have made any communication in reply.

"Several of the governments, regarding with favor the proposition of the United States, have delayed definite action upon it, only for the purpose of consulting with others, parties to the conference of Paris. I have the satisfaction of stating, however, that the Emperor of Russia has entirely and explicitly approved of that modification, and will co-operate in endeavoring to obtain the assent of other powers; and that assurances of a similar purport have been received in relation to the disposition of the Emperor of the French.

"The present aspect of this important subject allows us to cherish the hope that a principle so humane in its character, so just and equal in its operation, so essential to the prosperity of commercial nations, and so consonant to the sentiments of this enlightened period of the world, will command the approbation of all maritime powers, and thus be incorporated into the code of international law."—*Message President United States, Dec., 1856.* See MARITIME LAW, NAVIGATION LAWS.

Nevis, a West India island, belonging to Great Britain, leeward group, in lat. $17^{\circ} 10' N.$, long. $62^{\circ} 40' W.$, separated from the south end of St. Christopher's by a channel two miles across. Area about 20 square miles. Population in 1851, 10,200. Shape circular; the surface rises to a central peak 2,500 feet in elevation. Soil generally fertile, and in 1841, the total produce exported amounted in value to £17,455, sugar standing for £15,527. Total value of imports in 1841, £23,728. The legislature is composed of the ad-

ministrators of the government, a legislative council, and a house of assembly of 15 members. Salary of administrator, £500. The island consists of 5 parishes. Charlestown, the capital, is at its south-west extremity. Public revenue in 1845, £4,566. A letter from the United States' consul, dated December 5, 1855, says: "The legislature of Nevis has passed a law, to go into operation on the 1st of March ensuing, removing all duties on imports, exports, and tonnage duties on vessels, thereby creating a free port. The consequence will be that the commercial intercourse with the United States will be very considerable."

New Bedford, a port of entry in Massachusetts, 55 miles south of Boston, 28 east of Newport, 49 south-east of Providence, 226 east of New York, 434 from Washington; in $41^{\circ} 38' 10'' N.$ lat., and $70^{\circ} 55' 16'' E.$ long. Population in 1830, 7,592; in 1840, 12,087; in 1850, 16,443; in 1851, 18,044; and in 1854, 20,000. There are 33 manufactories of all sorts; the most important of which are, 15 for oil and candles, the product of the whale fishery; one large cotton factory, called the Wamsutta mill, propelled by steam, containing 12,500 spindles, 288 looms, employing 230 hands, and turns out daily 4,800 yards of cotton cloth, which has obtained several medals for its superior quality; one cordage factory, with an invested capital of \$75,000, employing 100 hands, and producing annually 1,000 tons of cordage, celebrated for being of the best quality; a large paper-hanging manufactory which turns out 400,000 rolls of paper annually; also a rivet factory worked by steam, and two iron foundries; four printing offices, issuing two daily, three weekly, and one monthly publication; and 186 mercantile stores. There are two marine railways, one of them capable of taking up large ships. Railroad cars leave three times daily for Boston and Providence, and every afternoon for Fall River and Stonington to connect with steamboats at those places running to New York. The whale fishery is the principal business which is carried on at New Bedford, and has been the means chiefly of building it up to its present importance in population and wealth. As early as 1764, small sloops of 40 to 60 tons burden were fitted out to cruise, during the summer months, off the Capes of Virginia and Hatteras for sperm whales; taking care to return to port before the equinoctial gales commenced; the blubber was brought into port and tried out on shore. Gradually the voyages were extended in larger vessels to the Bay of Mexico, and about the West India Islands, thence to the Azores, and Cape de Verd Islands, and coast of Guinea. In 1791, a ship called the *Rebecca*, was fitted out for a whaling voyage to the Pacific Ocean; this ship was the first American whaler that ever entered that ocean in pursuit of whales; her voyage was successful. From these small beginnings, the whale fishery has steadily increased to its present importance, with the exception of the interruption of the revolutionary war, and of the war of 1812 with Great Britain, until New Bedford has become the greatest whaling port in the world. Her ships now circumnavigate the globe, and explore every ocean and sea from the Arctic to the Antarctic in pursuit of whales. The number of vessels employed in the whale fishery from the United States at this time, 1852, is 620, their tonnage, 193,990, of which there are belonging to the district of New Bedford, 372 vessels, employing upwards of 10,000 seamen. There were entered into the United States, during the year 1851, of sperm oil, 99,591 bbls.; of right whale oil, 328,483 bbls.; of whalebone, 3,916,500 lbs.; amounting in value to \$10,028,089, of which there were imported into the district of New Bedford, of sperm oil, 60,465 bbls.; of right whale oil, 175,460 bbls.; of whalebone, 2,473,500 lbs.; amounting in value to \$5,781,118; of which value, about \$5,000,000 was brought into the port of New Bedford. The average length of the voyages of the right whale ships are 36 months; sperm whale ships

44 months. New Bedford is the great nursery for seamen in the United States. See article OIL.

New Brunswick, a British province, east coast of North America, lat. $45^{\circ} 5'$ to $48^{\circ} 40'$ N., long. $63^{\circ} 50'$ to $68^{\circ} W.$; bounded west by the State of Maine; north-west Lower Canada, from which it is separated by the River Restigouche; north, Bay of Chaleurs; east, Gulf of St. Lawrence and Northumberland Strait, the latter separating it from Prince Edward Island; and south, the Bay of Fundy, and part of Nova Scotia. Its coast-line is about 500 miles in length, interrupted only at the point of junction with Nova Scotia, where an isthmus of not more than 10 miles in breadth connects the two provinces, and separates the waters of Northumberland Strait from those of the Bay of Fundy, which it is proposed to unite by means of a canal. The most remarkable bays and harbors are Bathurst Bay, on the north coast; Miramichi Bay, on the east coast; Passamaquoddy Bay, and St. John harbor, on the south coast. There are, besides these larger indentations, numerous smaller harbors, particularly on the south portion of the east coast. Area, 27,704 square miles.

The population of this province is principally composed of British settlers and their descendants. The remnant, of French extraction, are settled around the Bay of Chaleurs. There is still a few of the aborigines left, consisting of the Micmacs, Melicites, and others, amounting in 1851 to 1,116 persons.

Physical Features, etc.—The general surface of the country presents a series of bold undulations, sometimes rising into mountains, or continuous ridges of high land. The latter are seldom of any considerable height; but their precipitous acclivities, sharp outline, and deep ravines, give them an alpine and picturesque character that finely and strikingly contrasts with the rich valleys and sheltered plains which alternate with the more rugged scenery. The shores of the Gulf of St. Lawrence and Northumberland Strait, however, present different and far less pleasing features. There the land, for about 12 miles inland, is low and sandy, covered with trees of a stunted growth, and skirted with extensive marshes, large deep morasses, and long sand beaches. Along the shores of the Bay of Chaleurs and the Gulf of St. Lawrence, gray sandstone and gray clay-slate predominate, with detached rocks of granite, quartz, and ironstone; on the south coast, limestone, graywacke, clay-slate, with sandstone, interrupted occasionally by gneiss, trap, and granite. Specimens of amethyst, cornelian, jasper, etc., have been picked up in various places. Coal is plentiful, and iron ore abundant; the former is said to extend over 10,000 square miles, or above one third part of the whole area of the province.

New Brunswick is drained by numerous rivers and small streams, the principal of which is the St. John, navigable for vessels of 50 tons to Fredericton. The next river in importance is the Miramichi, which rises near the west limits of the territory, whence it flows north-east, and falls into Miramichi Bay, on the east coast, about lat. $47^{\circ} 5'$ N., long. $64^{\circ} 53'$ W.; its whole course is upward of 110 miles, it is navigable for nearly 40 miles, and admits vessels of 600 or 700 tons. The Restigouche is the next considerable river; it forms the north-west limit of the province, and falls into the head of the Bay of Chaleur, after a course of about 100 miles. There are a number of small lakes in New Brunswick, particularly in the northern part, but none of any considerable size. In the south there are a few somewhat larger, the most important of which are Grand Lake, 20 miles long, by about 5 miles broad; and Washedemoak Lake, about 20 miles long, by 2 miles broad—both lying between St. John and Fredericton.

Manufactures, etc.—There were in the province in 1851, 52 woolen factories, employing 96 persons; 261 grist mills, employing 366 persons; 584 saw mills,

employing 4,302 persons; 125 tanneries, employing 255 persons; 11 foundries, employing 242 persons; 8 breweries; 52 weaving and carding establishments (5,475 hand looms), employing 96 persons; 96 of various manufacturing establishments, employing 953 persons. Coals raised, 2,482 tons; iron smelted, 810; lime burnt, 35,599 casks; grindstones quarried, 58,849; gypsum, 5,465 tons quarried.

Products.—Cloth, 622,287 yards; and 100,975 gallons malt liquor. Value of boots and shoes made, £89,367; leather, £45,165; chairs, cabinet ware, and wood ware, £33,977; candles, £19,860; soap, £18,562; hats, £6,360; iron castings, £20,025.

The principal places are St. John, the metropolis, and Fredericton, the capital. There were in 1854 several railroads in course of construction; 5 banks, aggregate capital, £337,500; a savings' institution, and 4 insurance companies.

Fisheries of New Brunswick.—There were French fishing establishments in that part of Acadia now known as New Brunswick, as early as 1638. The English succeeded to these at the treaty of Utrecht, in 1713; but they do not seem to have formed many others until after the cession of Canada, in 1763.* Among the first, I suppose, was that of Lieutenant Walker, of the royal navy, in the Bay of Chaleurs, which was extensive, controlling the fur and fish trade of that region for several years. There were similar settlements on the River St. John; but from the estimates of Mr. Grant, made in 1764, at the request of the Rev. Dr. Stiles, the whole population of British origin could not have exceeded 1000.

At the peace of 1783, several thousand "Tories," or loyalists, compelled to abandon their native land, settled in New Brunswick, and transferred thither the jurisprudence, the social and political institutions of "the old thirteen;" and, the year following, were allowed to organize a separate colonial government. Like those who went to that part of Acadia still called Nova Scotia, many of the loyalists were gentlemen of education, eminent private virtue, and distinguished consideration. Some obtained offices of honor and emolument; others adopted agricultural pursuits; and another class, fixing their abodes on islands and the shores of the main land, resolved to earn their support on the sea. Of the latter description, several, though compelled to toil and exposure in open fishing boats, had been persons of note and property. But, ruined by the confiscation laws of the Whigs, or by the general disasters of a civil war, they resorted to the hook and line to relieve the pressure of immediate want, indulging the hope of "better times," and more congenial avocations. Few, however, abandoned the employment, and their children, trained to it from early youth, and acquiring fishermen's habits, succeeded to boats, fishing-gear, and smoke-houses, as their only inheritance, and continue it at the present day. I have often met with common boat fishermen of this lineage, whose earnings were hardly sufficient to procure the absolute necessities of life.

The fisheries of New Brunswick are prosecuted with neither skill nor vigor. The *apparent* exports, small as are the statistics, do not indicate their real condition; since it is certain, that of the products of the sea shipped to other countries, a part is first imported from Nova Scotia, and form a proportion of the exports of that colony.† The number of vessels sent to Labrador and other distant fishing grounds is never large, and often almost nominal. The cod-fishery in the Gulf of St. Lawrence and the Bay of Chaleurs is

* The French built two forts on the River St. John prior to the peace of Utrecht (1713), which they repaired in 1754, although the country had been ceded to England quite half a century.

† The imports into St. John from Nova Scotia for three months only (July 10 to October 10) of the year 1852, were 7,861 quintals of dried fish, 860 barrels of mackerel, 2,423 barrels of herring, and other pickled fish.

not as extensive as might be reasonably expected from the long experience of the inhabitants there, and the general safety and productiveness of the harbors and indentations of the coast.

The same remarks need slight qualification when applied to the Bay of Fundy, and its principal branch, the Bay of Passamaquoddy. Cameron's, Doggett's, Drake's, Woodward's, Money, and Whale Coves; Dark Harbor, Long's Eddy, Grand Harbor, and Long, Duck, Nantucket, and Kent's Islands, which are all in the group of islands known as "Grand Menan," afford excellent facilities for catching and curing cod, pollock, and herring, in large quantities. In the waters that surround Campo Bello, Deer, and Indian Islands, as well as in those that wash Bean's, Adams's, Parker's, Minister's, Hardwood, and Fish Islands, and along the coast between L'Etite Passage and Point Lepreau, embracing Mace's and Back Bays, Bliss' Island, Seely's Cove, Crow, Beaver, and Deadman's Harbors, the advantages for fishing are very good. Every place here mentioned is within a few hours' sail of the frontier ports of Maine, and many of them are within cannon-shot distance of the shores of the United States. The fishermen of both countries meet on the same fishing grounds; borrow and lend "bait;" ask after each other's "woman"* at home; narrate the wonderful cures of the last-discovered remedy for the "rheumatis;" complain of the "scarcity" of fish, and the low price of "ile;" discourse about "flat-hooped flour;" and generally conduct toward one another as friends and brethren, owing allegiance to one government. Indeed, the observation of quite 25 years authorizes me to say that the colonists always agree far better with the Americans than with each other. Our countrymen are not often considered interlopers when they leave the fishing grounds nearest home and visit those of Grand Menan; but the fishermen of Campo Bello, and the other islands on the British side of the Passamaquoddy, are sometimes roughly accosted and "twitted" when they venture to take the same liberty. Frequent attempts have been made to disturb the friendly relations which have generally existed between the people of the two flags, but without success. The efforts of officious individuals, and of functionaries of the colonial government, have been alike disregarded. The captains of the British ships-of-war on the station, gentlemen in their feelings, have steadily refused to stoop to wage a petty warfare against the American boats that cross the imaginary boundary line in the waters of the Passamaquoddy, though, of course, they have *always* obeyed their instructions. Yet, in the spirit of Nelson, who looked at the signal he meant to disobey with his blind eye, they have never been able to see a "Yankee," or to distinguish one from a subject of her majesty. Some of them—as I remember the stories of by-gone years—admitting the necessity of driving off the aggressors, have asked, "How are we to know them—are they marked?" Others, sending their barges into the fleet of boats, have directed that "all who say they are Americans must be told to go to their own side of the line;" but, strangely enough, the unbroken silence of the fishermen to whom the question was propounded afforded proof that all were "Bluenoses." Still others, satisfying themselves, by peering through glasses from their quarter-deck, that *all* the boats in sight must belong to the islands in New Brunswick, have thought the sending of barges to inquire a needless ceremony. One, in 1840—the captain of the *Ringdove*—in his official report, recommended that "every British boat should have a license; otherwise," said he, "it is impossible to discriminate them from Americans."

Those who seek to put an end to this state of things, whatever their motives, do not take into the account

that the instant they shall accomplish their object, border strifes will follow of necessity. Before renewing their efforts, they may be kindly asked to consider that harmony and good-fellowship between the inhabitants of frontier settlements are indispensable, and far better securities against the marauder's torch and bludgeon than armed ships or bodies of troops. The produce of the boat-fishery of the Bay of Fundy, and of the Passamaquoddy, is not only small in value, but generally inferior in quality. An increase of this fishery, under present circumstances, is not desirable. The fishermen dress and cure the cod, pollock, hake, and haddock—the kinds usually dried—in a slovenly manner.

It is stated in an official document that in 1850, at the different fishing-stations mentioned as within these bays, there were employed 62 vessels of 1,268 tons, 844 open boats, 55 weirs, and 1,337 men, in catching and curing the several kinds of fish just referred to; and that the value of the products of the various branches of the fishery were £33,080 currency, or \$132,320. These facts show that the fishermen received a miserable pittance for their toil; since, without allowing for the use and depreciation of the capital invested in the vessels, boats, weirs, nets, and other fishing-gear, they earned for the year less than \$100 each. We may lament that men who pursue their avocation both day and night, 'mid rains and gales, are so poorly rewarded. We may lament, too, that the people of Grand Menan, falling short of those of Campo Bello, West Isles, and the parishes on the coast of the main land, earn even less than the average. But, what then? The fault is their own; entirely so. They may, if they will, produce as sweet and as well-cured pollock and cod as do their brethren of Barrington, and as good colored and flavored smoked herring as do those of Digby, and obtain prices to correspond with the quality.

The general poverty among them is not to be attributed entirely or principally, as they aver, to the occasional loss of boats and nets, nor to glutted markets and bad seasons, nor to the interlopers who visit their fishing grounds, but to their own want of industry, thrift, cleanliness, and honesty. The few "who work it right," acquire property, and enjoy the entire confidence of the dealers, command credit for supplies, and high prices for their commodities when offered for sale.

It remains to speak of the fisheries of the Bay of Chaleurs, and of the Gulf of St. Lawrence. The county of Restigouche borders on Canada, and the counties of Gloucester, Northumberland, and Kent, are favorably situated for adventures in these waters. The fishing grounds are safe, and generally close to the shores; and those near Caraquet, in Gloucester, are much frequented by boats from Gaspé, and owned by residents of Canada. Since 1835, the catch of both cod and herring by the fishermen of Restigouche and Northumberland has fallen off more than half, and in Kent has nearly become extinct. But the inhabitants of the port of Caraquet, availing themselves of the advantages of their position, have actually produced a large portion of the dried cod exported from the colony for some years. These four counties are more remote from the capital of New Brunswick, and from the markets of the United States, than the county of Charlotte, which embraces Grand Menan, and the other islands in the Bay of Fundy (where the fish are so badly cured), and the attention of the people is divided between several branches of industry; but fishing, as an occasional and irregular employment merely, has commonly proved a source of profit, or at least has afforded a fair reward for the labor and capital devoted to it. The fish shipped at Caraquet are in much better repute than those caught in the Bay of Fundy, and the remark is true of the produce of the Bay of Chaleurs and St. Lawrence fisheries generally. It may be presumed that *there* the herring does not

* They thus speak of their wives.

"become rotten before salting;" that, when sold as the "gibbed" article, it is not packed without taking out the entrails; and that the cod is washed after being split, and not salted and put in "kinch" in all its blood and dirt.—*SABINE'S American Fisheries.*

The following statement exhibits the value of imports and exports to and from the United States and New Brunswick during the years 1849 and 1850:

	1849.	1850.
Exports to New Brunswick....	\$1,822,810	\$1,810,740
Imports from ".....	257,910	387,000

The following abstract of the trade between the United States and the port of St. John, New Brunswick, shows the number of ships and tonnage entered inward, and the value of imports at that port during the year ending 31st December, 1851: Vessels inward: 605 vessels, of an aggregate tonnage of 166,952 tons; value of imports, \$1,458,205. Vessels outward: 359 vessels, of an aggregate tonnage of 64,344 tons; value of exports, \$312,895.

The United States export to New Brunswick, principally, books and stationery, Indian corn, flour, wheat, lumber, salted provisions, rice, coal, tobacco, timber, and various kinds of manufactured goods, and merchandise; and receive, in return, timber of different kinds (except pitch-pine, oak, locust, hickory, and black walnut), lumber, staves, laths, shingles, spars, and fish. Coal and timber being classed among the staples of both countries, an examination has been instituted with a view to ascertain the probable effect of the Reciprocity Treaty on the trade in these articles between the United States and New Brunswick. To meet this inquiry, it is necessary to know whether the coals and timber of New Brunswick and the United States are similar in character and kind, or whether they differ in both, and in the uses to which they are applied; each having their own peculiar advantages for certain purposes.

Dr. Jackson, an American geologist of ability, in a sketch "of the early history and of the present state of our knowledge of the geology, etc., of Nova Scotia and New Brunswick," referring to the mineral productions of these provinces, says: "The coals of Nova Scotia are of various kinds, and are wholly different from those of the United States; at least, they differ from all the coals which are found on the eastern side of the Appalachian Mountains, so that they do not enter into competition with the coals obtained from mines in the United States, which supply our coast." In a subsequent part of this essay Dr. Jackson remarks, in substance, that recent explorations in New Brunswick have brought to light a beautiful and before unknown variety of highly bituminous coal, containing 60 per cent. of gas-making bitumen and 40 per cent. of coke. This coal is a new variety, particularly adapted to the uses of the gas-house; and it is represented by Dr. Jackson as the very material wanted by gas-manufacturers to enrich the products of our semi-bituminous coals of Maryland and Virginia. In the formation of gas, this New Brunswick production can not be used alone, but is mixed with other coals, in the proportion of from one fifth to one third; and thus gives the best material that can be obtained. It also gives greater value to the coke of our more ash-bearing coals. If these facts are to be relied upon (and they are supported by high authority), it follows that the importation of the New Brunswick coal into the United States, so far from interfering with the sale of our own coals, would contribute, in a great measure, to make available, in the manufacture of gas, much of those which would otherwise be unsuitable for that purpose. With these distinctive characters and different applications, the coals of New Brunswick and Nova Scotia will always be required, whatever may be the supply of our own mines of Pennsylvania, Maryland, and Virginia. Indeed, the mine near Richmond, Virginia, is the only one in the United States that furnishes bituminous coal

that will fully serve in the place of the coals of Nova Scotia.

From the imports and exports of timber between the United States and New Brunswick, it will be seen that New Brunswick imports from the United States large quantities of pitch-pine, oak, locust, hickory, and black walnut, none of which are found in that province; while the United States receives, in return, boards, scantling, deals, various kinds of lumber, and fish. The interchange of these products must be greatly increased under a system which relieves them from all import duties.—*U. S. Com. Rel.*

Newcastle. The following information is from the United States' consul at Newcastle in answer to a circular issued by the State Department: "In this port there are no privileges that British or any other vessels have which American vessels have not to the same extent; but there are restrictions and extra charges at this port on the vessels of some other nations that have not treaties of reciprocity with England, viz., France, Two Sicilies, and Portugal. French vessels, taking cargoes to, or bringing them from, any place but France proper, are subject to double the ordinary light-house dues; also, to double harbor lights, double Ramsgate dues; and in case the vessel loads coals or grindstones, instead of paying 4 cents, or 2d., per chaldron town dues, as the vessels of nations in reciprocity, 16 cents, or 8d., per chaldron, is charged. When the vessel goes to any place but France proper, such vessels also pay 12 cents, or 6d., per foot extra pilotage. Vessels belonging to the Two Sicilies are subject to the same extra charges. Vessels belonging to Portugal have the additional privilege of taking cargoes to or from their own colonies on the same terms as to Portugal proper, but to or from any other country they are subject to the above extra charges. There are, also, other nations, such as some of the South American States, whose vessels are subject to these extra charges, but such vessels never visit this port. These extra local dues are, nevertheless, payable by all foreign vessels coming to this port, but the British government satisfy these claims on the vessels of nations in reciprocity.

"The port charges on vessels of the United States are the same as on British vessels. Annexed are particulars of the charges on a vessel of 400 tons register, carrying 200 chaldrons, or 530 tons, of coals and 60 tons of other goods. Vessels belonging to the United States (by a law passed this (1854) session of Parliament) are allowed to carry goods of any kind coastwise without any restriction, and with every privilege that British vessels enjoy.

LIST OF CLEARING CHARGES AT THE PORT OF NEWCASTLE, CHARGED ON AN AMERICAN VESSEL OF FOUR HUNDRED TONS REGISTER, CARRYING TWO HUNDRED CHALDRONS OF COALS AND SIXTY TONS OF OTHER GOODS.

"If the vessel bring ballast, there is an additional charge on it of 1s. 6d., or about 36 cents, per ton on the ballast. Sea pilotage, in winter, 1s. 6d.; and in summer, 1s. 3d. per foot. Towage, according to distance, from 5s. to £3.

"Insurances are mostly effected in the States; the rate here runs from 2½ to 5 per cent., according to season and class of vessel. Freights from \$4 84, or 20s., to \$7 74, or 32s., per ton, according to circum-

stances. Commission for purchasing is usually 2½ per cent. Sales are made either by direct correspondence or through agents resident here. Terms vary, with the articles, from 2 to 4 months. Bills, and a various discount for cash, are the ordinary terms. There is no export duty payable on goods to the United States. There are no internal taxes levied on any of the commodities mentioned, either in a crude, partially manufactured, or wholly complete state."

Newfoundland, Colony of, is in lat. 46° 40' and 51° 39' N., and long. 52° 44' and 59° 31' W. Area, 35,913 square miles. Extreme length, about 420 miles, and extreme breadth, about 300 miles.

Newfoundland is an island lying on the north-east side of the Gulf of St. Lawrence, and is bounded on the whole east shore by the Atlantic Ocean, on the north-west and north by the Strait of Belleisle, which separates it from Labrador, on the west by the Gulf of St. Lawrence, and on the south-west it approaches at Cape Ray toward Cape Breton, so as to form the main entrance from the Atlantic into the St. Lawrence. Capital, St. John's. The island is of a somewhat triangular form, but without any approach to regularity, each of its sides being broken into numerous bays, harbors, creeks, and estuaries. Its perimeter is not less than 1000 miles. From the sea it has a wild and sterile appearance, and its general character is that of a rugged, and, for the most part, a barren country. Hills and valleys continually succeed each other, the former never rising into mountains, and the latter rarely expanding into plains. Of various character, the hills sometimes form long, flat-topped ridges, and are occasionally rounded and isolated, with sharp peaks and craggy precipices. The valleys vary also from gently sloping depressions to rugged and abrupt ravines. The sea-cliffs are bold and lofty, with deep water to their bases; and the rough character of the country is increased by the existence of vast boulders scattered over it. This uneven surface is naturally distinguished into woods, marshes, and barrens. The "woods" are spread over the whole country wherever there is any water-course, and are even found crowning the summits, and near the sea-coast are especially luxuriant. The trees consist principally of pine, spruce, fir, larch (or hackmatack), and birch; in some districts the mountain ash, the alder, the aspen, and a few others are found. Most of the wood is of small and stunted growth, although the character of the trees is greatly varied in this respect according to soil and situation, and in small groups wood of fair growth and length may be found. The open tracts are generally called "marshes." These are not necessarily low, or even level lands, but are frequently at a considerable height above the sea, and have often an undulating surface. They are open tracts, covered with moss, sometimes to the depth of several feet. This thick coating of moss is precisely like a great sponge spread over the country. At the melting of the snow, it becomes thoroughly saturated. Numerous small holes and pools, and in the lower parts small sluggish brooks or gullies are met with. But in most cases the surface is sufficiently eligible for drainage, and when the moss is stripped off, dry ground or bare rock is generally found beneath. The "barrens" occupy the summits of the hills and ridges, and other elevated and exposed tracts. They are covered with a thin and scrubby vegetation, consisting of berry-bearing plants, and dwarf bushes of various kinds. Bare patches of gravel and boulders, and crumbling fragments of rock are frequently met with upon the barrens, which are generally altogether destitute of vegetable soil. These different tracts are none of them of great extent; woods, marshes, and barrens frequently alternating.

Not the least remarkable features of the island are its lakes and ponds. These are found in every direction, and in almost every situation, not only in the

valleys, but on the highlands, and even in the hollows of the summits, and on the very tops of the hills. They vary in size from pools of 50 yards in diameter to lakes 30 miles in length, and from ¼ to 5 miles wide. The number exceeding 2 miles in extent amount to several hundreds, while those of smaller size are absolutely countless.

But with all this lake surface, there are few large water-courses; yet this absence of any thing which can be called a navigable river is readily explained. The character of the natural surface, indeed, is such that it absorbs every new accession of moisture from rain and melted snow, and only parts with it again by evaporation or a slow drainage into the ponds, the overflow of which is the only supply the brooks have. Thus there is never formed a current sufficiently powerful to dig out a deep channel, or to breach opposing barriers. The area covered by fresh water has been estimated at one third the whole island, and this large proportion will not probably be found exaggerated.

The coast of Labrador is also included in the government of Newfoundland, to which it was annexed in 1808. It has a sea-coast of about 100 miles, and is frequented during the summer season by more than 20,000 fishermen. This vast country, inhospitable in climate and uninviting, is inhabited by Esquimaux and Moravian missionaries, in all numbering some 8000 or 10,000 souls. Situate in a severe and gloomy climate, and producing nothing that can support human life, this is one of the most barren and desolate of countries. But, as if in compensation for these disadvantages, the sea in its vicinity teems with fish, and thus thousands of hardy adventurers are drawn to its rugged shores, and their industry and enterprise amply rewarded. The sea in this locality indeed forms the most valuable fishery in the world. In no part the mainland of Labrador exceeds the height of 500 feet above the sea, and is often much lower, as are all the islands, except Great and Little Mecatina. Both are of granite rock, and almost bare of trees; and there are many ponds of dark bog water, frequented by water-fowl and flocks of Labrador curlew. The coasts are beset with islands and rocks, sometimes so intricate as to forbid navigation. There are, however, several harbors fit for large vessels, and which may be safely entered. The Strait of Belleisle, which separates the two parts of the government, is about 50 miles long and 12 wide. It is deep, but its passage is not considered a safe one, owing to its currents. There are no harbors on that part of the Newfoundland coast which faces this strait, and few on the opposite coast. During the winter months the resident population of European descent scarcely numbers 800 souls, and many of these have intermarried with the Esquimaux. The few widely scattered families reside at the establishments for sea and salmon fishing and for fur-trading. Seals and salmon are very plentiful, and the latter are of a large and superior description. The furs of Labrador are very valuable, and consist of fox, otter, sable, lynx, bear, wolf, deer, ermine, hare, etc. The Canadian partridge and the ptarmigan are also plentiful. The "egging" business employs a large number of small schooners. The eggs obtained are chiefly those of the murr, but the eggs of puffins, gannets, gulls, eider ducks, and cormorants, are also collected. Halifax is the principal market for these, although no small quantity is disposed of at Boston and other United States' ports. Feathers are also extensively collected on the coasts and islands.

The average size of Newfoundland vessels is about 130 tons. The chief coasting trade consists in carrying provisions and supplies for the fishery, and bringing back the proceeds of the voyage.

Newfoundland proper is divided into nine districts, the population of which, in 1845, the last census year, was as follows:

The annexed is an account of the vessels and tonnage, both British and foreign, entered inward, and cleared outward, of the colony of Newfoundland, in the year ending 5th January, 1852:

Countries.	ENTERED.				CLEARED.

Making an aggregate of 1265 vessels, and 142,467 tons (manned by 8465 men), entered, and a total of 1106 vessels, and 128,890 tons (with 7741 men), cleared. From this exhibit it will be seen that the arrivals from the United States greatly exceed the departures for this country, thereby showing the balance of trade to be strongly against this colony.

The entrances and clearances for the past four years have been as follows:

Years.	Entered.		Cleared.	
	Vessels.	Tons.	Vessels.	Tons.
1849	1,156	132,383	1,074	126,643

The Labrador coast, as before observed, is the resort of a large number of fishermen. Since the treaty of Paris, this fishery has increased more than sixfold. No accurate account of the products can be ascertained, but the following is considered to be an approximation. The salmon fisheries average annually about 30,000 tierces. The herring fisheries are also very large, and the seal fisheries are equal in value to those of Newfoundland. The imports of Labrador have been estimated by the authorities of Newfoundland at \$600,000 per annum, and the following is an approximation to the value of the exports:

American vessels.....	\$430,000
Nova Scotia vessels.....	430,000
Canada vessels.....	144,000
Vessels owned or chartered by English and Jersey houses having establishments on the coast.....	430,000
Vessels owned or chartered by the people of Newfoundland.....	1,200,000

Total.....\$2,784,000

The total exports, however, are by some persons estimated at \$4,000,000.

[Authorities: Official Abstract of Census, 1845; Return showing the Value of Articles, etc., imported, and the Newfoundland Almanac for 1853, furnished by Hon. James Crowdy, Colonial Secretary; MARTIN'S

British Colonies (London edit.); *ANDREWS'S Report on Colonial and Lake Commerce* (U. S. Sen. Doc. 112, part viii., p. 578); *Report of the Committee* (Canada) to prepare a *Statement of the Population, Income, Expenditure, and Debt of the Provinces of British North America* (June, 1853), etc., etc.]

Trade with the United States.—The great staple of this colony is derived from its extensive fisheries. An elaborate and interesting account of these may be found in Mr. Andrews's Report on Canada, etc., already referred to.

The trade of Newfoundland with other countries than the United States, particularly with Spain, Portugal, Italy, and the Brazils, is much more extensive, in proportion to its commercial capabilities, than is that of any other North American colony. The heavy balance against that island, in its trade with the United States, may suggest a reason why it seeks a European market for so large a portion of its products. The United States export to Newfoundland, beef, pork, pitch and tar, corn-meal, flour, rice, tobacco, and general merchandise. It may be seen from the following table that flour and pork amount to fully three fourths of the total exports from this country to Newfoundland.

STAPLE ARTICLES OF PRODUCE, AND THEIR QUANTITIES, EXPORTED FROM THE PORT OF ST. JOHN'S, NEWFOUNDLAND, TO THE UNITED STATES OF AMERICA, IN THE YEARS 1853, 1854, AND 1855.

"Article 3. It is agreed that the articles enumerated in the schedule hereunto annexed [the preceding list], being the growth and produce of the aforesaid British colonies, or of the United States, shall be admitted into each country, respectively, free of duty." The colonies referred to in the foregoing articles are, Canada, New Brunswick, Nova Scotia, and Prince Edward's Island. With respect to Newfoundland, article 6 provides as follows: "And it is hereby further agreed, that the provisions and stipulations of the foregoing articles shall extend to the island of Newfoundland, so far as they are applicable to that colony. But, if the imperial Parliament, the provincial Parliament of Newfoundland, or the United States, shall not embrace in their laws, enacted for carrying this treaty into effect, the colony of Newfoundland, then this article shall be of no effect; but the omission to make provision by law to give it effect, by either of the legislative bodies aforesaid, shall not in any way impair the remaining articles of this treaty." This treaty is limited to ten years, with the usual notice of 12 months by either of the high contracting parties who may wish to terminate the same. Date of exchange of ratifications of the treaty above referred to, September 9, 1854. Date of President's proclamation of

the same, September 11, 1854. Date of its acceptance by Canada, 23d September, 1854; by New Brunswick, 11th November, 1854; by Nova Scotia, December 15, 1854; by Prince Edward's Island, 11th October, 1854; and by Newfoundland, 14th November, 1855.—*U. S. Com. Digest*, 1856: See HUNT'S *Mer. Mag.*, x., 380; FRASER, xxxii., 740; *Elec. Rev.*, xliii., 316.

New Granada is the most important of the three republics into which the South American republic of Colombia resolved itself at the dissolution of that confederation in 1831. Till 1810 it was a vice-royalty under the Spanish crown, but subsequently a part of the republic of Colombia, the middle and western portions of which it now embraces. New Granada is bounded on the north by the Caribbean Sea, on the east by the republic of Venezuela, on the south-east by Brazilian Guiana, on the south by the republic of Ecuador, and on the west by the Pacific Ocean. It lies mostly between the equator and 12° N. lat., and between 70° and 83° W. long. Area about 480,000 square miles.

The *llanos* or plains of the Orinoco extend over the entire tract, stretching away to the western banks of the Orinoco and to the Cassiquiare, between the Rio Negro on the south, and the Rio Apure on the north. As far south as the Vichada, the northern part is a complete level, averaging only 300 feet above sea-level near the mountains, whence it gradually, but almost imperceptibly, declines toward the Orinoco. With the exception of a few palms that occur at great intervals all over the plain, and some low bushy trees along the rivers, this district is quite destitute of trees. During the rainy season, which is from April till November, rain falls in torrents, accompanied with fearful thunder-storms, which usually occur between two and four o'clock in the afternoon; but the contrast is very striking in December, January and February, when a cloud never crosses the sky. This immense plain is not at all fit for cultivation; but innumerable herds of cattle and horses find abundant pasture on it during the rainy season, though they suffer much during the dry months, from November till April. The wet season is, on an average, 8° Fahr. hotter than the dry, and the mean annual temperature is 80° Fahr.

The principal rivers of New Granada are the Magdalena and Cauca, which run their whole course within the territory of the republic, taking their rise in the Andes near the southern frontier, and after flowing nearly the entire length of the country from south to north, unite in one channel, and discharge their combined waters through a delta, by three channels, into the Caribbean Sea, about W. long. 75°. Besides these two principal streams, a large number of the tributaries of the Orinoco, having their sources in the different ranges of the Andes, drain the *llanos* of the east. Of these, the principal are the Apure, Meta, Vichada, Guaviare, Rio Negro and Japura, on the mutual boundary with Ecuador. The lakes of New Granada are inconsiderable; the most celebrated is the Guatavita, not far from the city of Bogotá, into which, it is affirmed, large treasures were thrown by the natives during the Spanish invasion and conquests.

The mineral riches of New Granada are considerable, and mostly occur in the western declivity of the three chains of the Andes. They consist of salt-rock, lead, iron, copper, mercury, platinum, silver, and gold. Along all the central and western declivity of the Andes gold is found, and is obtained by washing the sand of the rivers, as well as that on the sides and foot of some hills. It is found on the plateaux of Cucuta and Girona in the eastern Andes, where silver also is obtained in considerable quantity. There are also some very rich mines in the mountain region between the Rios Cauca and Magdalena, north of N. lat. 5½°. Platinum is found in the western declivity of the western Andes, and mercury in the valley of Santa Rosa, near Antioquia, and near the Pass of

Quindiu in the central Andes. Copper is found in the eastern Andes, near Pamplona, and north of Tunja. Iron and coal occur in the mountains bordering on the table-lands of Bogotá, and lead in various parts of the eastern Andes. In some mountains north-east of Bogotá large masses of rock-salt are found, and it is worked by the government. Large quantities of salt are furnished also by salt-springs in the same mountains.

From the great diversity of surface, soil, and climate of New Granada, the natural productions are extremely varied, embracing almost every variety found in the temperate as well as in the tropical zone. The chief objects of culture over the table-lands of Bogotá, and the district north of it, along the western slopes of the eastern range, are the cereals as in Europe, the aracacha-root, and potatoes; but in the river-valleys, and on the coast-plains, maize is the chief grain cultivated, with rice, sweet potatoes, and plantains. As articles of commerce, are cultivated coffee, cotton, cocoa, tobacco, some sugar, and indigo. The forests abound with numerous kinds of useful timber trees; but those converted into articles of export are the log-wood, Brazil, Nicaragua, and fustic trees, which grow most abundantly in the forests of the Santa Marta chain. The balsam of Tolu, so named from a village near Cartagena, is collected largely on the banks of the Rio Sinu, and ipecacuanha on those of the Rio Magdalena; cinchona, or Peruvian bark, is obtained in large quantities in the region of the Sierra de Santa Marta, as well as in several other places; cochineal of the finest quality is procured from the banks of the Sogamozo. Previous to the discovery of this country by Europeans, horses and cattle were unknown in these regions; but now *tasajo*, or jerked beef, and hides, as articles of commerce, are furnished by the immense herds of cattle which the *llanos* support; and mules, horses, and cattle are exported to the West Indies.

The population of New Granada are descendants of the Spaniards who have settled there during the three last centuries, and some of the native tribes intermixed with a few negroes. Very different degrees of civilization are found among the native tribes. Before the invasion of the Spaniards, those of the table-lands along the eastern Andes had organized a political system, and made some progress in the simpler arts of civilization. These, with the Indians in the valley of the upper Magdalena, are still the best husbandmen in the republic. Between the Pacific and the western Andes, nearly all the population are descendants of the aboriginal native tribes, whose progress in the arts of civilized life is very small, and almost exclusively owing to the few Spanish priests scattered among them as missionaries. None but the descendants of Europeans dwell in the treeless *llanos*; and their occupation is the care of the herds of mules, horses, and cattle. Wandering Indians, still in a very barbarous state, occupy the southern wooded portion of the *llanos*. The numbers of the respective races occupying New Granada have been estimated by Hubner as follows:—

White Caucasians.....	450,000
Native civilized Americans.....	801,000
Negroes.....	80,000
Mestis (descendants of Spaniards and natives)	999,000
Mulattoes.....	283,000
Samoyes.....	120,000
Zambos (in Magdalena).....	100,000
Quadrones.....	30,000

Total estimated population in 1853, 2,263,000

Agriculture holds the first place in the industry of New Granada. Rice, cotton, tobacco, cocoa, sugar, and tropical fruits, are among the productions of the coast region; while the elevated plains yield maize, wheat, and all the products of a temperate zone. The cultivation of the soil, however, is carried on very carelessly; and reclaimed land bears but a small proportion to the whole. On the *llanos* toward the Orinoco, almost the sole occupation of the people is the

rearing of cattle and horses. Agriculture is chiefly in the hands of the converted Indians, who manifest a very decided predilection for these labors of peace. Manufacturing industry is of so little importance that it can hardly be said to exist in the republic. It is limited to home-made coarse woollens and cottons, adapted for the use of the lower classes only. At Bogotá, the capital, and the other principal towns, indeed, straw hats, carpets, and some other articles are made, but in no case does the native industry become commensurate with the demands of the country, so that nearly all manufactured goods in use are imported. Mining is carried on, but only to a very inconsiderable degree. There is a silver mine at Santa Ana, in Bogotá, the only one now worked; and gold is collected in a few localities. Emeralds, diamonds, and pearls, are also obtained. The salt mines of Zipaquirá are, however, extensively worked. With the exception of this last, the mining business of the country is left entirely to the poor and ignorant.

The principal ports of New Granada are—on the Caribbean Sea, Santa Marta, Cartagena, Chagres, Río de la Hacha, and Portobello; on the Pacific, Panamá and Buenaventura. Steamers now navigate the Magdalena; and the only railway in the country is that from Aspinwall to Panamá.

Christopher Columbus discovered terra firma in 1498, and, during his fourth voyage, on the 2d of November, 1502, found Chagres and the Bay of Limones, called also Navy Bay. Different governments have been established throughout the Granadian territory, while Spanish colonies; a vice-royalty was at length formed in 1732, of what are now the republics of New Granada and Ecuador. In 1810, New Granada separated herself from the Spanish monarchy, and maintained a constant war until 1824, when the Spanish army was conquered by the republican, of which two thirds consisted of Colombians. Bolívar, the most distinguished leader of the Spanish-American revolution, was the first proposer of the union of Venezuela and New Granada, in 1818; and when the Congress of Angostura met, early in 1819, the fundamental law was enacted which established Colombia, on the 17th of December of that year. Venezuela separated herself in November, 1829, and Ecuador in May, 1830; and the central part of Colombia instituted itself the republic of New Granada on the 21st of November, 1831. In 1832, the constitution of the State was sanctioned, under the form of a democratic republican government, by dividing the supreme power into the executive, legislative, and judicial, under a central regimen, but giving to the provinces a municipal corporation, that each section might legislate in its local affairs. The republic was divided into provinces, these into cantons, and the cantons into parochial districts. The State recognized no national religion; but has declared that it will pay for the Catholic worship, and protect Granadians in its exercise. The law of Colombia, which attributed to itself the law of patronage exercised by Spain, has continued in vigor to the present time. The republic was first divided into 18 provinces; and they have since been increased to 35. The constitution of 1832 was reformed in 1843, without any variation in the form of government.

Commercial relations between the United States and New Granada are regulated by treaty of December 12, 1846, proclaimed June 12, 1848. The following summary presents the principal commercial features of this treaty:

There shall be a perfect, firm, and inviolable peace and friendship between the two republics. No favors to be granted by either party to other nations, which shall not become common to the other. Mutual benefits in trade and residence to be equally enjoyed. The coasting trade reserved by each country to its own flag. Equalization of duties granted by each country on vessels and their cargoes. The privileges respecting

drawbacks equalized to the flag of each in the ports of either. Importations and exportations of articles, the produce or manufacture of either country, into or from the other, equalized as to duties with similar importations and exportations of any other foreign country. All prohibitions as to articles of import or export to be equal in each country as respects the flag of the other; the three preceding stipulations to apply, whether the vessels proceed from their own ports or from foreign ports, respectively. The citizens of either country to be free to manage their own business, as well with respect to shipping and its incidents, as to purchases, sales, etc., in the country of the other; and this privilege to be enjoyed personally or by agents—they being in all these cases treated as citizens or subjects of the most favored nation. In case of embargoes, detention of vessels, etc., for public or private uses, full indemnity to be allowed. The vessels of either party seeking refuge in the ports of the other to be protected. Vessels captured by pirates to be delivered up to the owners. Assistance to be given in cases of shipwreck, etc., in the ports of each to the vessels of the other, in the same manner as to the national flag. Citizens of either country authorized to dispose of their personal goods and real estate within the jurisdiction of the other, by sale, donation, testament, or otherwise; and their representatives, being citizens of the other country, to succeed to their said personal goods or real estate, whether by testament or *ab intestato*, and to take possession thereof, either by themselves or others acting for them, and to dispose of the same at their will, paying only such dues as the inhabitants of the country are subject to in like cases. Protection to persons and property formally guaranteed, whether such persons are transient or dwellers in the territories under the jurisdiction of either party, respectively; and access to the legal tribunals of each country, free and unrestricted, granted to the citizens of the other, on the same terms as to the native or other citizens of such country. Liberty of conscience and the free and unrestricted rites of burial guaranteed. Both parties at liberty to trade with those at enmity with the other. Free ships to make free goods, contraband of war excepted. Enemy's property, to be protected by a neutral flag, must be shipped within two months after declaration of war. Articles contraband of war specified. Blockade defined to be the besieging or blockading of those places only which are actually attacked by a belligerent force capable of preventing the entry of the neutral. All contraband articles liable to confiscation. In case of blockade, vessels to be turned away, but not detained. Vessels entering before blockade may quit unmolested. During a visit at sea, armed vessels to remain out of cannon-shot. In case of war, sea-letters, certificates of cargo, etc., to be furnished, showing to whom the property belongs. In case of war between the two nations, merchants allowed time (6 months to those residing in ports, and 12 months to those residing in the interior) to arrange their business, transport their effects, etc. Citizens of other occupations, who may be established in the territories of the United States or of New Granada, to be respected and maintained in the full enjoyment of their personal liberty and property, this protection being dependent on their conduct. No confiscation of debts, etc., in the event of war. Citizens of the United States, their vessels and merchandise, placed on the same footing as those of New Granada in the ports of Panamá. Right of transit across the Isthmus of Panamá guaranteed to citizens of the United States, and no other or higher tolls to be exacted from them than from citizens of New Granada. The United States guarantees to New Granada the perfect neutrality of the Isthmus. Citizens to be held personally responsible for infringing any articles of the treaty; but reprisals not to be authorized, nor war declared, until justice has been demanded and refused.

An additional article provides that the two republics will hold and admit as national ships, of one or the other, all those that shall be provided by their respective governments with a patent issued according to its laws. The treaty to continue in force twenty years from the date of its ratification, and after that period the usual twelve months' notice required. The navigation and tariff regulations of New Granada are marked by a spirit of liberality, though the foreign commerce of the republic has not, as yet, attained any considerable importance. The commerce of the United States, however, with that republic, is thought to labor under some disadvantages, as appears from the following extract from a late consular return: "Our commerce, by treaty, is put on the footing of the most favored nations. But this is nominal only; for, in the list of dutiable articles, those supplied by the United States are taxed at a higher rate than such as come from England, France, and Germany. I can not now give you many instances; but my recollection is, that flour, bacon, and provisions generally, as well as common hats, boots, and shoes, may be enumerated. The articles mainly produced by the United States being taxed at a higher rate than articles produced by England, etc., etc., creating a practical discrimination against us, necessarily operates as a double injury in the exchange for the products of this country. * * * These matters should be corrected, and there should be a stipulation inserted in the treaty (should a new treaty be entered into) prohibiting the provinces from adding any tax, direct or indirect, except, perhaps, to enforce *bona fide* inspection."

The principal commercial ports of New Granada are Santa Martha, Cartagena, and Panama; the aggregate trade of which ports, for the year 1852, is given in the following statement:

COMMERCE OF NEW GRANADA, 1852.

Principal ports.	Entered.		Cleared.	
	Ships.	Tons.	Ships.	Tons.
Cartagena.....	114	14,871	109	13,734
St. Martha.....	59	4,157	48	4,127
Panama.....	312	143,899	297	133,836
Total.....	485	162,427	454	151,697

	Value entered.	Value cleared.
Cartagena....	881,946 livr. sterl.	99,207 livr. sterl.
St. Martha....	84,734 "	15,993 "
Panama.....	302,368,000 francs.	2,476,009 "

The subjoined analysis of this statement will show the distribution of the commerce of New Granada for the year specified:

	Per cent.		Per cent.
England and colonies	80·83	Cuba.....	0·50
France.....	7·42	Holland.....	0·49
United States.....	4·28	Hanse Towns.....	0·40
Curacao.....	2·54	Mexico.....	0·27
St. Thomas.....	2·31	Spain.....	0·23
Sardinia.....	0·63	Nicaragua.....	0·10

The imports, during the same year, consisted of printed, dyed, and white cottons, calicoes, and other similar tissues; silks, linens, woollens, hardware, furniture, manufactures of metals, medicinal drugs, wines, spirits, flour, and provisions generally. The chief article of export was gold, of which the amount for this year was about \$1,000,000.

A comparison of exports for a number of years exhibits the fact, that the quantity of gold exported has either remained stationary or slightly diminished. The cause is not found in any deficiency in the auriferous resources of the country, as the mines of Antioquia, and those in the country along the Pacific, on the Rio Zulia and the Rio Hacha, contain large quantities of the precious metals; but the difficulties attending the transportation of heavy machinery, indispensable in working the mines of Antioquia, seem to be insuperable, beyond a certain weight. Until good roads shall have been established, and the mines thereby rendered more accessible, but little improve-

ment in the mining industry of this region (the richest in New Granada) can be expected.

Large quantities of gold, in ingots and dust, enter into the clandestine trade of the republic, of which no account can be taken in the official returns.

Next to gold, tobacco is the most important article in the export trade of New Granada, and its most productive staple. The soil, in many parts of the republic, is peculiarly adapted to the growth of tobacco, and its production might be made a source of the principal agricultural wealth of the State, under a different system of properly regulated industry. The quantity exported in 1848 exceeded that of the preceding year by 35 per cent.; and the returns for several preceding years exhibit a regular, though not so large, augmentation.

Cabinet-maker's wood and dye-stuffs rank next in the exports of the country. In 1848, they amounted in value to \$161,500. The large bulk of these products is sent to the United States, in part exchange for provisions, cotton goods, furniture, medicinal drugs, and sundries. Excellent coffee and cocoa are raised, chiefly in the valley of Cucuta; whence transported to Maracaibo, in Venezuela, they enter into the returns of Venezuelan exports.

In addition to these products of New Granada, a new species of bark has recently been discovered, which promises to become a valuable article of commerce. A letter from a mercantile house in London to a correspondent in New Granada, written in 1845, says: "We imported last year 17,000 seroons (hampers or baskets) of New Granada and 500 seroons of Bolivian bark. The New Granada all sold; but the Bolivian being held for a monopoly price, is still in the market—proving that this kind has very little demand."

Delondre, in his new work on quinine barks, gives an analysis of a New Granadian bark containing quite as much quinine as Bolivian calisaya. If the calisaya of Santa Fé, or fusagasuga and pitaya barks of New Granada, had been introduced into the market before the Bolivian, there would be no question about the quality of the alkaloids they yield.

There seems a probability that this New Granadian bark will soon enter largely into the export trade of that country. The chemical test to which it has been subjected in England, has already stamped it as a valuable acquisition to the materia medica; and the periodical scarcity of quinine, which sometimes raises that article to a most exorbitant price, will render it still more popular. In reference to this bark, and other valuable products of New Granada, a report submitted in July, 1856, to the French government, relative to the commercial movements of France in New Granada, says: "Formerly, that republic had no other equivalent to offer, in exchange for foreign merchandise, than the gold of its mines." The abolition, in 1853, of the monopoly of tobacco, however, has given a new stimulus to agricultural industry, and attracted numbers to the cultivation of that article. This agricultural movement is not the only benefit accruing to New Granada from the suppression of this monopoly. In bringing the capitalists of the country in contact with foreign merchants, it has taught them to appreciate better than formerly the immense wealth to be found in the soil of the republic. Thus, quinquina, which has remained almost unknown since the departure of the Spaniards, has been a second time discovered in 1853, and has already entered into their exports, and will soon become a considerable article among the staples of New Granada. The cultivation of cocoa, formerly limited to the consumption of the country, has also been largely extended, and is now become an article of export.

The navigation laws of New Granada, by a decree of the Senate and Chamber of Representatives of that republic, bearing date May 27, 1853, a translation of

which is subjoined, undergo some modifications in favor of foreign commerce, as follows :

ARTICLE 1. The following ports and territories of the province of Choco shall be free for all nations in the world, from January 1, 1854, for twenty years :

1. The ports of the Atlantic and the territory watered by the River Atrato, from its mouth to its confluence with the River Guito, comprehended between the western chain of the Andes and that branch of it toward the eastward which separates said province from that of Antio-Chin.

2. The ports of the Pacific and the territory watered by the River San Juan, from its embouchure, as far as the city of Navita, contained between the above-mentioned chain of the Andes and that branch of it which separates it toward the southward from the province of Buenaventura.

ART. 2. Consequently, no custom-houses can be established in said ports and territories within the time specified ; nor can any duties be levied, save those of toll, passage, and excise, corresponding to the municipal revenues, and in conformity with the existing laws.

ART. 3. In order to recover the duties on importation of foreign merchandise which may be introduced for the consumption of the interior of the rest of the province, and other provinces of the republic, there shall be established two custom-houses, one in the city of Quibdo, and the other in the city of Navita, with necessary officers, etc., etc.

ART. 4. The executive power is authorized, when it deems it indispensable for weighty motives of public convenience, to assign other ports for custom-houses than those expressed in this law ; in which case, the maritime ports expressed in article 1, and the territory comprised between the coasts and the spot on which such custom-houses shall be fixed, alone can enjoy freedom.

Another decree of similar importance to the interests of foreign commerce was published in the official paper of the New Granadian government of the 20th of July, 1856, in virtue of legislative authority, declaring Cartagena a free port for the commerce of all nations, from the 1st of September ensuing. By this decree, however, vessels will continue to pay tonnage duty, conformable to the law of the 25th of June last in relation to that subject. The exemption from import duties is circumscribed to the walled portion of the city, and hence does not apply to goods carried to the outside villages of Cabrero, Bocagrande, Espinal, and Manga i Pie de la Popa. Counterfeit money, and Spanish, Colombian, and Granadian money, under the standard of 0.900, as well as copper not sold for the use of the republic, are prohibited ; also, rum, and its compounds, so long as the legislature shall not decree the free manufacture and sale of that article. Vessels must exhibit the usual papers on entering the port ; and when a vessel is only going to leave a part of her cargo, the captain must, within twenty-four hours, present a manifest of what he intends to land, and what to leave on board. If the vessel come in search of a market, and not for the determined purpose of landing her goods, the captain will be allowed forty-eight hours to present a manifest of what he intends to land and what to retain on board. If the vessel come in ballast, a manifest will not be required, but the visiting officer will satisfy himself that such is the state of the vessel. A vessel from another port of the republic, or from a port of a nation in which, by virtue of stipulations entered into with this republic, by treaty or convention, merchandise put on board in the ports of such nation must be accompanied by bills of lading, will be required to produce bills of lading for articles which may have been shipped in said ports, and a general manifest for the remainder of the cargo not embraced in such bill. The captain or supercargo not fulfilling these regulations must leave port immediately ; first paying

tonnage duty, unless exempted from such payment by the law of the 25th of June, before cited. Vessels carrying a mail, and steam or sailing packets, shall be visited at any hour of the day or night, and in like manner their goods and the baggage of their passengers may be landed. A custom-house officer will board vessels at Bocachica. When the vessel contains goods subject to import duties, the hatchways, etc., shall be closed and sealed by the commanding revenue officer, packets being excepted from this regulation ; after which formality, the custom-house officers will retire, leaving a suitable guard, which shall be relieved daily. The seals on the hatches, etc., are not to be broken, except by the commanding officer who placed them there, or by his deputy. The decree embraces a number of additional provisions in relation to the discharge of cargo, custom-house inspection, re-exportation, etc., etc., and is accompanied by an explanatory note from the Secretary of the Treasury of New Granada.

The coasting trade of New Granada is open to all foreign vessels, but only foreign steamers are permitted to navigate the rivers of the republic. This is an important privilege to foreign vessels, and one which is destined to stimulate American enterprise in this neighboring republic. When the repairs of the canal connecting the harbor of Cartagena with the Magdalena, now in progress, under the superintendence of an American engineer, shall have been completed, the internal trade of New Granada will be the means of developing more fully its great resources, and bringing to market the tobacco, India rubber, quinia, hides, corn, cocoa, coffee, sugar, etc., the production of which can be increased to an incredible extent. When this canal shall have been completed, Cartagena will become the great emporium of New Granada—at least of 20 of the principal agricultural provinces, containing a population of 1,628,471 inhabitants. The present tariff regulations of New Granada, to be found in Part II., have been in force since May 1, 1855 ; but by a late act of Congress, the manumission duty of 20 per cent. is to be suppressed, and, in lieu, the additional duty of 25 per cent. on the total amount of the import duty is to be increased to 50 per cent. The port regulations of New Granada are such as are deemed necessary, as well in view of the general convenience and safety of vessels, as to answer proper police and harbor discipline. Places are pointed out into which all rubbish, etc., is to be thrown. Ballast is to be taken in and thrown out under written authority of proper officers. Cannon are not to be fired without permission of the captain of the port. At Cartagena, it is forbidden to sound the upper or interior channels of the port, or to have any communication with the shore between eight o'clock at night and five o'clock in the morning. It is also forbidden to disembark any individual before the visits of the officers of customs and captain of the port. For the violation of any of these regulations, fines are imposed, varying from 10 to 40 dollars, according to the nature of the case.

There are no quarantine regulations at any of the ports of New Granada, and consequently no bills of health are required. No light or hospital money is levied. No local impost is charged. At the port of Savanilla there is a water-tax upon all vessels arriving there of \$4 each, imposed by the provincial legislature. Pilots are employed and paid by government. Their duty is to visit all vessels requiring their assistance, and all vessels coming from a foreign port are required to pay the full fees, whether they take on board a pilot or not. The fee is \$11, in and out. There is also a fee of \$6 40 to be paid to the captain of the port on visiting the vessel, and \$1 60 for the interpreter. With the exception of the interpreter's fee, this amount is also levied on New Granadian vessels. By a decree of the Congress of New Granada, bearing date June 19, 1856, which, like that of July 20, already given, comes to hand as these sheets go to press, new regu-

lations respecting tonnage dues are established, of which a translation is given as follows: "Tonnage dues, port dues, pilotage, and visit fees, shall be the same in all the ports of the republic, including the free ports of the Isthmus of Panama, Cartagena, Choco, Buenaventura, and Tumaco, and the following sums shall be collected: 1. Every vessel under 100 tons shall pay 40 cents per Granadian ton for her capacity. 2. Every vessel exceeding 100 tons shall pay 40 cents per ton for the first 100 tons, and 20 cents per ton for each ton over the same. 3. Tonnage dues shall only be paid at the first port at which a vessel touches, proceeding from foreign countries: vessels proceeding from one port to another in the republic shall not pay tonnage dues. 4. War vessels of the country, or of friendly nations, and transports assimilated to them, which may touch at the ports of the republic, shall not pay tonnage dues. 5. The executive may exempt from tonnage dues, and permit to coast, sail or steam vessels that agree to convey the mails between the ports of the republic, and carry such correspondence gratis as may be entrusted to them. Those that do not agree to this, shall pay tonnage dues, cash, in hard dollars of the country. 6. Vessels arriving in ballast, or which load in New Granada, shall not pay tonnage dues; neither shall those chartered to bring immigrants to the republic, when the number of the same exceeds 50. Tonnage dues shall be charged at the Isthmus ports from the 1st September next; the product shall be divided equally between the State and general government."—*Com. Rel. U. S.*, vol. iii., 1857.

Since January 1, 1850, Panama, and all the other ports on the Isthmus, have been free—Aspinwall, of course, included. The only duties levied at these free ports are navigation dues, as above given; from which, however, the vessels in the service of the Panama railroad at Aspinwall are exempt by charter. In February, 1855, Panama was erected into an independent State, with the power vested in the legislature to establish custom-houses, or, in other words, to abolish the existing freedom of its ports. It is not very likely, however, that the new State will be disposed to take any legislative action by which the existing franchise of Aspinwall would be abolished, or even abridged. This new State has now become the principal centre of commercial interest in this republic. In 1852 there entered and cleared at its Pacific port (the port of Panama) 609 vessels, measuring an aggregate of 277,785 tons, of which 312 entered floating cargoes, including

specie, to the value of \$60,473,000; and there cleared 297 vessels, with cargoes valued at nearly \$500,000. In this movement, the number of vessels under the American flag was 169, measuring an aggregate of 163,113 tons; under the British flag, 188 vessels, measuring in all 83,070 tons; and under the French flag, 20 vessels, with an aggregate of 5836 tons. The freights under the United States' flag were valued at \$51,935,000; those under the British, at \$8,000,000; and the remainder of the total given above was distributed between the South American, French, and other European flags. The American and British freights included the gold dust brought down from California by the steamers for the former, and the silver brought up the coast for the latter, in neither case including the large amounts in the hands of passengers. See PANAMA.

The total amount of gold and silver which passed through Panama in transit in 1853 was \$52,037,785. The countries whence this sum was exported, and the amounts from each, are given as follows:

California.....	\$42,627,852
Mexico.....	2,765,000
Peru and Chili.....	6,584,876
Australia.....	60,557
Total.....	\$52,037,785

The total number of passengers who crossed the Isthmus the same year was 23,690, of whom 13,937 came from California, and 9753 were proceeding to that country. In 1855 the total number of passengers that crossed the Isthmus was 28,704. Of this number there came from California 10,015, and there proceeded to that State 16,289, all in American steamers; by the British steamers there came from Europe 1300 passengers, and there proceeded to Europe 1100. The transit of gold and silver the same year amounted to \$40,407,907. This amount was brought from the following points:

San Francisco.....	\$31,671,815
Chili and Peru.....	6,854,573
Mexico.....	1,867,961
Panama.....	513,558
Total.....	\$40,407,907

The total exports of New Granada, during the year ending December 31, 1853, amounted to \$30,849,595 65. Of this aggregate amount, Cartagena exported \$17,913,146; Cucuta, \$4,153,898; Guanapalo, \$14,312; Rio Hacha, \$628,069 40; Savanilla, \$8,105 728 25; Tumaco, \$34,412.

COMMERCE OF THE UNITED STATES WITH NEW GRANADA, FROM OCTOBER 1, 1840, TO JULY 1, 1856.

Principal Ports.—Chagres, a sea-port town of New Granada, Central America, on the northern coast of the Isthmus of Panama, at the mouth of the Chagres River, on the Caribbean Sea. Latitude of fort San Lorenzo 9° 18' 6" N., long. 79° 59' 2" W. It is a mere collection of huts, with a harbor only for vessels drawing 10 or 12 feet of water; but it has frequent traffic with Panama, and is sometimes resorted to by

shipping from the United States, Cartagena, and the British West Indies.

Panama, a city and sea-port town of New Granada, on the Pacific, 33 miles south-east of Chagres, lat. 8° 56' N., long. 79° 31' 2" W. Population estimated at 7000. It stands on a rocky peninsula, projecting into the Bay of Panama, and has an imposing aspect from the sea. Its streets are well ventilated, and it is said

to be cleaner than most Spanish American cities. It is encircled by irregular and not very strong fortifications, constructed at different periods. The houses are partly of wood, straw, and other fragile materials. The tides daily rise and fall from 20 to 27 feet, so that it is peculiarly well fitted for the repair and building of ships. The Panama railroad has one of its termini here, and another at Aspinwall, on Manzanilla Island, Navy Bay. Trains take about four hours in passing from sea to sea. See PANAMA.

Cartagena, or Carthagena, a strongly-fortified city and sea-port of New Granada, South America, of which republic it is the chief naval arsenal, capital of the province, on a sandy peninsula in the Caribbean Sea. Lat. of the dome $10^{\circ} 25' 36''$ N., long. $75^{\circ} 34'$ W. Population, 10,000, nine tenths of whom are a mixed black race. Its excellent port is defended by two forts, and is the only harbor on the north coast of New Granada adapted for repairing vessels. Cartagena is the principal dépôt for the produce of the provinces watered by the Cauca and Magdalena Rivers, and is connected with the Magdalena by a canal. It exports sugar, cotton, coffee, tobacco, hides, specie, bullion, etc. Under the Spaniards, this city was the seat of a captain-general, and one of the three tribunals of the Inquisition in America. It was the first town that proclaimed independence, and in 1815 endured a most vigorous siege, and was subdued only by famine. Population of the province, 103,783.

New Hampshire. It is situated between lat. $42^{\circ} 41'$ and $45^{\circ} 11'$ N., and $70^{\circ} 40'$ and $72^{\circ} 30'$ W. long. It contains 8,030 square miles.

Population in 1790, was 141,885; in 1800, 138,858; in 1810, 214,460; in 1820, 244,161; in 1830, 269,328; in 1840, 284,574; and in 1850, 317,864.

Early History.—John Mason, one of the first eminent settlers of the north-eastern coast of New England, having agreed with Sir Ferdinando Georges to make the Piscataqua the division line between them,

took subsequently from the Plymouth Council a patent of what lies between that river and Merrimack, and he called that tract of land "*New Hampshire*," because he had been Governor of Portsmouth, in Hampshire, in England.

In the year 1680 New Hampshire separated from the province of Massachusetts, and was established as an independent royal province. It was afterward united again with Massachusetts, but in 1749 finally separated, and has existed since that time as an independent community, first under the name of "*the Province of New Hampshire*," and since 1776 under that of "*the State of New Hampshire*."

The Connecticut River has its source in the highlands, on the north border of the State, and its west branch forms the boundary line between New Hampshire and Canada to within one mile of the 45th degree of north latitude. Its general course is south by west, and dividing New Hampshire and Vermont it passes through the western part of Massachusetts, and the central part of Connecticut, where it enters Long Island Sound. Merrimack River, the Pemigewassit branch, rises near the Notch in the White Mountains, and is joined by the Winnipiseogee, 70 miles below the source of the former. It here takes the name of Merrimack. The Androscoggin and Saco Rivers rise and have a part of their course in this State.

Granite is plentiful throughout the State, and also marble and limestone. Iron ore, zinc, tin, lead, and copper exist, some of which have been worked to advantage.

There were in this State in 1850, 2,251,488 acres of land improved, and 1,140,926 of unimproved land in farms. Cash value of farms, \$55,245,997, and the value of implements and machinery, \$2,314,125. *Live Stock.*—Horses, 34,233; asses and mules, 19; milch cows, 94,277; working oxen, 59,027; other cattle, 114,606; sheep, 334,756; swine, 63,487; value of live stock, \$8,871,901.

Manufactures, etc.—There were in the State in 1850, 43 cotton factories, with a capital invested of \$10,974,700, employing 2,915 males and 9,235 females, producing sheetings valued at \$8,861,749; 91 woolen factories, with a capital of \$2,547,500, employing 873 males, and 1,021 females, manufacturing 9,712,840 yards of cloth, and 165,200 lbs. of yarn, valued at \$2,439,967; 1 establishment with a capital of \$4,000, employing 30 persons, producing 200 tons of pig iron, etc., valued at \$17,200; 26 establishments with a capital of \$232,700, employing 374 persons, and making 5,764 tons of castings, etc., valued at \$371,710; 2 establishments with a capital of \$4,000, employing 6 persons, manufacturing 110 tons of wrought iron valued at \$10,400; 178 flouring and grist mills, 80 saw mills, 165 tanneries, with a capital of \$441,975, employing 513 persons; 40 printing offices, 2 daily, 36 weekly, 1 semi-monthly, and 2 monthly newspapers. Capital invested in manufactures, \$18,242,114; value of manufactured articles, \$23,160,503.

Agricultural Products, etc.—Wheat, 185,658 bushels; rye, 183,117; Indian corn, 1,573,670; oats, 973,381; barley, 70,256; buckwheat, 65,265; peas and beans, 70,856; potatoes, 4,304,919; value of products of the orchard, \$248,563; produce of market gardens, \$56,810; pounds of butter made, 6,977,056; of cheese, 3,196,563; maple sugar, 1,294,863; molasses, 9,811 gallons; beeswax and honey, 117,140 pounds; wool, 1,108,476; flax, 7652; silk cocoons, 4,191; hops, 257,174; tobacco, 50; hay, tons of, 598,854; clover seeds, 829 bushels; other grass seeds, 8,071; flax seed, 189; and were made 344 gallons of wine. Value of home-made manufactures, \$393,455; of slaughtered animals, \$1,522,873.

Principal Port.—Portsmouth is the only sea-port in the State. It is situated on the south side of the Piscataqua River, on a peninsula, three miles from the sea, lat. 43° 40' N., long. 70° 45' W. The harbor is one of the best in the world; it has 42 feet water at low tide through the whole channel, and the current is sufficient to prevent it from freezing. The United States' Navy Yard is located on an island near the main bank of the river. The city has valuable manufactures and a large foreign and country trade, and being intersected by the line of railroads between Boston and Portland is connected thereby with all the New England and Canada towns; a railroad also extends to Concord. The tonnage of Portsmouth in 1856, was 34,590 tons.

The principal places in this State are Concord, the capital, Manchester, Portsmouth, Dover, Exeter and Nashua. There were in 1856, 15 railroads, with 660 miles of track completed and in operation, and 24 in course of construction. The only canals are those facilitating the navigation of the Merrimack River.

For commerce, resources, etc., of New Hampshire, see *Hunt's Merch. Mag.*, iv., 346; *Am. Jo. Science*, xlix., 27; *Am. Quar. Reg.*, xiii., 170; *North Am. Rev.*, xviii., 33.

New Jersey lies between 38° 55' and 41° 24' N. lat., and between 73° 59' and 75° 29' W. long. It is 163 miles long and 52 broad, and containing 6,851 square miles.

Population in 1790, was 184,189; in 1800, 211,149; in 1810, 245,592; in 1820, 277,575; in 1830, 320,779; in 1840, 373,306; and in 1850, 489,555.

Early History of New Jersey.—The shore and territory of the present State of New Jersey were at first, since 1606, a part of the great English province of northern Virginia; and then (since about 1621) it was considered (at least by the Dutch) as a part of their *New Netherlands*.

The English, however, always claimed the country; and in the year 1648 Sir Edmund Ploydon and some English gentlemen received a charter and grant of a great tract of country "lying midway between New England and Maryland," to which the name of *New*

Albion was given. This is the first English name which this country received. The charter had, however, no great consequences. The Dutch remained in possession, and the name *New Albion* was forgotten.

When the English conquered the *New Netherlands* for the Duke of York, all this land was included in the large territory given to the Duke of York. But the Duke of York very soon sold (as early as the year 1664) that part of his grant which was lying between Delaware and Hudson's River to Sir George Carteret and John Lord Berkeley. The grant which he gave to them is dated on the 24th of June, 1664. The country received at once the name of New Jersey, in compliment of Sir George Carteret, whose ancestors came from the Island of Jersey, and who was himself Governor of the Island of New Jersey.

The Hudson and Delaware Rivers flow on the eastern and western sides of this State. The Raritan is navigable 17 miles to New Brunswick, and it enters Raritan Bay; the Passaic is navigable for small vessels for about 15 miles, and enters into Newark Bay; the Hackensack, navigable 15 miles, also enters Newark Bay. Great Egg Harbor River, navigable 20 miles for small craft, passes through a bay of the same name and enters into the Atlantic. The principal bays are Newark and Raritan. Delaware Bay is on its south-eastern border. It has two important capes, viz., Cape May on Delaware Bay, and Sandy Hook at the entrance of the Bay of New York. It contains quarries of good building stone, valuable mines of zinc and of iron, and in the south parts, beds of marl.

The principal places in this State are Trenton, the capital, Princeton, New Brunswick, Rahway, Elizabethtown, Jersey City, Hoboken, Paterson, Hackensack, Morristown, South Amboy, Freehold, Burlington, and Camden. There were in the State, July, 1857, 38 banks with a paid capital of \$5,147,741. The total tonnage of the State, January, 1853, amounted to 93,300 tons.

The northern part of the State is mountainous, being crossed by a branch of the Alleghany Ridge; the middle portion is agreeably diversified by hills and valleys; while the southern part is level, sandy, and mostly covered with pines and a scanty growth of shrub oaks. The northern and middle portions of the State have a fertile soil.

There were in the State in 1850, 1,767,991 acres of improved land, and 984,955 of unimproved in farms. Cash value of farms \$120,237,511; and the value of implements and machinery \$4,425,503. *Live Stock.*—Horses, 63,955; asses and mules, 4,089; milch cows, 118,736; working oxen, 12,070; other cattle, 80,455; sheep, 160,488; swine, 250,370; value of live stock, \$10,679,291.

Agricultural Products, etc.—Wheat, 1,601,190 bushels produced; rye, 1,255,578; Indian corn, 8,759,704; oats, 3,378,063; barley, 6,492; buckwheat, 878,934; peas and beans, 14,174; potatoes, 3,207,236; sweet potatoes, 508,015; value of products of the orchard, \$607,278; produce of market gardens, \$475,242; lbs. of butter made, 9,487,210; of cheese, 365,756; maple sugar, 2,197; molasses, 954 gallons; beeswax and honey, 156,694 lbs.; wool, 375,396; flax, 182,965; silk cocoons, 23; hops, 2,133; tobacco, 310; hay, 435,950 tons; clover seed, 28,280 bushels; other grass seeds, 63,051; flax seed, 16,525; and were made, 1,811 gallons of wine; value of home-made manufactures, \$112,781; of slaughtered animals, \$2,638,552.

Manufactures, etc.—There were in the State in 1850, 29 cotton factories with a capital invested of \$1,691,000, employing 739 males and 1,299 females, producing 8,122,580 yards of sheeting, etc., and 2,000,000 pounds of yarn valued at \$1,289,648; 61 woolen factories with a capital invested of \$410,650, employing 407 males and 137 females, manufacturing 771,100 yards of cloth, etc., valued at \$784,772; 9 establishments making pig iron, with a capital invested of

\$967,000, employing 600 persons, producing 24,031 of pig iron, etc.; entire value of products \$917,000; 45 establishments with a capital of \$593,250, employing 803 persons, making 10,259 tons of castings, valued at \$686,430; 53 establishments with a capital of \$1,016,843, employing 593 persons, manufacturing 8,162 tons of wrought iron valued at \$629,273; 391 flouring and grist mills; 75 printing offices, 61 newspapers, 8 daily,

50 weekly, and 3 monthly publications. Capital invested in manufactures, \$22,184,710; value of manufactured articles, \$39,134,514. The Delaware and Raritan Canal, 42 miles long, and the Morris, 102 miles long, are the canals in this State. There were, January 1, 1856, 11 railroads with an aggregate length of 504 miles in operation, and 29 miles in course of construction. The State of New Jersey has no public debt.

Principal Ports.—Jersey City is a flourishing city at the mouth of the Hudson River, opposite New York city, and is the terminus of the southern railroad travel, and also of the New York and Erie Railroad and of the Morris Canal. Though a separate municipality, it may be considered as a suburb of the great metropolis, with which it connects by several ferries. It is a place of considerable manufacturing industry, ship-building, and commerce, and it is the American station of the Cunard line of New York and Liverpool steamships.

Paterson is situated immediately below the falls of the Passaic River, 17 miles from New York. It ranks next to Newark in manufactures, and is the third city in the State as to population. Its principal products are cotton and silk goods, locomotives, machinery, paper, etc. On the opposite side of the river is the manufacturing town of Manchester. Paterson communicates with New York by the Paterson and Hudson Railroad and Morris Canal.

The other towns of note are Newark, New Brunswick, Camden, Trenton, and Princeton.

New London, Connecticut, is situated on the Thames River, 3 miles from the ocean, 50 miles east of New Haven by railroad. Its harbor is one of the best in the United States, but is seldom visited by foreign vessels. The whale fisheries constitute its main interest, and it has also a large coasting trade. Several railroads connect it with the interior, New York, and Boston, and regular steamboats ply to and

from New York. The tonnage in 1856, was 40,371 tons. Population in 1830, 4350; in 1854, 10,000.

New Mexico, a Territory of the United States of America, lies between lat. 32° 30' and 38° 32' N., and long. 103° and 116° W. from Greenwich, England. Area, 210,744 square miles.

New Mexico is a mountainous country, with an extensive valley in the middle, running from north to south, and formed by the *Rio del Norte*. The valley is generally about 20 miles wide, and bordered on the east and west by mountain chains, continuations of the Rocky Mountains, which have received here different names, as Sierra Blanca, de los Organos, Oscura, on the eastern side, and Sierra de los Grullas, de los Mimbres, toward the west. The height of the mountains south of Santa Fé is from 6000 to 8000 feet, while near Santa Fé, and in the more northern regions, some snow-covered peaks rise from 10,000 to 12,000 feet above the sea. The mountains are principally composed of igneous rocks, as granite, sienite, diorite, basalt, etc. On the higher elevations, excellent pine timber grows; on the lower, cedars, and sometimes oak; in the valley of *Rio del Norte*, mezquite. The main artery of New Mexico is the *Rio del Norte*. Its head waters were explored in 1807 by Captain Pike, between 37° and 38° N. latitude; but its highest sources are supposed to be about 2° further north in the Rocky Mountains, near the head waters of the Arkansas and the Rio Grande (of the Colorado of the west). Following a generally southern direction, it

runs through New Mexico, where its principal affluent is the Rio Chamas from the west, and winds its way then in a south-eastern direction along the borders of Chihuahua, Coahuila, and Tamaulipas, to the Gulf of Mexico, in 25° 56' N. lat. Its tributaries below El Paso, are the Pecos, from the north; the Conchos, Salado, Alamo, and San Juan, from the south. The whole course of the river, in a straight line, would be near 1,200 miles; but by the meandering of its lower half, it runs at least 2,000 miles from the region of perpetual snows to the almost tropical climate of the Gulf. The elevation of the river above the sea near Albuquerque is about 4,800 feet; at el Paso del Norte, about 3,800; and at Reynosa (between 300 and 400 miles from its mouth), about 170 feet. The fall of its water between Albuquerque and el Paso, is from 2 to 3 feet in a mile, and below Reynosa 1 foot in 2 miles. The fall of the river is seldom used as a motive power, except for some flour mills, which are oftener worked by mules than water. The principal advantage which is at present derived from the river, is for agriculture, by their well-managed system of irrigation. As to its navigation in New Mexico, even canoes could not be used, except perhaps during May or June, when the river is in its highest state from the melting of the snows in the mountains. The river is entirely too shallow, and interrupted by too many sand-bars, to promise any thing for navigation. On the southern portion of the river, the recent exploration by Captain Sterling, of the United States' steamer *Major Brown*, has proved that steamboats may ascend from the Gulf as far as Laredo, a distance of 700 miles. Although the steamboat used did not draw over two feet of water, yet the explorers of that region express their opinion, that "by spending some \$100,000 in a proper improvement of the river above Mier, boats drawing four feet could readily ply between the mouth of the Rio Grande and Laredo."

There were in this Territory in 1850, 166,201 acres of land improved, and 124,370 of unimproved land in farms. Cash value of farms \$1,653,952, and the value of implements and machinery \$77,960. *Live Stock*.—Horses, 5,079; asses and mules, 8,654; milch cows, 10,635; working oxen, 12,257; other cattle, 10,085; sheep, 377,271; swine, 7,814; value of live stock, \$1,494,629.

Agricultural Products, etc.—Wheat, 196,516 bushels produced; Indian corn, 365,411; oats, 5; barley, 5; buckwheat, 100; peas and beans, 15,688; potatoes, 3; value of products of the orchard, \$8,231; produce of the market gardens, \$6,679; pounds of butter made, 111; of cheese, 5,848; molasses, 4,236 gallons; bees-wax and honey, 2 pounds; wool, 32,901; hops, 50; tobacco, 8,467; and were made, 2,365 gallons of wine; value of home-made manufactures, \$6,033; of slaughtered animals, \$82,125.

Besides agriculture, the inhabitants of New Mexico pay a great deal of attention to the raising of stock, as horses, mules, cattle, sheep, and goats. Their stock is all rather of a small size, because they care very little for the improvement of the breed; but it increases very fast, and as no feeding in stables is needed in the winter, it gives them very little trouble. There are large tracts of land too distant from the water-courses to be cultivated, or in too mountainous parts, which afford, nevertheless, excellent pasturage for millions of stock during the whole year; but unfortunately the raising of the stock has been crippled by the invasions of the hostile Indians, who consider themselves secret partners in the business, and annually take their share away.

A third, much neglected branch of industry in New Mexico, are the mines. A great many now deserted mining places in New Mexico, prove that mining was pursued with greater zeal in the old Spanish times than since, which may be accounted for in various ways, as the want of capital, want of knowledge in

mining, but especially the unsettled state of the country and the avarice of its arbitrary rulers. The mountainous parts of New Mexico are very rich in gold, copper, iron, and silver. Gold seems to be found to a large extent in all the mountains near Santa Fé, south of it in a distance of about 100 miles, as far as *Gran Quivira*, and north for about 120 miles up to the River Sangre de Cristo. Throughout this whole region, gold dust has been abundantly found by the poorer classes of Mexicans, who occupy themselves with the washing of this metal out of the mountain streams. At present, the old and new *Placer*, near Santa Fé, have attracted most attention, and not only gold washes, but some gold mines, too, are worked there. They are the only gold mines worked now in New Mexico. Several rich silver mines were, in Spanish times, worked at Avo, at Cerrillos, and in the Nambe Mountains, but none at present. Copper is found in abundance throughout the country, but principally at las Tijeras, Jemas, Abiquiu, Gaudelupita de Mora, etc. There is but one copper mine worked at present south of the placers. Iron, though also abundantly found, is entirely overlooked. Coal has been discovered in different localities, as in the Raton Mountains, near the village of Jemez, south-west of Santa Fé, and in a place south of the placers. Gypsum, common and selenite, are found; most extensive layers of it exist in the mountains near Algodones, on the Rio del Norte, and in the neighborhood of the celebrated "Salinas." It is used as common lime for whitewashing, and the crystalline or selenite instead of window-glass.

Santa Fé is the capital of the Territory. There were in 1850, 3 printing offices in the Territory, issuing a weekly and a tri-monthly, and a monthly publication. In the same year there were 1 academy, with 40 pupils; 146 Roman Catholic churches. Total amount of church property valued at \$188,200.

The climate of New Mexico is of course very different in the higher, mountainous parts, from the lower valley of the Rio del Norte; but generally taken, it is temperate, uniform, and healthy. The summer heat in the valley of the river will sometimes rise to nearly 100° Fahrenheit, but the nights are always cool and pleasant. The winters are long and severe; the higher mountains are always covered with snow, and ice and snow are common in Santa Fé; but Rio del Norte is never frozen with ice thick enough to admit the passage of horses and carriages, as was formerly believed. The sky is generally clear, and the atmosphere dry. Between July and October, rain falls; but the rainy seasons are here not so constant and regular as in the southern States. Disease seems to be very little known, except some inflammations and typhoid fevers in the winter season.

Of the history of New Mexico we authentically know but little. The Spaniards, it seems, received the first information in regard to it, in 1581, from a party of adventurers, commanded by Captain Francisco de Leyva Bonillo, who, finding the aboriginal inhabitants and the mineral wealth of the country to be similar to those of Mexico, called it New Mexico. In the year 1594, the Count de Monterey, then viceroy of Mexico, sent Juan de Oñate, of Zacatecas, to take formal possession of the country, in the name of Spain, and to establish colonies, missions, and presidios (forts). They found many Indian tribes, which they succeeded in Christianizing in the usual Spanish way, with sword in hand, and made them slaves. The villages of the Christianized Indians were called *Pueblos*, in opposition to the wild and roving tribes that refused such favors. Many towns, of which only ruins exist now, were established at that time; many mines were worked, and the occupation of the country seemed secure, when, in 1680, a general insurrection of all the Indian tribes broke out, and the Spaniards, who were quite unsuspecting and unprepared, were

massacred almost to a man. The Governor of New Mexico, Don Antonio de Otermin, after a hard struggle, retreated from Santa Fé, and marched as far south as Paso del Norte, where he and his followers met with some friendly Indians, made a stand, and laid the foundation of the town of that name. The war with the Indians lasted 10 years, when the Spaniards reconquered the whole country. Subsequently, several insurrections have taken place, none, however, have been so disastrous as the first, but the deep rancor of the Indian race against the white, has continued to the present time. There has grown up a hatred between the Indians and the Mexicans, never to be subdued but with the extinction of the race.

Santa Fé was taken by General Kearney, September 8, 1846, and the Territory was ceded to the United States by the treaty of Guadalupe Hidalgo, February, 1848, and the present territorial government established in 1850. The legislative assembly consists of a council of 13 members, elected for 2 years, and a house of representatives, of 26 members, elected for 1 year. Governor appointed by the President of the United States for 4 years. Every free white inhabitant, 21 years of age, and a citizen of the United States, is a legal voter.

New Orleans, the capital of Louisiana, one of the United States, on the eastern bank of the Mississippi, about 105 miles from its mouth, lat. $29^{\circ} 57' 45''$ N., long. $90^{\circ} 9'$ W. Population, in 1850, 119,461. The new-built streets are broad, intersecting each other at right angles; and the houses are mostly of brick. It is the grand emporium of all the vast tracts traversed by the Mississippi, the Missouri, and their tributary streams, enjoying a greater command of internal navigation than any other city, either of the Old or New World. Civilization has hitherto struck its roots, and begun to flourish only in some comparatively small portions of the immense territories of which New Orleans is the sea-port; and yet its progress has been rapid beyond all precedent. It appears from the accounts printed by order of Congress, that during the year ended the 30th June, 1852, the value of the native American produce exported from this city amounted to \$48,808,169, while the value of that exported from New York was \$74,042,581. With respect to imports, the case is materially different; the value of those of New Orleans, in the year just mentioned, being only \$12,057,724, whereas those of New York amounted to \$132,329,306. It is believed by many, seeing how rapidly settlements are forming in the "West," that New Orleans must, at no very distant period, exceed every other city of America, as well in the magnitude of its imports as of its exports; and, considering the boundless extent and extraordinary fertility of the uncultivated and unoccupied basins of the Mississippi and Missouri, the anticipations of those who contend that New Orleans is destined to become the greatest emporium, not of America only, but of the world, will not appear very unreasonable. Steam navigation has been of incalculable service to this port, and, indeed, to the whole of the valley of the Mississippi. The voyage up the Mississippi, that used formerly to be so difficult and tedious, is now performed in commodious steam packets with ease, celerity, and comfort. "There have been counted," says Mr. Flint, "in the harbor, 1500 flat-boats at a time. Steam-boats are arriving and departing every hour; and it is not uncommon to see 50 lying together in the harbor. A forest of masts is constantly seen along the levee, except in the sultry months. There are often 5000 or 6000 boatmen from the upper country here at a time; and we have known 30 vessels advertised together for Liverpool and Havre. The intercourse with the Havana and Vera Cruz is great, and constantly increasing." As a shipping port, New Orleans now ranks third in the Union; being in this respect inferior only to New York and Boston. Vessels of the

largest burden may navigate the river several hundreds of miles above the city. The aggregate burden of the shipping belonging to the port on the 30th June, 1852, amounted to 266,013 tons; of which 162,637 were employed in steam navigation. In the year ending 31st August, 1852, the arrivals of steamers, principally from the interior, were 2784. The depth of water in the river opposite to New Orleans is, at a medium, about 70 feet; and it maintains soundings of 30 feet till within a mile of its confluence with the sea. Besides three or four of inferior consequence, the Mississippi has four principal passes or outlets. In the south-east, or main pass, at Balize, the water on the bar, at ordinary tides, does not exceed 12 feet; and as the rise of tides in the Gulf of Mexico is not more than 2 or $2\frac{1}{2}$ feet, vessels drawing much water can not make their way from the ocean to New Orleans. The unhealthiness of the climate is the great drawback on New Orleans. This probably arises from the low and marshy situation of the city and surrounding country, which is under the level of the Mississippi, being protected from inundation by an artificial levee or mound, varying from 5 to 30 feet in height, and extending along the bank of the river a distance of 100 miles. The unhealthy season includes July, August, and September; during which period the yellow fever often makes dreadful havoc, particularly among the poorer classes of immigrants from the North and from Europe. Latterly, great efforts have been made to improve the health of the city, by supplying it abundantly with water, paving the streets, removing wooden sewers, and replacing them with others of stone, etc. Many places, where water used to stagnate, have been filled up; and large tracts of swampy ground contiguous to the town have been drained. And as such works will no doubt be prosecuted on a still larger scale, according to the increase of commerce and population, it is to be hoped that the ravages of fever may be materially abated, though the situation of the city excludes any very strong expectation of its ever being rendered quite free from this dreadful scourge. It has latterly been proposed to bring earth from the upper parts of the Mississippi, and to employ it in forming a site for a new city raised some feet above the level of the river. It is believed that this would be the most likely means to guard against fever; and the object in view is of such paramount importance, that the expense of the scheme should be reckoned a very inferior matter.

Several cotton presses are among the most imposing structures in the city. The Orleans cotton press is on ground 632 feet long and 308 wide, which is nearly covered with buildings. It contains a centre building, three stories high, surmounted by a cupola, which affords a fine view of the city. The wings are two stories high, and very extensive. It presses, on an average, 150,000 bales of cotton annually, but its capacity is much greater. There are other cotton presses. Several of the banks have fine buildings, and some of the hotels are magnificent. Two of these hotels cost \$600,000 each. The United States' branch mint has an edifice, 282 feet long, and 108 feet deep, with two wings 29 by 81 feet, the whole, three stories high, which cost \$182,000. The city is supplied with water raised by powerful steam-engines from the Mississippi River into a reservoir constructed on an artificial mound, 21 feet high at its base. The reservoir is 250 feet square, built of brick, and plastered with hydraulic cement. It is divided into four compartments, to allow the water to settle before it is distributed over the city in cast-iron pipes, which are laid to the aggregate length of 18 miles. The water works belonged to the Commercial Bank, and cost \$722,004. The city lighted with gas. A draining company, with a capital of \$64,000, has two steam-engines for draining the marshes of 35 miles in extent between the city and Lake Pontchartrain. There are in the city a United

States' land office, several public and private banks, having a large capital, and several insurance companies, with commensurate capitals.

The manufacturing establishments of this city are comprised under the head of furnaces, foundries, machine shops, sugar refineries, cotton factories, distilleries, tobacco factories, saw mills, etc. The whole employed a capital in 1850 of \$2,962,060, and manufactured articles valued at \$4,462,944; since which time the increase has been very rapid, and in 1854 were estimated to have doubled the amounts of 1850.

On the right bank of the river, and opposite to New Orleans, connected by a steam ferry, is Algiers; and adjoining, the suburb of Macdonough, where are the United States' Marine Hospital and many pleasant residences. Algiers contains several large machine shops, iron foundries, and ship-building establishments.

There are steam and sailing packet lines to all the large sea-port cities, sailing weekly. Also, steam packets weekly to Vera Cruz and other ports in the Gulf.

For commercial purposes, New Orleans occupies a very superior and commanding situation. It is the natural entrepôt for supplies destined to all parts of the Mississippi valley, as well as the dépôt for those products of that salubrious region which seek a market seaward. By means of the Mississippi River and its tributaries, an inland trade is opened to her grasp, the magnitude of which has never been equaled. Steamers may leave her wharves and proceed on voyages of several thousand miles without breaking bulk. The Mississippi and its affluents are flanked on either side by extensive territories, unsurpassed in richness of soil, which readily yield a harvest to the labors of the agriculturist, whether it be of sugar, corn, or cotton. These are the principal staples of the valley, and the receipts of each of their products at New Orleans are rapidly increasing. Heretofore, the river has been the only channel depended upon for their transportation. Several lines of railroad are in process of construction now, however, to facilitate the transportation of cotton and sugar produced at a distance from the river, to market, and thus enlarge the area of production. These bulky products will not bear an extensive land carriage by the old mode, and result in wealth to the producer; but the construction of railroads for their cheap transit to the river even, will not only change the prospects of the interior planters for the better, but will add greatly to the wealth and commerce of New Orleans, which is eminently a place of exchange and distribution. It is the great dépôt of the south-western plantations, where cotton and sugar crops are bought and sold while still in the field, or "advanced" upon prospectively if necessary. It has also an extensive trade with Texas, Mexico, and the Gulf ports, as well as a very heavy foreign export trade. She has, besides, a large coasting trade with Atlantic ports, the value of which can only be known generally by its results. Her commercial life may be said to date after the cession of Louisiana to the United States, in 1803, as previous to that, her commerce was insignificant; and yet, in this short period of about 40 years, she already ranks as the fourth city of the world for the magnitude and value of her commerce. The facilities and convenience of transacting business at New Orleans are fully equal to, and in many respects superior to those of any other place. It is the centre of immense exchange operations, and any amount of funds can at all times be obtained at the shortest notice under good letters of credit, and bills negotiated with great readiness and facility on any prominent point in the United States, or any of the commercial cities of western Europe; and the banking institutions afford all reasonable accommodations to the local wants and trade of the city. Some European cities can show more splendid quays or magnificent docks for the accommo-

dation of shipping, and the landing and loading of cargoes, far exceeding in appearance and durability any thing of the kind in New Orleans, but in no way superior in point of actual convenience to the unpretending wharves of the city. As is generally known, the surface of the alluvial soil of Louisiana, including, of course, the site of the city, is considerably below the river in ordinary stages of high water, and the country is protected from inundation by a raised and solid embankment called the "levee," extending on both sides of the river below, and a great distance above the city. Outside of the levee the bank of the river is called the "batture," which in many places is increasing from the continual alluvial deposits, while in other places the river has what is called "a falling bank," and the water gradually encroaches on the land. In the former case the levee is advanced as the batture increases, and this has been the case in a large portion of the front of New Orleans, where, in some parts, the levee has, in the last 25 years, advanced fully 1000 feet; and the front warehouses now stand for a long extent that distance from the water, affording a splendid space for the vast bulk of produce that is annually landed and shipped. The wharves are constructed outside the levee on massive piles, driven with a heavy iron ram into the mud, and extending over the river into the water sufficiently deep to admit the heaviest steamboats and ships to lie up against them; heavy sleepers connect the piles at their tops, and on these piles the platform is laid, of thick planking, the edges of which are separated about one inch, to prevent the accumulation of dirt, which falls through these interstices into the river flowing below, and in five minutes after the heaviest storm the whole surface is in perfect condition to receive any description of merchandize. These wharves are thus planked back till they join the crown of the levee, in some places 150 to 200 feet, which is made firm and solid by a constant coating of shells, and always kept in good order. One of these wharves presents an unbroken front on the river of 1500 feet, and others 600 to 800 feet, and in the business season it is usual to see these fronts entirely occupied with steamboats lying bow on, and each with her stage rigged out to the wharf, actively engaged in loading or unloading. The wharves intended for sea-going vessels are detached from each other with an intervening dock, and each wharf accommodates a tier of vessels, which, unlike the steamboats are moored up and down the river, one outside the other, three, four, and five tiers deep, with a broad, common stage communicating with the levee, and extending on the bulwarks of the vessel to the outside one; the timber, plank, and all the conveniences for this staging, being furnished by the city, who even also supply tarpaulins to protect the goods in case of rain.

New Orleans was founded by the French in 1717. In 1762 it was conveyed to the Spanish, who, in 1800, re-conveyed it to the French, and in 1803 it was included in the purchase of Louisiana by the United States. On January 8th, 1815, the British under General Packenham made an attack on the city, approaching it through Lake Borgne, but were signally defeated by the Americans under General Jackson. The British loss in killed and wounded was 3000 men, and General Packenham was killed; the Americans lost only 7 men killed and 6 wounded. In 1718 Bienville, at that time governor of the province, selected the present site of New Orleans, but owing to difficulties he had to encounter, it was not located until 1722. In 1727 the Jesuits arrived and were located in a tract of land, on a portion of which St. Charles Hotel now stands. In 1763 they were compelled to quit Louisiana by an order from Pope Clement XIII., and all their property confiscated, then estimated to be worth \$180,000, which is now worth over \$20,000,000. In 1769 the first case of yellow fever known, was introduced by a British slaver with a cargo from Africa.

In 1778 *Le Moniteur*, the first newspaper, was published; there are now 12 dailies and as many weekly papers published. In 1810 the first street was paved in New Orleans. At this time such was the state of the streets after a rain, that sleds were used to drag cotton, which paid \$1 a bale. In 1834 gas and water were introduced. The present area of the city is not far from 40 square miles, double the size of New

York. In 1825 the grounds above Canal-street and below Esplanade-street were principally plantations.

The following statistics give a complete view of the trade of this great and growing emporium. Its preponderance in shipment of cotton is as decided as that of Manchester in its manufacture: for further information refer to articles, COTTON, COTTON MANUFACTURE, GREAT BRITAIN, LOUISIANA, UNITED STATES.

EXPORTS OF COTTON AND TOBACCO FROM NEW ORLEANS FOR SIX YEARS, COMMENCING SEPTEMBER 1, AND ENDING AUGUST 31.

New Orleans Levee Dues.—The subjoined ordinance, passed by the Common Council of the city and approved by the mayor, May 28, 1852, is now in force:

An Ordinance to Regulate the Levee and Wharfage Dues on Ships and Vessels arriving from Sea, and on Steamboats, Flats, Barges, etc.—ARTICLE 1. That from and after the passage of this ordinance the levee or wharfage rates on ships or other sail vessels, steamships, steamboats, flats, barges, and other craft, shall be fixed as follows: On all ships or sail vessels of 1,000 and under, 25 cents per ton. Excess of tonnage over 1,000 tons, 20 cents per ton. On all steamships, 17½ cents per ton. On all steamboats of 1,000 tons and under, 15 cents per ton. Excess of tonnage over 1,000 tons, 10 cents per ton; *provided*, the boats arriving and departing more than once each week, shall pay only two thirds of these rates. On each flatboat not measuring over 80 feet, \$10. On each flatboat measuring 80 to 100 feet, \$12. On each flatboat measuring over 100 feet, \$15. On each barge more than 70 feet long, \$12. On each barge less than 70 feet long, and not exceeding 15 tons burden, \$8. On each steamboat hull used as a barge, \$25. On each scow and coastwise pirogue, \$2. For every flatboat, barge, or other vessel, not including steamboats, employed in the transportation of brick, lumber, or other building materials, or in bringing produce from this and neighboring parishes to this city, and measuring not over 25 tons, the levee and wharfage dues shall be \$30 per annum. From 25 to 50 tons, \$60 per annum. Over 50 and not exceeding 75 tons, \$80 per annum. Over 75 and not exceeding 100 tons, \$125 per annum. Over 100 tons, \$200 per annum.

ARTICLE 2. Every proprietor of any small craft of the description above-mentioned, who shall desire to enjoy the privilege accorded by the present ordinance, must apply to the treasurer of the city of New Orleans for the purpose of obtaining a license, approved by the mayor, and countersigned by the controller, which license shall specify the number or name of such craft, which shall be painted in a conspicuous place on the side of the said craft.

ARTICLE 3. Hereafter it shall not be lawful for any pirogue, flatboat, barge, boat, or keelboat, to remain in port longer than eight days, under the same provisions and penalties contained in Article 3, of an ordinance of the General Council, approved May 20, 1843.

ARTICLE 4. That the payment of the levee dues on ships or sail vessels, steamships, and steamboats, shall be exacted and collected by the collectors of levee dues, and an extra duty of one third these rates shall be paid by all sail vessels or steamships which may remain in port over two months, the same, to be recovered at the commencement of the third month; and if over four months, an additional duty of one third these rates. Steamboats shall be entitled to remain thirty days in port after payment of the dues. All over thirty days to pay an additional duty of \$2 per day.

ARTICLE 5. That all vessels now in port, and that have paid a daily or weekly wharfage, shall be allowed (and the collectors are hereby authorized) to deduct the amount so paid from the rates now to be collected. All ordinances or parts of ordinances conflicting with the foregoing be, and the same are hereby, repealed.

TARIFF OF COMMERCIAL CHARGES AND RATES ADOPTED BY THE NEW ORLEANS CHAMBER OF COMMERCE, IN 1846 AND 1848, AND AMENDED MAY 10, 1852.

For commerce, etc., of New Orleans, see *Bankers' Magazine*, ii., iii., iv.; *HUNT'S Mer. Mag.*, iv., v., vi., vii., ix., xi., xiii., xv., xxv., etc.; *DE BOW'S Rev.*, ii., 53 (by W. L. HODGE), iii., 39, 235, 112 (by S. J. PETERS), vi., 433, viii., 1, xi., 387, 474, vii., 412, x., 505.

New South Wales. Prior to 1836, official returns exhibit no evidence of any trade between the United States and New South Wales. In that year six American vessels entered the harbor of Sydney with freights valued at \$69,510, and carrying home staples and other colonial produce to the amount of \$92,970. From that period to 1850 but little advance was made either in the import or export trade with that colony; the highest return being that for 1841, which shows the following summary:

Vessels from the United States entered the ports of New South Wales, in 1841, 13; tonnage, 4,754.

TRADE WITH THE UNITED STATES.

	1841.	1852.	1853.
Imports from U. S.....	\$176,410	\$148,450	\$1,098,975
Exports to U. S.....	24,155	25,405	15,140

The principal imports from the United States to New South Wales are: Apparel, bags and sacks, butter and cheese, candles (tallow and sperm), carts and wagons, coffee, preserves, drugs and medicines, salt fish, flour and bread, fruits, furniture, glassware, oats, rice, and barley, hardware and ironmongery, ice, leather manufactures, linens, provisions, spirits (chiefly rum and whisky), stationery and books, sugar, tobacco, woodenware, watches and clocks, and wine. The principal exports to the United States from New South Wales are: Coals and coke, lard, etc. The leading staple of New South Wales is wool; but it can not be imported into the United States advantageously, while it is admitted free into British ports. The total exports of wool from New South Wales during the four years ending with 1853, were 56,984,938 pounds, valued in the colony at \$16,465,320.

Newspapers, publications in numbers, consisting commonly of single sheets, and published at short and stated intervals, conveying intelligence of passing events. It is foreign to the purpose of this work to consider the moral and political effects produced by newspapers; of the extent of their influence there is no doubt, even among those who differ widely as to its effect. Their utility to commerce is, however, unquestionable. The advertisements or notices which they circulate, the variety of facts and information they contain as to the supply and demand of commodities in all quarters of the world, their prices, and the regulations by which they are affected, render newspapers indispensable to commercial men, supersede a great mass of epistolary correspondence, raise merchants in remote places toward an equality, in point of information, with those in the great marts, and wonderfully quicken all the movements of commerce. But newspapers themselves have become an important commercial article.

The first newspaper published in England, which might truly be considered as a vehicle of general in-

formation, was established by Sir Roger L'Estrange, in 1663; it was entitled the *Public Intelligencer*, and continued nearly three years, when it ceased on the appearance of the *Gazette*. A publication, with few claims however to the character of a newspaper, had previously appeared; it was called the *English Mercury*, and came out under the authority of Queen Elizabeth, so early as 1588, the period of the Spanish Armada. An early copy of this paper is dated July 23, in that year. In the reign of James I., 1622, appeared the *London Weekly Courant*, and in the year 1643 (the period of the civil war) were printed a variety of publications, certainly in no respect entitled to the name of newspapers, of which the following were the titles:

England's Memorable Accidents, The Kingdom's Intelligencer, The Diurnal of Certain Passages in Parliament, The Mercurius Aulicus, The Scotch Intelligencer, The Parliament's Scout, The Parliament's Scout's Discovery, or Certain Information, The Mercurius Civicus, or London's Intelligencer, The Country's Complaint, etc., The Weekly Account, Mercurius Britannicus.

A paper called the *London Gazette* was published August 22, 1642. The *London Gazette* of the existing series, was published first at Oxford, the court being there on account of the plague, November 7, 1665, and afterward at London, February 5, 1666. The printing of newspapers and pamphlets was prohibited 31 Charles I., 1680.—SALMON'S *Chron*. Newspapers were first stamped in 1713. Number of the stamps issued in England:

Year.	No.	Year.	No.
1753.....	7,411,757	1825.....	26,950,693
1760.....	9,404,790	1830.....	30,153,741
1774.....	12,300,000	1835.....	32,574,652

1800.....	16,084,905	1845.....	56,443,977
1810.....	20,172,857	1849.....	76,569,235
1820.....	24,362,186		

The total number of newspapers published in the United Kingdom in 1849 was 603, viz.: 160 in London, 232 in the English provinces, 117 in Ireland, and 94 in Scotland. The number of advertisements inserted in the London newspapers in 1849 was 886,108, paying a gross duty of £66,458 2s.; in the English provincial newspapers, 834,729, yielding to the crown a revenue of £62,604 18s. 6d.; in the Irish papers, 220,524, paying £11,026 4s.; and in the Scotch papers, 240,911, paying in duty £18,075 16s. 6d.

Newspapers, etc., in the United States.—The *Boston News Letter* was established in 1704, which was continued till 1774; the second was the *Boston Gazette*, 1719; the third the *American Weekly Mercury*, at Philadelphia, started one day after the last. First *New York Gazette*, in 1725; first newspaper in the Carolinas, at Charleston, 1731-2; first *Rhode Island Gazette*, at Newport, 1732; first *Virginia Gazette*, at Williamsburg, in 1736. In 1775 there were in all the colonies 37 newspapers; in 1810, in the United States, 358; in 1828, 802; in 1839, 1555, and in 1850, 2526.

Newspapers in France.—The first was the *Gazette de France*, established by Renardot, in 1631, and continued with few interruptions till 1827, when it ceased and another paper assumed its name. The *Moniteur*, commenced in 1789, has been since 1800 the official journal of the government. The *Constitutionnelle* and the *Journal des Debats* have long had the largest circulation. There were 374 newspapers published in France in 1832. See PERIODICAL LITERATURE.

Newspapers, Irish.—The first Irish newspaper was PUE'S *Occurrences*, published in 1700. FAULKNER'S *Journal* was established by George Faulkner, "a man celebrated for the goodness of his heart, and the weakness of his head," in 1728.—*Supplement to Swift*. The oldest of the existing Dublin newspapers is the *Freeman's Journal*, founded by the patriot, Dr. Lucas, about the year 1755.—*Westm. Rev.*, January, 1830. The *Lim-*

erick Chronicle, the oldest of the provincial prints, was established in 1768.—*Idem*.

Notices of Newspapers.—The history of newspapers, and of periodical literature in general, remains to be written; and were the task executed by an individual of competent ability, and with due care, it would be a most interesting and important work. It appears, from the researches of Mr. Chalmers, that the first newspaper published in modern Europe made its appearance at Venice in 1536; but the jealousy of the government would not allow of its being printed; so that, for many years, it was circulated in manuscript! It would seem that newspapers were first issued in England by authority during the alarm occasioned by the approach of the Armada to her shores; in order, as was stated, by giving real information, to allay the general anxiety, and to hinder the dissemination of false and exaggerated statements. From this era, newspapers, of one sort or other, have, with a few intermissions, generally appeared in London, sometimes at regular, and sometimes at irregular intervals. During the civil wars, both parties had their newspapers. The earliest newspaper published in Scotland made its appearance under the auspices of Cromwell in 1652. The *Caledonian Mercury* was, however, the first of the Scotch newspapers of native manufacture; it made its appearance at Edinburgh, under the title of *Mercurius Caledonius*, in 1660; but its publication was soon afterward interrupted. In 1715 a newspaper was, for the first time, attempted in Glasgow.

To Boston belongs the honor of establishing the first newspaper in North America. It was issued in the year 1690. It was deposited in the State Paper Office, in London, and stopped by the government. It was of the size of an ordinary sheet of letter paper. One copy of it alone was known to be in existence, and that it was that shared the luckless fate above-named. The first regular paper that was issued was also of Boston. Its title was the *News Letter*, its date was 1704, and it was printed by John Allen, in Padding Lane. We have seen some of its early numbers, and they are peculiar. Its latest news from England was dated one hundred and twenty days previously, and consisted of a speech of Queen Anne to Parliament. An advertisement informs us that the mail between Boston and New York set out once a fortnight. Negro men, women, and children were advertised for sale, and an urgent appeal appeared in one, calling upon a female who had stolen a piece of fine lace, valued at 14 shillings a yard; and upon another who had conveyed a piece of fine calico from its proper destination, under her riding-hood, to return the same or suffer exposure in the newspapers. For 74 years this paper continued in existence as the leading Tory paper. About these days, the revolutionary struggle drawing near, the *Boston Gazette* was issued at Watertown as the organ of the patriots. When the war broke out, there were 37 newspapers being published in the United States; eight of them were committed to the interests of the British, and five others were brought over to the government side.

Old Papers.—The *Worcester Spy*, published in 1770, is the oldest existing paper of Massachusetts. There are copies extant of the *Albany Journal*, or the *Montgomery, Washington, and Columbia Intelligencer*, printed in 1788. It was issued semi-weekly, at a subscription price of 12 shillings per annum. Its size was about 11 by 13 inches. Charles K. and George Webster & Co. were its publishers. Its leading article is an extract from a letter from Philadelphia, dated February 20, as follows: "On Saturday last, upon the arrival of the news of the ratification of the Federal Constitution by the powerful State of Massachusetts, the bells of Christ Church were rung, and congratulations of joy have appeared in every part of the city for several days." The "latest news from Europe" is made a feature of the sheet; it bears date December

1787, by which it would appear that it took some three months to cross the water.

New York and her Newspapers.—The position which this city sustains, as compared with any other city of the world, in the number and circulation of her journals, can be adjudged by a glance at the following table, which gives the supposed number of newspapers in the world, 1852–56:

Austria.....	10	Belgium.....	65
Africa.....	14	Denmark.....	85
Asia.....	30	Germanic States..	850
Great Britain and		Portugal.....	26
Ireland.....	500	Spain.....	24
Russia and Poly-		United States.....	2,800
nesia.....	50		

Of these, New York alone issues 122 sheets, as follows: secular journals, daily, morning, 8; evening, 6; semi-weekly, 2; weekly, 59; German dailies, 3; weeklies, 8; French daily, 1; Spanish weeklies, 2; Welsh, 3; of religious weeklies, there are 29 sheets. It is difficult to obtain a correct estimate of the present circulation of so many papers. Of the daily papers, at least 250,000 copies must be circulated; while 13 religious weeklies are spread before 150,000 subscribers.

The whole number of newspapers and periodical publications in the United States on the 1st of June, 1852, amounted, according to the official returns, to about 2,800. Of these, 2,494 were fully reported upon,

while the particulars with respect to the others were in part estimated.

From these returns, etc., it appears that the aggregate circulation of papers and other publications was about 5,000,000; and that the entire number of copies printed annually in the United States, amounted to about 422,600,000. The following table shows the number of daily, weekly, monthly, and other issues, with the aggregate circulation of each class:

	No.	Circulation.	No. of copies printed annually
Daily Journals.....	850	750,000	235,000,000
Tri-weekly.....	150	75,000	11,700,000
Semi-weekly.....	125	80,000	8,320,000
Weekly.....	2,000	2,875,000	149,500,000
Semi-monthly.....	50	300,000	7,200,000
Monthly.....	100	900,000	10,800,000
Quarterly.....	25	20,000	80,000
Total.....	2,800	5,000,000	422,600,000

Four hundred and twenty-four journals were issued in the New England States; 876 in the Middle States; 716 in the Southern States; and 784 in the Western States. Of the whole 2,800 publications, about 2,200 were newspapers, properly so called; the residue being scientific, religious, and educational journals. The average circulation of the mere papers was 1,785. There was one publication for every 7,161 free inhabitants in the United States and Territories. The following summary is based on the official returns:

NEWSPAPERS AND PERIODICALS PUBLISHED IN THE UNITED STATES IN 1850.

States & Territories.	Daily.		Tri-weekly and semi-weekly.		Weekly.		Semi-monthly.		Monthly.		Quarterly.		Aggregate.	
	No.	No. copies printed annually.	No.	No. copies printed annually.	No.	No. copies printed annually.	No.	No. copies printed annually.	No.	No. copies printed annually.	No.	No. copies printed annually.	No.	No. copies printed annually.

New Style. Ordered to be used in England in 1751; and the next year eleven days were left out of the calendar—the 8d of September, 1752, being reckoned as the 14th—so as to make it agree with the Gregorian Calendar, *which see*, and also article CALENDAR. In the year A.D. 200, there was no difference of styles; but there had arisen a difference of eleven days between the old and the new style, the latter being so much beforehand with the former: so that when a person using the old style dates the 1st of May, those who employ the new, reckon the 12th. From this variation in the computation of time, we may easily account for the difference of many dates concerning historical facts and biographical notices.—M.

New York, one of the United States of America, situated between $40^{\circ} 30'$ and $45^{\circ} 01'$ N. lat., and between $71^{\circ} 50'$ and $79^{\circ} 56'$ W. long., and contains an area of 46,000 square miles. The population in 1790 was 340,120; in 1800, 586,050; in 1810, 959,049; in 1820, 1,372,812; in 1830, 1,913,508; in 1840, 2,428,921; and in 1850, 3,097,394.

Early History of New York State.—The Spaniards comprised the territory of the present State of New York under their great name of Florida, and designated it also on their maps of the sixteenth century particularly as the “Tierra de Stephen Gomez,” or shorter “Tierra de Gomez,” because Gomez (1525) was for a long time the only Spanish navigator who was known to have explored especially these coasts. The English comprised it since 1585 under the name Virginia, and since 1606 under the name of Northern Virginia, or the Northern Colony. Since 1616 they considered it as a part of New England, which name took the place of the old name of Northern Virginia, and went down like this as far south as the fortieth degree of north latitude. The Dutch began soon after the discovery of Hudson (1609) to call it “Nieuw Nederland” (the New Netherlands). This name may already have been in use for some time, but it occurs for the first time in a public document in the year 1614. They also sometimes called it “Nieuw Holland.” It is on maps also sometimes called “New Belgium.” They at first gave to it very extensive boundaries, as far east as Cape Cod, including the whole Barnstable peninsula, and south as far as the Delaware River and beyond it. With these limits we find it represented on many old Dutch maps. The southern limit on the Delaware River remained pretty much unchanged on the Dutch maps. Not so the eastern boundary. On later maps we see this advancing only as far as Nassau Bay, Rhode Island. Since 1630 or 1635 the maps have it only as far as the Connecticut River, where at this time the English had already arrived with their plantations. When, in the year 1664, the English conquered the whole country, it was named the “Province of New York,” in honor of James, Duke of York, brother of Charles II. It lost in the same year a part of its coast by the grant which the Duke of York made to a company of gentlemen who founded the province of New Jersey, between the lower Hudson and the Delaware Bay.—J. G. KOHL.

When the province became, in 1776, a State, the name remained unchanged, and also the limits along the coast.

Physical Features.—This State is divided into three unequal parts, by two great valleys, viz.: 1st. The valley of the Hudson, including the depression in which Lake Champlain is situated, or, more properly, the valleys of the Hudson and Champlain united. 2d. The valleys of the Mohawk, and Oneida Lake, and

Oswego River, united. The eastern division is a long narrow belt, extending from New York island to the head of Lake Champlain. Its eastern limits are the borders of Connecticut, Massachusetts, and Vermont, with a slope westward to the Hudson, traversed longitudinally by several narrow valleys. This division comprehends the western slope of the Taghkanic mountains, which form the *water-shed* that separates the waters flowing into the Hudson, from those which flow into Long Island Sound. The north division of the State is traversed by the Clinton range. There are several subordinate ranges connected with this group. It begins at Little Falls, in the valley of the Mohawk, and pursues a north-east course across the country to Trembleau Point, on the west shore of Lake Champlain. There are numerous lofty peaks which formed a remarkable group, and have been styled the Adirondack mountains. Mount Marcy, the highest of the range, attains to an elevation of 5,467 feet above the sea. This ridge presents the *water-shed* of the region dividing the waters of the Hudson, or those which flow south into the Atlantic, from those which flow into the Gulf of St. Lawrence. The south division is situated between Lake Ontario and the Mohawk, and the Hudson valleys and Pennsylvania. It rises with a gradual ascent until it reaches its maximum height near the southern boundary of the State. The south-eastern part of this division is comprised in three ranges, viz., the Highlands, broken through by the Hudson, the Shawangunk, and the Catskill. There were in this State in 1850, 12,408,964 acres of land improved, and 6,710,120 of unimproved land in farms. Cash value of farms, \$554,656,642, and the value of implements and machinery was \$22,084,926. *Live Stock.*—Horses, 447,014; asses and mules, 963; milch cows, 981,324; working oxen, 178,909; other cattle, 767,406; sheep, 3,453,241; swine, 1,018,252; value of live stock, \$73,570,499.

Agricultural Products, etc.—Wheat, 13,121,498 bushels; rye, 4,148,182; Indian corn, 17,858,400; oats, 26,552,814; peas and beans, 741,546; barley, 3,585,059; buckwheat, 3,183,955; potatoes, 15,368,368; sweet potatoes, 5,629; value of products of the orchard, \$1,761,950; produce of market gardens, \$912,047; pounds of butter made, 79,766,094; of cheese, 40,741,413; maple sugar, 10,357,484; molasses, 56,539 gallons; beeswax and honey, 1,755,830 pounds; wool, 10,071,301 pounds produced; flax, 940,577; silk cocoons, 1,774; hops, 2,536,299 pounds; tobacco, 83,189; hay, 3,728,797 tons; hemp, 4 tons; clover seed, 88,222 bushels; other grass seeds, 96,493; flax seed, 57,963; and were made 9,172 gallons of wine; value of home-made manufactures, \$1,280,333; of slaughtered animals, \$13,573,883.

The principal rivers are the Hudson, 324 miles long, navigable 156 miles to Troy. The Mohawk, 135 miles long, which enters the Hudson a little above Troy; the Genesee, 125 miles long, which enters Lake Ontario, having at Rochester, 5 miles from its mouth, 2 falls of 96 and 75 feet. Black River, which rises near the sources of the Hudson, and flows 120 miles into Lake Ontario; the Saratoga, 65 miles long, entering Lake Champlain at Plattsburg; the Oswegatchie, 100 miles long, flowing into the St. Lawrence; the Oswego, proceeding 40 miles from Oneida Lake into Lake Ontario; the Au Sable, rising in the Adirondack mountains, and having a course of 75 miles to Lake Champlain. The majestic St. Lawrence forms a part of the northern boundary of the State. The head branches of the Susquehanna, the Alleghany, and the Delaware, rise in this State. Besides Lakes Ontario and Erie on the north, and Champlain on the east, which are but partly within it, there are wholly within the State many picturesque sheets of water, viz., Lakes George, Oneida, Skanateles, Oswego, Cayuga, Seneca, Crooked Lake, Canandaigua, and Chautauque. The islands belonging to New York are—Long Island,

120 miles long from west to east, with an average width of about 15 miles, within whose waters on the east are Fisher's, Shelter, Robin's, and some other islands. Staten Island, south-west of the harbor of New York, 18 miles long, and 8 wide. Manhattan Island, on which the city of New York stands, 13½ miles long, and about 1½ wide at an average breadth. Grand Island, in Niagara River, 12 miles long, and from 2 to 7 wide, and extending to within a short distance of the Falls. The harbor of New York is one of the finest in the United States. On the bar at Sandy Hook it has a depth of from 21 to 27 feet. Sag Harbor on the east, and Brooklyn on the west end of Long Island, have good harbors; Sackett's Harbor has a good natural, and Oswego a good artificial harbor on Lake Ontario. Buffalo and Dunkirk are harbors on Lake Erie.

Manufactures.—There were in the State in 1850, 118 cotton factories, with a capital invested of \$5,554,320, employing 3,377 males and 5,499 females, producing 59,532 yards of sheetings, etc., and 5,308,561 pounds of yarn, valued at \$5,019,323; 263 woolen factories, with a capital invested of \$3,944,090, employing 3,500 males and 2,645 females, manufacturing 7,124,600 yards of cloth, etc., valued at \$6,442,869; 28 carpet factories, employing a capital of \$802,175; 29 establishments making pig iron, with a capital invested of \$727,500, employing 994 persons, producing 23,022 tons of pig iron, etc., valued at \$1,067,572; 323 establishments, with a capital of \$4,622,482, employing 5,925 persons, and making 104,588 tons of castings, etc., valued at \$5,921,980; 60 establishments, with a capital of \$1,131,300, employing 1,037 persons, manufacturing 13,636 tons of wrought iron, valued at \$1,423,968; 1,442 flouring and grist mills; 4,599 saw mills; 942 tanneries; 550 printing offices; 458 newspapers, viz., 54 daily, 13 tri-weekly, 13 semi-weekly, 313 weekly, 13 semi-monthly, 25 monthly, and 3 quarterly publications. Capital invested in manufactures, \$99,904,405; value of manufactured articles, \$237,599,361.

The principal places in the State are New York, the metropolis, Albany, the capital, Troy, Brooklyn, Newburgh, Poughkeepsie, Hudson, Saratoga Springs, Plattsburg, Schenectady, Utica, Syracuse, Auburn, Geneva, Rochester, Buffalo, Lockport, Oswego, and Ithaca. There were, January, 1856, 32 railroads, with 2,794 miles of road finished and in operation. There is in this State the greatest extent of canal navigation within any State or country on the face of the earth, forming an aggregate of 787 miles. See CANALS and RAILROADS. There were, January, 1856, 287 banks, and 1 branch, with a paid capital of \$86,890,000.

Canals.—The canals of New York were the chief element of her early prosperity, and we give a short history of them, and their present commercial importance.

From 1814 till 1817, the subject of the canal was warmly discussed in the legislature by the friends and opponents of the internal improvement system; and the act authorizing the construction of the canal was finally passed in 1817, by a vote of 18 to 9 in the Senate. The first contract was made on the 27th of June, 1817, and the 4th of July was celebrated by breaking ground at Rome for the construction of the canal. Buffalo then had a population of less than 2,000. Notwithstanding the vast benefits conferred upon the State by De Witt Clinton in his vigorous efforts to bring about a system of internal improvements, he was removed in 1824 from the office of canal commissioner, by a vote of 21 to 3 in the Senate, and 61 to 34 in the Assembly. In 1825, a report on canals was made, written by Mr. Marcy, afterward governor, in which he said:

"From the views taken by the commissioners, it appears reasonable to indulge the hope that within the space of 10 years the canal debt may be extinguished; and this copious stream of revenue, yielding, according to the most moderate estimates, an annual income of

more than \$1,000,000, may be turned into the treasury, and the government be thereby enabled to remove from the people the burden of taxation, to diffuse the blessings of education in a more abundant manner than at present, and to carry forward this State with increasing progress, in its career of general prosperity."

In 1826, Governor Clinton congratulated the legislature on the completion of the water communication between the lakes of the West and the Atlantic Ocean, affording an "inland navigation unparalleled in the experience of mankind." It was in this year (1826) that the first act for a railroad was passed by the Legislature of New York, being the road from Albany to Schenectady, 16 miles in length. This road was not completed for several years.

In 1827, Governor Clinton called the attention of the legislature to the subject of internal improvements by the general government. The project of the Chesapeake and Ohio Canal was then before Congress, and the aid of the government was given in behalf of that then considered great work. Governor Clinton observed: "It has become a question of great moment, whether the general government has power, with or without the consent of the State governments, to construct canals and roads in their territories, and whether such power, if not already vested, ought not to be granted. * * * I think it due to a sense of duty and a spirit of frankness, to say, that my opinion is equally hostile to its possession or exercise by, or its investment in, the national authorities." See CANALS.

River and Canal Navigation.—The subjoined tables show the date of the opening and closing of the Hudson River and Erie Canal for a period of 15 years, and the number of days they were open each year.

HUDSON RIVER.

River opened.	River closed.	Days open.
1842, February 4	November 23	308
1843, April 13	December 10	242

1855, " 1	" 10	224
1856, " 8	"	

The average cost of railroads has been as follows:

	Total cost.	Per mile.
30 roads in New York.....	\$30,000,000	\$46,344
33 " Massachusetts.....	60,000,000	44,482
12 " the South and West	50,000,000	45,638

The number of railroads, including branches, now in progress in the United States, is 372. The miles in operation are 13,586; the miles in progress, 10,823; and the amount now expended is \$400,000,000—the average cost being \$80,000 per mile. The average cost of the whole 2,579 miles being about \$95,000 per mile. The amount expended on the canals of the United States is about \$150,000,000.

The New York Canals.—The Annual Report of the Canal Auditor of this State, for 1856-7, has been com-

municated to the Senate. The revenue for the past year has been greater and the expenses less than for the year 1855. The following comparative statement shows the difference in the receipts and payments between the two years :

	1855.	1856.
Tolls received.....	\$2,639,792 12	\$2,749,133 40
Payments by superintendents, and to repair-contrators.....	738,781 41	606,932 93
Payments to canal commissioners for repairs.....	82,279 82	62,473 73
Payments to collectors, weigh-masters, and inspectors.....	79,846 49	82,623 83
Refunding tolls, salaries, etc.....	58,834 40	34,693 36
	\$989,792 12	\$786,633 40

The whole amount of tolls received is.....	\$2,748,212
Which amount is composed as follows :	
Toll on boats and passengers.....	193,997
“ products of the forest.....	\$399,656
“ products of animals.....	27,947
“ vegetable food.....	1,262,599
“ other agricultural products.....	3,261
“ manufactures.....	120,462
“ merchandise.....	585,391
“ other articles.....	184,400
	2,554,215
	\$2,748,212

The whole amount of tonnage transported on the canals during the last season of navigation, ascending and descending, was.....\$4,116,082

And is composed as follows :	
Products of the forest.....	1,473,674
Products of animals.....	\$53,826
Vegetable food.....	1,163,594
Other agricultural products.....	4,953
Manufactures.....	1,192,073
Merchandise.....	284,901
Other articles.....	370,758
	789,076
	\$4,116,082

The value of such tonnage is as follows :	
Products of the forest.....	\$10,211,383
Products of animals.....	\$7,456,433
Vegetable food.....	42,596,226
Other agricultural products.....	977,794
Manufactures.....	51,030,453
Merchandise.....	10,308,419
Other articles.....	185,691,816
	11,084,991

Total.....	\$218,327,062
	Tons.

The total amount of freight, or number of tons carried one mile during the last season of navigation, was.....	592,000,603
The total movement of the several classes composing such total tonnage is as follows :	
Products of the forest.....	149,734,516
Products of animals.....	6,755,676
Vegetable food.....	250,425,916
Other agricultural products.....	936,750
Manufactures.....	258,118,341
Merchandise.....	28,409,663
Other articles.....	85,428,183
	70,318,625
Total.....	592,009,663

The whole amount of tonnage received at tide water by way of the Erie Canal from western States and Canada during the last season of navigation, was 1,212,550 tons. The whole amount of tonnage arriving at tide water, the produce of this State, during the same period, was 374,589 tons. The whole number of barrels of flour arriving at tide water through the canals, during the last season of navigation, was.....1,180,509

The whole number of bushels of wheat arriving during the same period, was 11,776,332, which turned into flour, calculating five bushels to the barrel, would make.....2,355,266

Total in barrels.....	3,485,775
-----------------------	-----------

The whole number of bushels of corn arriving at tide water during the same period, was 9,587,148. The total number of new boats registered during the last year, is 364, with a total tonnage of 38,990, making an average tonnage of 107.4.

The number of lockages at Alexander's lock, for the season, was 31,223, and the greatest number of lockages at any one lock, was 37,969, at lock No. 45, Frankfort.

Comparing the season of 1855 with that of 1856, it shows a decrease in revenue of \$66,871, and an increase

in tonnage of 93,465, divided among the different articles, as follows :

	Tons.	Tons.
Products of the forest—decreased.....	59,260	
“ animals.....	14,865	
Other agricultural products.....	525	
Merchandise.....	3,644	
	76,294	
Vegetable food—increased.....	160,729	
Manufactures.....	3,023	
Other articles.....	5,012	
	168,759	

Increase.....	93,465
---------------	--------

The increase in lockages at Alexander's lock is 350.

In flour and wheat comprised in the returns of vegetable food, there has been an increase on tonnage the past year of 112,537 tons, and an increase of tolls of \$160,694. In corn and oats there has been an increase during the same period of 28,669 tons, and an increase in tolls of \$7,691. Under the head of “Products of the forest,” there was an increase in tonnage upon shingles, boards, and scantling, as compared with 1855, of 32,163 tons, and a decreased tonnage upon timber, staves, and wood, of 97,705 tons, and an increase in pot and pearl ashes of 9,615 tons. Under the head of “Other articles,” there was an increase in the tonnage of mineral coal, for the same period, of 77,568 tons, and an increase in sundries of 15,323 tons.

Statement No. 47, appended to the report, shows the tons and description of freight carried on the New York Central and New York and Erie Railroads, ending 30th September, 1853, 1854, 1855, and 1856, and on the New York Canals during the seasons of navigation the same years.

Thus three lines of freight transit, it is well known, take all the carriage which passes through the State between New York and the Hudson River and the West, including a considerable portion of Upper Canada. It may with justice be said they are all of them competing lines of transport for what is termed “through freight,” and two of them are virtually competing lines for both through and way freight.

The ascertained results presented by these tables are interesting, and worthy of much reflection. They not only show the steady and progressive increased carriage and movement by railway, and the steady and progressive decreased carriage and movement by canal, but they also show the description of freight wherein the carriage by railroads exceeds that of the canal.

	Tons Carried.		Total.
	Railroad.	Canal.	
1853.....	991,031	4,257,853	5,248,892
1854.....	1,293,853	4,165,802	5,459,715
1855.....	1,512,121	4,022,816	5,534,788
1856.....	1,719,827	4,116,082	5,835,409

This statement shows an increase of more than 700,000 tons in 4 years by rail, and a loss of 131,771 tons to the canal in the same time.

	Total Movement.		Total.
	Railroad.	Canal.	
1853.....	156,327,872	700,389,933	856,717,805
1854.....	211,976,114	668,359,044	880,635,158
1855.....	250,279,834	619,170,651	869,450,485
1856.....	329,191,724	592,009,603	921,201,327

The total movement by railway in 1853 was not quite one fifth of that by the canals. In 1854, it was nearly one third—nearly one half in 1855, and it was quite three fifths in 1856. At this rate of progression on the part of the railroads, and of loss by the canals, the total movement of freight on those two railroads will be equal to that of the canals in about 3 years from this time, if not sooner.

The aggregate of the total movement has increased on the railroads from 1853 to 1856, 164,483,622, and the loss to the canal has been 108,380,330.

The annexed tables show why it is that with an increased tonnage in 1856 of 93,465 over 1855, the total movement should be 27,171,048 less. This increase in the number of tons carried was on short distances ;

otherwise an increase in the receipts of tolls would have been the result.

But this statement also exhibits the amount of freight earnings on these railroads, and tolls received on the canals, including the tolls on boats and passengers during the above period, together with these total movements. These comparative statements show the rapid and successful progress of the former, and the immobility of the latter:

		Freight and Tolls.	
1853.			
N.Y. Cen. R.R., tons moved 1 mile,	\$54,901,350	1,938,830

N.Y. and Erie R.R., "	183,458,046	4,545,732	
Canals, "	592,009,603	2,748,212	
Total.....	\$921,251,327	11,622,035	

This statement also shows the total tonnage of freight on these roads for 1855 and 1856 separately from other tabular calculations, from which it appears the increase on through freight in one year was 182,358 tons, and on way 14,847 tons.

The operations of these roads, for the year ending September 30, 1855, were as follows:

Roads.	Through freight.	Way freight.	Total number.	Total movement or mileage.	Tolls at canal rates in 1855.
1855.					
N. Y. & Erie..	Tons. 155,469	Tons. 636,886	Tons. 842,055	150,873,993	\$549,185
N. Y. Central..	156,194	513,879	670,073	99,605,836	487,019
Total.....	311,663	1,200,465	1,512,128	249,279,834	\$936,204
1856.					
N. Y. Central..	253,288	522,824	776,112	145,783,678	\$491,451
N. Y. & Erie..			Not reported		

The New York and Erie Railroad received on through freight in 1855, \$1,461,419 18, equal to \$9 40 per ton, on the quantity transported, and in the same year the New York Central received \$1,289,706 97 on through freight, which gives an average of \$8 25 7-10 per ton on the amount carried.

The comparative tabular statement herewith submitted is a condensed view of the total tonnage and receipts of toll on all the canals on the different descriptions of property carried, for the period of six years:

Year.	Tons carried.	Tolls received.	Av. per ton.
1851.....	3,532,738	\$3,073,992	85-86
1852.....	3,263,449	2,866,385	74-19
1853.....	4,247,858	2,955,697	69-51
1854.....	4,165,869	2,547,433	61-15
1855.....	4,022,617	2,610,430	64-39
1856.....	4,116,082	2,554,215	62-05

The receipts of toll above given are upon the property carried exclusive of the tolls on boats and passengers, and the average must be affected by the rates of toll charged and received, and the distance that property or freight is transported on the canals. The average of 1851 on the tonnage of 1856 would give \$3,542,178 of tolls. The Auditor is satisfied that the rates of toll as arranged in 1851 may be imposed on most of the property transported on the canals without any injury to trade, if the legislature will interpose its constitutional authority to protect the trade of the canals.

The canal debt of 1846, to which the annual Sinking Fund of \$1,700,000 is applicable and constitutionally pledged, was, on the 30th September, 1856, \$13,223,704 33, the annual interest of which, payable quarter yearly, amounts to \$792,193 28, and \$5,739,024 76 of this debt are for loans made upon the credit

of this Sinking Fund to supply the deficiencies which existed in that fund, to pay the debt as it fell due after 1847. Former financial officers of the State have estimated that the Sinking Funds established by article 7, section 1, of the Constitution, would be ample to meet all the charges upon them from year to year, and finally to liquidate the Canal debt, of \$16,944,815 57 outstanding on the 30th of September, 1846, in 18 years and 3 months, with a surplus of \$95,333 48 on the 1st of January, 1865, when it was assumed the whole of the debt would be paid.

CANAL DEBT.—STATEMENT SHOWING THE AMOUNT OF PRINCIPAL AND INTEREST ACTUALLY PAYABLE IN EACH YEAR, TOGETHER WITH THE RESULTS OF THE SINKING FUND, UNDER THE CONSTITUTION, ART. 7, SEC. 1, FROM SEPTEMBER 30TH, 1856; ALSO THE AMOUNT OF SURPLUS ON SEPTEMBER 30TH, OF EACH YEAR, AND THE AMOUNT OF ANNUAL INTEREST ON THE SAME AT FIVE PER CENT. PER ANNUM.

Year.	Principal payable.	Total principal and interest.	Surplus on Sept. 30th, of each year.	Interest on surplus in each year.
1856 surplus	\$1,259,901	\$62,995
1857.....	\$692,193	2,330,708	116,538

1874, Jan. 1st.....	\$19,154,180

The following statement shows the tonnage of all the canals of the State from 1850 to 1855, inclusive, the total movement in the years stated, and the total value of all the property carried on the canals in each year.

Years.	Total tonnage.	Total movement.	Total value of property carried.
1850.....	3,076,617	\$156,397,929
1851.....	2,583,733	159,981,801
1852.....	3,862,441	602,800,818	196,608,517
1853.....	4,247,858	700,889,938	207,179,570
1854.....	4,165,869	668,659,044	210,284,812
1855.....	4,022,617	619,170,651	204,890,147

The two lines of railway in the State, which, during the season of canal navigation, most effectually and seriously compete with the canals in the transport of freight, are the New York and Erie and the New York Central Railroads. The operations of these lines in the transportation of freight during the years stated below, show a steady and progressive increase.

The largest amount of tolls in any fiscal year was in 1851, when the receipts were \$3,703,999 34; and the per centage of the cost of collection on the gross amount received was \$2 03. This was before the repeal of the laws imposing tolls on freight transported on certain railroads, and the consequent reduction of tolls on the canals, to enable the State to compete for the carrying trade. In 1851 the tonnage of all the canals was 3,582,733. The tonnage of all the canals in 1855, was 4,022,617; 439,884 more than in 1851; while the tolls were only \$2,632,906 11, being \$1,071,093 23 less. The tonnage of 1855, at the rates of toll as they were fixed in 1851, would have yielded about \$4,108,000, or about \$1,536,000 more than were actually received; the very natural and perfectly legitimate results of a policy adopted by the State before it was prepared by the completion of the enlargement to encounter an active and vigorous competition.

Table below shows the amount of the new debt created since 1846, the interest of which is paid by the General Fund; the specific objects for which the several stocks were issued, and the date of redemption of each, followed by a recapitulation of the whole canal debt of the State:

CANAL DEBT.	
6's due 1st July, 1872.....	\$2,250,000
6's " 1st January, 1873.....	1,000,000
6's " 1st July, 1873.....	1,250,000
5's " 1st November, 1873.....	2,250,000
6's " 1st October, 1874.....	2,250,000
Total debt for the enlargement and completion of the canals.....	\$9,000,000
6's due 1st July, 1873.....	1,500,000
5's " 1st January, 1874, to provide for deficiencies to pay the interest and redeem the principal.....	500,000
	\$11,000,000

RECAPITULATION OF THE CANAL DEBT.

To pay the interest and redeem the principal under Article 7, Section 1, of the Constitution.....	\$13,228,704 33
To pay the interest and redeem the principal under Article 7, Section 3, of the Constitution.....	11,000,000 00
The interest paid by the General Fund.....	442,536 49

Total debt 1st January, 1857..... \$24,666,289 82

Of the debt paying interest there was held on the 30th September, 1856:

On the United States' account.....	\$18,992,289 82
On foreign account.....	3,424,000 00

Total canal debt to 30th September, 1856..... \$22,416,289 82

The interest on the debt is a fraction over 5.51 per cent.

On the 1st of July, 1853, there will be redeemed by the Sinking Fund under section one, all the five per cent. stocks then falling due, say.....	\$3,053,605 34
The new debt will probably be increased by a resort to the credit of the Sinking Fund under § 3, on the 30th September, 1853.....	813,839 44

Decrease in aggregate of canal debt..... \$2,239,765 90

If the surplus of the canal revenues during the current fiscal year shall not be sufficient to meet the whole annual contribution of \$350,000 to the General Fund Debt Sinking Fund, the deficiency should be made up from the receipts from taxes transferred to the Canal Fund during the year.

The premiums on loans constitute quite an important item of receipts to the State.

PREMIUMS ON LOANS.

The premiums received and paid into the treasury on loans made since the 1st of January, 1854, have been as stated below:

On loan of June 22, 1854, of \$1,000,000.....	\$175,706 25
" Aug. 31, " 1,250,000.....	167,246 52
" Feb. 22, 1855, of 1,000,000.....	131,380 00
" June 21, " 1,250,000.....	234,500 00
" June 20, " 1,500,000 C. R. O.....	259,405 00
" Oct. 24, " 1,250,000.....	204,511 50
On loans to supply deficiencies in Sinking Funds, December 13, 1855 (5 per cent.).....	4,500,000
On E. and C. loan, March 25, 1856.....	1,000,000
	170 709 00
Aggregate to September 30, 1856.....	\$1,375,439 52
On the 18th October, 1856, a loan of \$1,250,000 for E. and C. was made at a premium of.....	171,336 50
Total of premiums.....	\$1,546,826 02

OF THE COST FOR ENLARGEMENT AND COMPLETION.

The late State Engineer and Surveyor, Hon. John T. Clark, in his report to the Legislature in 1853, estimated the cost of completing all the canals, after the 31st of December, 1853, including 10 per cent. for contingencies, the cost of engineering and land damages, at.....	\$13,131,503 74
To this cost he applied the constitutional loans, under § 3, article 7.....	9,000,000 00
And estimated a deficiency of.....	\$4,131,503 74
which is a pretty large addition to any estimate here-	

before given by the engineers of the total cost of enlargement and completion.

Trade and Tonnage of the Canals.—From the tables furnished the Auditor of the Canal Department we compile the annexed statement of the trade and tonnage of the canals for the year 1856. The tables, obtained from the same source, of the movement for the years 1854 and 1855, are also published, for the purpose of giving a comparison in both value and quantity with the business of 1856. The statement will be found of much interest.

It will be found that in the products of the forest the Report of 1856, compared with that of 1855, presents an increase in the articles of furs and peltry, timber and ashes, while in the other articles there is a large decrease, both in value and quantity. Comparing the same products with those of 1854, the increase is in the articles of furs, shingles, and ashes, both as to value and quantity.

Under the head of agriculture the receipts of 1856 show a large increase in some important articles, such as pork, wheat, rye, corn meal, barley, oats, peas and beans, potatoes, dried fruit and hops. In other articles, under the same head, there is a large deficiency; such as beef, bacon, cheese, butter, wool, lard, etc. The products under the same head, compared with those of 1854, show a different exhibit from those of 1855. There is a large deficiency in pork, beef, bacon, lard, wool, corn, corn meal, and clover seed; while in the articles of cheese, butter, hides, wheat, rye, barley, oats, bran, and ship-stuff, peas and beans, potatoes, dried fruit, and flax seed, there is an increase.

The first constitution of New York was adopted by the Provincial Congress, April 20th, 1777, was ratified by the State Legislature July 26th, 1788, and was somewhat amended in 1801. On the third Tuesday of June, 1821, a convention called by the Legislature met at Albany, and having made a revision of the constitution, the same was ratified by the people in December following. The third and present constitution was adopted in convention at Albany, October 9th, 1846, was ratified by the people on the ensuing 2d November, and went into operation January 1, 1847. Among the provisions of the existing constitution are these:—A sinking fund to pay the State Canal Debt shall be thus formed: from the surplus revenues of the State canals from June 1, 1846, to June 1, 1855, \$1,300,000, annually; from June 1, 1855, thenceforward, \$1,700,000, annually, including \$300,000 then to be borrowed until the debt is wholly paid. After thus appropriating there shall be annually set apart \$350,000 out of the surplus canal revenues from June 1, 1846, until the canal debt is paid; and after said payment, then \$1,500,000 annually, which appropriations shall form a sinking fund to pay the general fund debt of the State. After thus appropriating, \$200,000 or less shall be annually paid from the surplus canal revenues to the State treasury for general State expenses. And the remainder of the surplus canal revenues shall be applied to the completion of the canals. If the above sinking funds are insufficient to satisfy the creditors of the State, equitable taxes shall be laid. * * * The credit of the State shall not be loaned to any individual corporation. To meet casual deficits, the State may contract debts not exceeding \$1,000,000. Other debts may be contracted if submitted by the Legislature to the people, with provisions for payment by direct taxation, and ratified by the people. * * * Corporations are to be formed under general laws, except those for municipal purposes. Municipal corporations are to be restricted by the Legislature in their power of taxation and contracting debts. Stockholders in banks are individually responsible for the debts of their corporation to the amount of their shares of stock. * * The capitals of the common school literature and United States deposit funds are inviolate.

The aggregate statement shows an increase in the down tonnage in 1856 over 1855 of 200,844 tons, and a decrease in value of \$2,674,537.

In respect to the upward movement, there is an increase of tonnage in 1856 over 1855 of 115,846 tons, and in value of \$80,687,844.

STATEMENT SHOWING THE TOTAL QUANTITY AND ESTIMATED VALUE OF EACH ARTICLE WHICH CAME TO THE HUDSON RIVER ON ALL THE CANALS, DURING THE YEARS 1854, 1855, AND 1856.

HOMANS Foreign Commerce of the United States.

For New York Canals, see *North Am. Rev.*, xiv., 230, xxix., 500, xi., 129, xiv., 543. For Trade, Commerce, Debts, etc., of New York, see *HUNT'S Mer. Mag.*, xviii., 243, xxiii., 610, xxiv., xxv. (by A. C. FLAGG); *Banker's Magazine*, vii., viii., ix., x., xi. Mineral Resources, see *N. Y. Rev.*, iv., 71, v., 477, viii., 103; *Am. Jo. Science*, xxxix., 95, xli., 73, xlii., 227, xlv., 143, xlviii., 296, i. (N. S.), 43, iii., 57, 164.

As our limits prevent our giving full statistics of many important elements of commerce, we refer to these subjects under their proper heads. For particular information, see articles EMIGRATION, TONNAGE, NEW YORK CITY, BANKING, COMMERCE, TARIFF, SHIPPING, RAILROADS, CANALS, and UNITED STATES.

New York, the capital of the State of that name, and the commercial metropolis of the United States, on the southern extremity of Manhattan Island, at the point of confluence of the Hudson River, which separates Manhattan from New Jersey, with East River, which separates it from Long Island, in lat. 40° 42' N., and long. 74° 8' W. New York Bay, or inner harbor, is one of the most capacious and finest in the world; it is completely land-locked, and affords the best anchorage. The entrance to the bay through the Narrows is extremely beautiful. On each side, the shore, though wooded down to the water's edge, is thickly studded with farms, villages, and country seats. At the upper end are seen the spires of the city; and in the distance the bold precipitous banks of the Hudson. From New York to the bar between Sandy Hook Point and Schreyer's Island (the division between the outer bay or harbor and the Atlantic) is about 17 miles. Fortifications have been erected at the Narrows, Governor's Island, and other places, for the defense of the city and shipping.

Manhattan was first discovered and explored by Hendrick Hudson in 1609. Hudson ascended the

river which now bears his name as far as the present site of Albany. The ship in which he made the voyage from Holland was of about 80 tons burden, and called the *Half Moon*. In 1610 a ship was sent by the Amsterdam merchants to trade with Indians for furs, etc. In 1613 a small fort was erected, and four houses were built, under the superintendence of Hendrick Corstiaensen, who explored the bay and the several inlets, creeks, etc. But no permanent settlement seems to have been made until about 1625, on the south point of the island. After the formation of the Dutch West India Company, they took immediate measures for establishing a permanent colony. Under their fostering care, bonwerries, or farms, were soon taken up, a substantial fort erected, and the dwellings of the colonists clustered around it. In 1652 it was incorporated under the name of New Amsterdam, and was governed by 2 burgomasters, 5 schepens, and a schout or sheriff, and continued in their possession until 1664, when it was taken by the English, and the name changed to New York. In 1673 it was retaken by the Dutch, and called New Orange, but they held possession only one year, when it was again occupied by the English, and continued in their possession until the period of the Revolution. The assessors' valuation of property in the city, in 1688, was about \$320,000. In 1690 a congress of the commissioners of the several colonies was held at New York. In 1694 there were 60 ships, 25 sloops, and 40 boats, belonging to the city. In 1696 Trinity Church was built. This building was burned in 1776. In 1725 the first newspaper was published in this State.

In 1699 it contained 6000 inhabitants. In 1774, previously to the commencement of the War of Independence, the population amounted to 22,750. During the war the population continued stationary; but since 1783 its increase had been quite extraordinary. In 1790 the population amounted to 33,131; in 1800, to 60,489; in 1820, to 123,706; in 1830, to above 213,000;

in 1840, to 812,710; and in 1850, to 515,507. This, however, is exclusive of the population of Brooklyn, which, in 1850, amounted to 96,838, and is as much a part of New York as Birkenhead is of Liverpool. Originally the houses were mostly of wood, and the streets narrow and confined. In these particulars, however, a vast improvement has taken place during the last half century; most part of the old houses having been pulled down and rebuilt with brick. The new streets, which are broad, and intersect each other at right angles, are well paved and lighted. Broadway, the principal street, is one of the largest and finest in the world. Many of the public buildings are commodious and elegant. The pools, that were formerly abundant in the city and its vicinity, have been completely filled up; a measure that has done much to improve the health of the population. In respect of cleanliness, however, New York, though much improved, is still rather deficient. Formerly there was hardly such a thing as a sink or common sewer in the whole city; the night soil and filth were collected in the pits, of which there was one in every house, and being conveyed to the nearest quays, were thrown into the water; and as these were made of timber, with many projections, a great deal of filth was retained about them, producing, in hot weather, an abominable stench. But in these respects a great amendment has been effected; and the deficiency of water, under which the city formerly labored, has been completely obviated by the construction of the Croton Aqueduct, about 40½ miles in length, a work worthy of being ranked with the noblest of the old Roman aqueducts.

New York is indebted, for her wonderful increase, to her admirable situation, which has rendered her the greatest emporium of the New World. The rise of the tide is about 6 feet, and even at ebb there are 21 feet water on the bar; and the water in the outer and inner bays, and in the river, is so deep that ships of the largest burden lie close to the quays, and may proceed to a great distance up the river. The navigation of the bay is rarely impeded by ice. The great strength of the tide, and the vicinity of the ocean, keep it generally open, even when the Chesapeake and Delaware Bays are frozen over. The influence of the tides is felt in the Hudson as far as Troy, 160 miles above New York, affording peculiar facilities for its navigation. Those natural advantages have been vastly extended by a system of canals, which has connected the Hudson not merely with Lake Ontario and Lake Erie, but with the Ohio River, and consequently with the Mississippi and the Gulf of Mexico! So prodigious a command of internal navigation is not enjoyed by any other city, with the exception of New Orleans; but the readier access to the port of New York, the great salubrity of the climate, and her situation, will secure her hereafter the preponderance.

New York Harbor.—In April, 1857, Professor Bache, of the United States' Coast Survey, furnished the Life Saving Association with his *Sailing Directions for Sandy Hook and its Approaches from Sea*, of which 5000 copies have been printed in pamphlet form. A portion of these has been placed in the hands of the dealers in nautical instruments in the following ports for gratuitous distribution to captains of vessels, namely, New York, Portland, Me., Portsmouth, N. H., Boston, Mass., Philadelphia, Baltimore, Savannah, Mobile, New Orleans, Norfolk, Charleston, and a supply of these pamphlets, for the like purpose, has been forwarded to the United States' consuls in Cork, Dublin, Belfast, Bristol, Cardiff, Hull, Sunderland, Portsmouth, Southampton, Glasgow, Dundee, Liverpool, London, Havre, Marseilles, Antwerp, Bremen, Hamburg, Amsterdam, Rotterdam, and Havana.

Range Lights from East End of Gedney's Channel, between Sandy Hook and Flynn's Knoll.—Two fixed lights located near Point Comfort, New Jersey. The front

light will be exhibited from a lantern on the keeper's dwelling, which is located near the beach, and painted white, with the top of the lantern black. The rear light is located three quarters of a mile distant from the front one, and will be exhibited from a tower painted white, with the head of it and lantern black. The keeper's dwelling is north of it and painted white. The front light is 40, and the rear one 76 feet above the mean level of the sea, and should be seen, under ordinary state of the atmosphere, outside the bar. During the day the front building can be readily recognized from other buildings in the vicinity by the lantern on its centre, and the rear one by the lantern of the tower being projected on the sky above the trees.

Main Ship Channel Range Lights.—Two fixed lights located on the New Jersey shore, west of Highlands of Navesink. The front light will be exhibited from a tower near the beach, painted with 2 white and 1 red horizontal bands, and the roof of the lantern also of the latter color. The keeper's dwelling is west of the tower, and painted white. The rear light is located on the north side of Chappel Hill, 1½ miles distant from the front light, and will be exhibited from a lantern on the keeper's dwelling. The dwelling is painted white, and the top of the lantern red. The front light is 60, and the rear one 224 feet above the mean level of the sea, and both should be seen, under ordinary state of the atmosphere, the length of the range line. During the day they can be readily recognized by the shape and colors of the towers of the front light, and by the lantern of the keeper's dwelling, and isolated portions of the rear one. It is about 1 mile east of Pigeon Hill.

Swash Channel Range Lights.—Two fixed lights located on Staten Island, New York. The front light will be exhibited from a tower near the site of the "Old Elm Tree" Beacon, painted with 2 white and 1 red horizontal bands, and the roof of the lantern also of the latter color. The keeper's dwelling is south of the tower, and painted white. The rear light is located on a hill, near New Dorp, about 1½ miles from the front light, and will be exhibited from a lantern on the keeper's dwelling. The dwelling is painted white, and the top of the lantern red. The front light is 59 feet, and the rear light 189 feet above the mean level of the sea; and both should be seen, under ordinary state of the atmosphere, well outside of the bar at Sandy Hook. During the day they can be readily recognized by the shape of the tower, and colors of the front light, and by the lantern on the dwelling, and isolated position of the rear one.

Sailing Directions.—Masters of vessels intending to enter by Gedney's Channel around the south-west Spit Buoy, should run on a north-west half west course from the light-vessel for the black and white perpendicular-striped Nun Buoy at the outside of Gedney's Channel, and from it west by north through the channel, keeping between the buoys, until the range lights near Point Comfort, New Jersey, are in one, when haul up for them, and continue upon the range until the two main channel lights are brought in range, which will also be shown by the main light at Sandy Hook, being a little open to the southward of the West Beacon. From this point the Main Ship Channel range will take them up clear of the "West Bank" and Craven's Shoal. Masters of vessels intending to pass through the Swash Channel, can bring the lights in range outside the bar, and run for them, until the Red Can Buoy, No. 8 (which marks the upper middle), is passed, or until the Main Ship Channel range is on, when haul up on that range until clear of the "West Bank." Vessels drawing more than 17 feet should not be taken through this channel on the range line at low water. A foot more water may be carried through this channel, after crossing the bar, by keeping a little to starboard, and opening the front light

clear of the rear one. The Swash Channel range line indicates, by the most recent survey, 18 feet at low water.

There are 57 banks in the city of New York, with an aggregate capital of \$60,000,000, 8 marine insurance companies, and 60 fire insurance companies, with an aggregate capital of \$20,000,000; besides 8 life insurance companies. There are 16 savings' banks, and 15 markets.

COMPARATIVE VALUE OF REAL AND PERSONAL ESTATE OF THE CITY AND COUNTY OF NEW YORK, AND AMOUNTS RAISED BY TAX, FROM THE YEAR 1844 TO 1856.

Year.	Real estate.	Personal estate.	Taxes.

The Croton aqueduct commences at the Croton River, 5 miles from the Hudson, in Westchester county. The dam is 250 feet long, 70 feet wide at the bottom, and 7 at the top, and 40 feet high, built of stone and cement. It creates a pond 5 miles long, covering a surface of 400 acres, and containing 500,000,000 gallons of water. From the dam the aqueduct proceeds; sometimes tunneling through solid rocks, crossing valleys by embankments, and brooks by culverts, until it reaches Harlem River, a distance of 33 miles. It is built of stone, brick, and cement, arched over and under, 6 feet 3 inches wide at bottom, 7 feet 8 inches at top of the side walls, and 8 feet 5 inches high; has a descent of 13½ inches per mile, and will discharge 60,000,000 of gallons every 24 hours. It crosses the Harlem River on a magnificent bridge of stone, 1450 feet long, with 14 piers; 8 of them bearing arches of 80 feet span, and 7 others of 50 feet span, 114 feet above tide-water at the top. The receiving reservoir at Eighty-sixth-street, 38 miles from the Croton dam, covers 35 acres, and holds 150,000,000 of gallons. The distributing reservoir, on Murray's Hill, at Fortieth-street, covers 4 acres, and is constructed of stone and cement, 45 feet high above the street, and holds 20,000,000 of gallons. Thence the water is distributed over the city in iron pipes, laid so deep under ground

as to be secure from frost. The whole cost of the work has been about \$13,000,000. The water is of the purest kind of river water. There are laid below the distributing reservoir in Fortieth-street, more than 200 miles of pipe, from 6 to 36 inches in diameter. See **AQUEDUCTS**. There are not more than four cities in Europe larger than New York, viz., London, Paris, Constantinople, and St. Petersburg.

The heavy warehousing of goods during the past three months, to secure the benefit of the new tariff, will not escape observation. The import of merchandise is more than \$3,000,000 less than in the corresponding three months of 1856, but a nearly equal total import is made up of specie and bullion.

The annexed statement exhibits the value of certain articles imported into and exported from this port during the year 1856, compared with 1855:

COMMERCE OF THE PORT OF NEW YORK.
VALUE OF IMPORTS AND EXPORTS.

	1855.	1856.

EXPORTS FROM NEW YORK TO FOREIGN PORTS, FOR THE LAST QUARTER OF THE FISCAL YEARS ENDING JUNE 30TH, 1855, 1856, AND 1857.

	1855.	1856.	1857.
Domestic merchandise.....	\$13,378,540	\$19,066,095	\$16,584,115
Foreign mdsce., dutiable.....	1,857,362	899,588	1,121,531
" " free.....	892,028	284,668	927,770
Total merchandise.....	\$15,627,930	\$20,250,346	\$18,633,416
Specie.....	12,495,692	8,236,279	17,083,425
Total.....	\$28,123,622	\$28,986,619	\$35,716,841

The figures above given for the last three months, although presenting many points of comparison with the same time in 1856, show little or nothing more, in comparison with those of 1855, than a steady increase, except perhaps, in specie, in which the increase is relatively large.

VALUE OF ARTICLES OF MERCHANDISE, OF DOMESTIC GROWTH AND MANUFACTURE, EXPORTED FROM NEW YORK, IN THE YEAR ENDING DECEMBER 31, 1855.

Wheat.....bush.	8,455,284	6,952,398
Whisky.....gals.	55,826	86,514
Total.....		\$53,756,387

Large as was the export of specie for the fiscal year, it is less than \$9,000,000 in excess of 1854-55. The export of domestic produce is a trifle larger than last year, with prices averaging about the same—cotton and provisions being higher, and breadstuffs lower.

IMPORTS INTO THE PORT OF NEW YORK FROM FOREIGN PORTS FOR THE SEVERAL MONTHS OF THE FISCAL YEAR ENDING
JUNE 30, 1857.

Months.	Dutiable goods.	Free goods.	Total for consumption.	Ware-housed.	Total mdse. entered.	Specie and bullion.	Total import.	Withdrawn from warehouse.	Total put on market.

Total, 1856-57.	\$141,380,083	\$16,018,530	\$157,348,613	\$62,379,159	\$219,727,772	\$6,441,848	\$226,169,120	\$27,950,070	\$185,298,638
" 1855-56.	150,088,122	17,432,102	167,520,224	29,508,426	197,028,650	1,126,097	198,154,747	21,994,180	189,454,354
" 1854-55.	107,029,210	14,230,259	121,259,469	32,022,396	153,281,856	1,153,661	154,505,526	23,501,421	144,860,887
" 1853-54.	147,929,241	12,791,055	160,720,296	27,417,160	188,137,456	2,937,048	191,074,504	19,876,445	180,596,741

It will be seen from the above that the value of goods put upon the market falls short of the total value of the import of merchandise, about \$34,500,000, and we have good reason to set down the value of goods in bond July 1, 1856, at \$10,000,000 at least, making the total value of goods in bond July 1, 1857, about \$45,000,000, which is \$6,000,000 or \$7,000,000 greater than was to have been expected from such reports as we have had from time to time. We must not forget to place to the credit of the year, an importation of specie and bullion of \$6,500,000 against a little more than \$1,000,000 the previous year. The total import of merchandise is \$22,000,000 in excess of the previous year, and it is not a flattering fact, that we have been importing most freely, when it was evident that stocks were accumulating. The merchant can not devote a few hours more profitably, than in a careful scrutiny of the above tables.

The extent to which goods have been warehoused, caused the cash receipts at the custom-house to fall below those of last year, as is shown in the following: CASH DUTIES RECEIVED AT THIS PORT DURING THE FISCAL YEAR ENDING JUNE 30TH, 1857, COMPARED WITH THE TWO PREVIOUS YEARS.

Months.	1854-55.	1855-56.	1856-57.

The final result of this expansion, if continued, will be the loss of credit, and, as a consequence, a reduction—not, however, until we shall have endured all the penalties incident to bankruptcy. With the realization of the present prospect, good crops, and the continued development of the manufactures of our country, we can expect prosperity, if we can only avoid the evil of excessive consumption, and, as a consequence, importation of foreign manufactures. We have prepared a statement showing the exports of France, Great Britain, and the United States for a period extending from 1847 to 1856, inclusive. This statement enables us to compare the increase in exports, and consequently in wealth, of the three principal maritime countries in the world. With regard to the increase of wealth, a country is in a similar position to an individual. The exports of one are equivalent to the income of the other; and the imports of one, on the other hand, are equivalent to the expenses of the other. In the case of this country, the *ad valorem* tariff prevents us from obtaining a correct valuation of the imports, in order to obtain the exact difference, or, in other words, the increase of wealth,

through the foreign commerce of the country. We may, however, judge in a measure from the *character* of the imports of the probable gain of wealth. If they are luxuries instead of necessities, or manufactures that could be home-made, instead of the products foreign to our soil and climate, we may justly put that nation down on the extravagant list. And this is the position of the United States. In the period of 10 years below given, the increase of exports to the United States has been equal to 107 per cent.; the increase of imports has been (for the same period) equal to 114 per cent. Showing that even with our enormous productive powers, and the great wants of Europe, our exports have not kept pace with our demand for luxuries. We are apt to congratulate ourselves on the unequalled growth of our country, and its commerce. Of the former we have reason; but of the latter, the figures do not prove our statements. In the last 10 years the exports of the United States have increased 107 per cent, while the increase in the exports of France for the same period is equal to 130 per cent.; and the increase in the exports of Great Britain for the same period is equal to 93 per cent.

Statement showing, separately, the total exports of domestic produce of France, Great Britain, and the United States for the past 10 years:

Year.	France.	Great Britain.	United States.
1847	\$140,000,000	\$293,000,000	\$158,000,000
1848	135,000,000	263,000,000	154,000,000
1849	135,000,000	315,000,000	145,000,000
1850	211,000,000	359,000,000	152,000,000
1851	233,000,000	370,000,000	218,000,000
1852	305,000,000	393,000,000	210,000,000
1853	245,000,000	493,000,000	281,000,000
1854	280,000,000	453,000,000	273,000,000
1855	308,000,000	475,000,000	275,000,000
1856	325,000,000*	575,000,000	326,000,000

* Estimated.

The exports of a country are the best exponent of its commercial prosperity, and in a measure it is in a direct ratio. For although the profit which is made on the articles exported may vary according as they are the natural products of the soil, or manufactures, the raw material of which is the growth of another country, yet there are other allowances to be made which compensate for this difference. It is evident, therefore, that any financial troubles we may have must be the result of our extravagant imports. These we have shown to have increased more rapidly than our exports, even with the valuation of our imports by an *ad valorem* tariff. The correction to be applied, if we wish to continue prosperous, is self-evident; and this correction will, under our present course, become ere long a necessity. A nation's balance-sheet is equivalent to the relation of receipts and expenditures with an individual; and national bankruptcy will surely follow when the imports, for a long series of years, are greater than the exports.

The exports of domestic cottons from the port of New York to foreign ports, for three years past, has been as follows:

Exported to.	1854. Packages.	1855. Packages.	1856. Packages.

Maritime Advancement.—We doubt whether the progress of this country as a maritime power, and of this city as a commercial emporium, can be more clearly demonstrated than in the subjoined simple tables; the first showing the tonnage of the shipping that entered this port from foreign ports, for a number of years, commencing with 1821:

Years.	Home.	Foreign.	Total Tonnage.
1821.....	\$155,798	\$16,240	\$171,968
1825.....	259,525	20,655	280,180
1830.....	255,691	25,821	281,512
1835.....	373,465	90,999	464,464
1840.....	409,458	118,186	527,598
1845.....	472,492	140,858	613,350
1846.....	496,761	185,404	682,165
1847.....	605,433	833,537	939,020
1848.....	657,795	867,821	1,025,116
1849.....	734,009	414,096	1,148,105
1850.....	807,580	441,757	1,249,337
1851.....	1,144,485	479,569	1,624,052
1852.....	1,231,951	478,087	1,709,988
1853.....	1,821,674	491,581	1,813,255
1854.....	1,442,278	477,085	1,919,313
1855.....	1,810,257	202,000	1,512,257

The increase in the total tonnage from 1821 to 1851, thirty years, was nearly ten-fold. The increase in American tonnage during the same period, was more than seven-fold. The increase in foreign tonnage was nearly thirty-fold—about 2,900 per cent. This explains, more clearly than any other fact, the cause of the growing interest felt by European governments in the affairs of this country. The great falling off in the foreign tonnage in 1854, in comparison with several years immediately preceding, was doubtless mainly in consequence of the Eastern war, which employed, not only the Cunard steamers running to this port, but a vast amount of British shipping of all descriptions, as

We give two tables, arranged from the report on Commerce and Navigation, showing the complete commerce of the port of New York, and specifying the destination of all vessels when outward bound, or the country from whence they arrived when inward bound; also showing their nationality. This table enables us to see at a glance the distribution of the commerce of New York, and gives a clear exhibit of our relations to other countries in regard to favorable or unfavorable tariffs, and shows some very curious statistics. In our trade to England, four fifths of the tonnage belongs to the United States, showing that we have a fair field for enterprise; while to the

transports. The inactivity in freights hence was also potent in influence. There is no reason to doubt that, with the return of peace, the foreign shipping entering this port yearly, will equal, if not surpass in tonnage, any former year.

The above table shows only the extent of the trade of this city with foreign ports. The coasting trade since 1847 is shown, partially, in the following. But it must be remembered, that coasting vessels to or from ports north of the northern boundary of Georgia, are not compelled to enter or clear, unless distilled spirits are of the cargo. It will at once be seen that this exhibit of the trade of this city coastwise is far from being complete. The same fact will also explain the disparity between the tonnage entered and cleared:

Years.	Entered.	Cleared.
1848.....	402,143	805,993
1849.....	424,976	895,589
1850.....	489,396	1,020,070
1851.....	455,542	1,214,922
1852.....	497,540	1,378,762
1853.....	507,531	1,310,697
1854.....	543,432	1,499,968
1855.....	614,045	1,378,889

But the increase in tonnage is not alone remarkable. It is a common observation that the largest ships of 20 years ago did not exceed in tonnage the ordinary coasters of the present day. Then, a ship of 700 or 800 tons was a wonderful achievement of capital and mechanism. Now, ships of more than 2,000 tons have ceased to be regarded as out of the ordinary course. The following is a statement of the number of vessels, foreign and American, that entered this port in the years indicated, their total and average tonnage. The statement of the entries for 1855, shows a diminution in the average tonnage of foreign vessels, to below that of 1840; which makes it quite clear that the diminished tonnage of the year was, as we have said, caused mainly by the use of a great number of large ships for purposes incident to the war between the Allies and Russia. From 1835 to 1854, the American tonnage increased about four-fold, but the number of ships increased only about 70 per cent., the average tonnage about 117 per cent., exceeding the average foreign tonnage about 60 per cent.

Years.	American.			Foreign.		
	No. of vessels.	Total tonnage.	Average tonnage.	No. of vessels.	Total tonnage.	Average tonnage.
1835.....	1,544	373,465	245	471	90,999	193
1840.....	1,447	409,458	280	470	118,186	253
1845.....	1,484	472,492	319	526	140,858	267
1850.....	1,892	807,580	427	1,451	441,757	304
1854.....	2,636	1,442,278	547	1,411	477,085	333
1855.....	2,437	1,310,257	527	904	202,000	228

British North American possessions we have less than one fourth, showing that we are inferior in enterprise to our neighbors, or they have some tariff advantage. We absorb four fifths of the carrying trade to France, while to the northern European countries we have but an equal amount. The carrying trade to South America goes almost entirely in American bottoms. The Cuba trade is 95 per cent. in American vessels, while to Portugal only about one third; showing that the tariff is in favor of that country. To Hamburg we have less than one fifth; which is probably owing partly to more economy practiced by the Dutch, and lower wages.

The greater increase of the commerce of New York over the other cities, is shown by the tables from the annual report on commerce and navigation. The tonnage built during the year ending June 30, 1856, in all the States, was 469,393 tons, the leading States ranging as follows:

States.	Ships.	Brigs.	Schooners.	Sloop and canal boats.	Steamers.	Total.	Tons.
Maine.....	156	70	84	4	4	316	149,907-88
Massachusetts.	84	10	85	1	4	184	90,884-88
New York.....	24	7	87	161	27	306	76,301-12
All others.....	88	17	843	313	186	947	162,361-00
Total.....	306	103	549	479	221	1,703	469,393-78

Maine, it appears from this, builds an amount of tonnage nearly as large as Massachusetts and New York together, and also nearly as large an amount as all the other States of the Union, omitting Massachusetts and New York; so that there is built on the coast of Maine almost one third of the aggregate tonnage of the Union. Probably, leaving out of view steamships, canal boats, and river craft, Maine builds fully one half of the tonnage of the Union.

Taking the leading ship-owning States, we have the following result as to tonnage owned:

	June 30, 1856.	June 30, 1855.	Tons.
New York.....	1,508,808	1,464,216	Inc. 44,587
Massachusetts..	891,860	979,205	Dec. 87,345
Maine.....	780,170	806,599	Dec. 26,429
Total.....	3,180,838	3,250,020	
		8,180,338	

Decrease in the year 1855..... 69,637

The following table shows the relative amount of tonnage owned in the large ports which have over 50,000 tons registered at the custom-house of the district:

Ports.	June 30, 1856.	June 30, 1855.
	Tons.	Tons.
New York.....	1,223,096	1,223,234
Boston.....	521,117	546,263
Philadelphia...	197,228	294,806
Baltimore.....	158,344	183,108
Bath.....	193,320	175,258
New Orleans...	163,308	200,536
Waldoborough..	155,873	148,896
New Bedford...	153,000	169,986
Portland.....	136,154	137,317
Buffalo.....	98,929	76,952
Chicago.....	67,407	50,972
Cleveland.....	59,919	51,578
Detroit.....	58,688	65,058
Belfast.....	70,162	70,762
Barnstable.....	63,136	80,615
Charleston.....	59,128	56,419
San Francisco..	80,750	87,842
Cuyahoga.....	60,916

The most remarkable decline is that shown in Philadelphia. New York exhibits the greatest increase of tonnage, according to these returns.

Of tonnage employed in steam navigation, New York stands at the head by a large amount. The figures are as follows:

	Tons.
New York State.....	155,736
New Orleans.....	51,751
St. Louis.....	83,745
Pittsburg.....	87,505

RATES OF COMMISSIONS RECOMMENDED BY THE CHAMBER OF COMMERCE, TO BE CHARGED WHERE NO EXPRESS AGREEMENT TO THE CONTRARY EXISTS.

On giving bonds for vessels under attachment in litigated cases, on amount of liability..... 2½ "

The foregoing commissions to be exclusive of brokerage, and every charge actually incurred.

Nicaragua, San Juan de. A sea-port town at the mouth of the river of the same name, State of Costa Rica, on the west shore of the Caribbean Sea, lat. 10° 55' N., long. 83° 43' W. The port is excellent, and is considered the best on this part of the coast. Till lately, the town was quite inconsiderable, and consisted of little else than a cluster of huts; but latterly it has no doubt been improved.

This place has risen into importance from its being at the western extremity of a proposed line of water communication between the Caribbean Sea and the Pacific Ocean. This line is to consist partly of the River San Juan, flowing from the Lake of Nicaragua east to the sea at San Juan, partly of the lake, and partly of a canal to be constructed from the latter to the Pacific Ocean. This project has been often mooted; but the discovery of the extraordinary mineral riches of California, and the consequent emigration to and intercourse with that country, have given it an incomparably greater interest than it formerly possessed. The country appears to present greater facilities for effecting this great work, than any other part of Central America, except the Isthmus of Darien or Panama. The River San Juan, about 90 miles in length, is said to have been occasionally navigable throughout its entire course for sea-going vessels, till the Spaniards, to protect themselves from the attacks of the buccaneers, sunk vessels loaded with stone in its bed. In consequence of the interruption thus given to the stream, a considerable portion of the water was carried off by a new channel called the Rio Colorado.—CHEVALIER, *L'Isthme de Panama*, etc., p. 84. The San Juan is still, however, navigated, though with much difficulty, in the rainy season, by steamers and other vessels drawing little water.

The lake itself has deep water throughout, and is adapted for ships of the largest burden. The distance between its south-western shore and the Gulf of Papagayo, on the Pacific, is only 29,880 yards, or 15½ miles; and though the intervening country be laid down in many maps as mountainous, the greatest actual height of any part of it above the level of the lake is only 19 feet; at least, such is the result given by a series of 347 levels, about 100 yards apart, taken in 1781.—THOMPSON'S *Guatemala*, *Append.*, pp. 512-520. The surface of the lake is 128 feet 3 inches (English) above the level of the Pacific; an ascent which might be overcome by a succession of locks. The difference in the level of the two oceans, formerly supposed to be so serious an obstacle to the undertaking, is said by Humboldt not to exceed 20, or, at most, 22 feet. (*Nouv. Espagne*, i., 223, ed. 1825.) At its western extremity,

the Lake of Nicaragua is connected by a small river, the Tipitapa, with the Lake of Leon or Managua. The latter, 55 miles in length by nearly 80 in breadth, is also said to have deep water throughout. And the plan which appears to be at present preferred is, to make the channel uniting these two lakes navigable, and to excavate a canal from the latter to the port of Realejo, on the Pacific. Mr. Squier, late *chargé des affaires* of the United States at Nicaragua, has published the following statements in regard to this route.

Length of the route by Lake Nicaragua, etc., across the American Continent, from the Atlantic to the Pacific Oceans: River San Juan, 90 miles; Lake Nicaragua, necessary to be traversed, 110 miles; River Tipitapa, 18 miles; Lake Managua or Leon, 55 miles; from Lake Managua to Realejo, 40 miles; total, 303 miles. Height of the various lakes to be passed, and the elevations of land: height of Lake Licaragua, 147 feet 9 inches above Atlantic, 128 feet 3 inches above Pacific; height of Lake Managua, 176 feet 5 inches above Atlantic, 156 feet 11 inches above Pacific; highest point of land to be passed, 231 feet 11 inches above Atlantic, 212 feet 5 inches above Pacific.

The River San Juan reaches the ocean by several mouths. The divergence takes place about 20 miles from the sea, forming a low delta, penetrated by numerous canals, or, as they are called on the lower Mississippi, *bayous*, and *lagunas*. The principal branch is the Colorado, which carries off at least two thirds of the water of the river, and which empties into the ocean some 10 or 15 miles to the southward of the port. There is an almost impassable bar at the entrance, which would preclude the ascent of vessels, even if the depth of water above permitted of their proceeding after it was passed. The little steamer *Orus*, nevertheless, after repeated trials, succeeded in passing. There is another small channel called the *Tauvo*, which reaches the sea midway between the port and the mouth of the Colorado. The branch emptying into the harbor, the one through which the ascending and descending boats pass, carries off only about one third of the water of the river. It, too, has a bar at the mouth, *i. e.*, at its point of debouchure into the harbor, upon which, at low tide, there are but three or four feet of water. This passed, the bed of the river is wide, and studded with low islands; but excepting in the channel, which is narrow and crooked, the water is very shallow. It has been suggested that the Colorado branch might be dammed, and a greater column of water thrown into the other, or San Juan branch. But the suggestion can only be made by those who are wholly unacquainted with the subject. Allowing it to be possible to build a dam, the stream would probably find a new channel to the sea; or, if it took the direction of the harbor, fill it up during the first rainy season with sand, or at once destroy the sandy barriers which now protect and form it. It can not be made navigable for ships or vessels of any kind, except of the lightest draught, by any practicable system of improvements. The boats used upon the river for carrying freight and passengers are exaggerated canoes, called *bongos*. Some are hollowed from a single tree, but the better varieties are built, with some degree of skill, from the timber of the *cedro*, a very light and durable kind of wood, which grows abundantly about the lakes. The largest of these carry from 8 to 10 tons, and draw 2 or 3 feet of water when loaded. They are long, and rather deep and narrow, and have, when fully manned, from 8 to 12 oarsmen, who drive the boats by means of long sweeps and setting-poles. Sails are seldom, if ever, used, except upon the lake. The masts are unshipped and left at the head of the river in descending, and resumed again in returning. These boats have a small space near the stern called the "*chopa*," covered with a board roof, a thatch of palm leaves, or with hides, which is assigned to the passengers. The rest of the boat is open, and the oarsmen, or, as they call

themselves *marineros* (sailors), are without protection, and sleep upon their benches at night, covered only with their blankets, and with the gunwale of the boat for a common pillow. The captain, or *patron*, is the steersman, and occupies a narrow deck at the stern, called the *pineta*, upon which he also sleeps, coiling himself up in a knot, if the boat is small and the *pineta* narrow. The freight, if liable to damage from exposure, is covered with raw hides, which, between sun and rain, soon diffuse an odor very unlike the perfumes which are said to load the breezes of Araby the Blest. The usual freightage from San Juan to Granada—a distance of 160 or 170 miles—is from 30 to 50 cents per cwt.; if the articles are bulky, it is more. The boatmen are paid from seven to eight dollars the trip, down from Grenada and back, which usually occupies from twenty to thirty days, although with proper management it might be made in less time. Time, however, in these regions is not regarded as of much importance, and every thing is done very leisurely.

Nicaragua, a Republic of Central America. It extends from lat. 10° 45' to 13° 20' N., at the Bay of Conchagua, on the Pacific Ocean, long. 83° 40' to 87° 40' W.; having west the Pacific Ocean, east the Caribbean Sea, and part of the so-called Mosquito territory, north the State of Honduras and San Salvador, and South Costa Rica. Area about 49,000 square miles. The Republic is divided into five Departments, each of which has several judicial districts, as follows:

Departments.	Pop.	Districts.
Meridional	20,000	Rivas or Nicaragua.
Oriental	95,000	Acayapa or Chontales, Granada, Masaga, and Managua.
Occidental	90,000	Leon and Chinandega.
Septentrional of Matagalpa ..	40,000	Matagalpa.
Septentrional of Segovia ..	12,000	Segovia.
Total	247,000	

The population here given is the results arrived at, in round numbers, by a census attempted in 1846. It was only partially successful, as the people supposed it preliminary to some military conscription, or new tax. The principal towns of the State, with their estimated population, are as follows:

Leon (the capital), including Subtiava ..	25,000	Puebla Nueva	2,900
Chinandega	11,000	Nagorote	1,800
Chinandego Viejo	8,000	Souci	2,500
Realajo	1,000	Managua	12,000
Chichigalpa	2,800	Massaya	15,000
Posulteiga	900	Granada	10,000
Telica	1,000	Nicaragua	8,000
Somotillo	2,000	Segovia	8,000
Villa Nueva	1,000	Matagalpa	2,000

It is a singular fact that the females greatly exceed the males in number. In the Department Occidental, according to the census, the proportions were as *three to two*! The civilized Indians, and those of Spanish and negro stocks crossed with them, constitute the mass of the population. The individuals of pure European extraction constitute but a small part of the whole, and are more than equaled in number by those of pure negro blood. The entire population may be divided as follows: Whites, 20,000; negroes, 15,000; Indians, 80,000; mixed, 130,000.—Total, 250,000. Most of these live in towns, many of them going two, four, and six miles daily to labor in the fields, starting before day and returning at night. The plantations, “*haciendas*,” “*hattos*,” “*ranchos*,” and “*chacras*,” are scattered pretty equally over the country, and are reached by paths so obscure as almost wholly to escape the notice of travelers, who, passing through what appears to be a continual forest from one town to another, are liable to fall into the error of supposing the country almost wholly uninhabited. Their dwellings are usually of canes, thatched with palm, many of them open at the sides, and with no other floor but the bare earth, the occupation of which is stoutly contested by pigs, calves, fowls, and children. These fragile structures, so equal- ble and mild is the climate, are adequate to such pro-

tection as the natives are accustomed to consider necessary. Some of them are more pretending, and have the canes plastered over and whitewashed, with tile roofs, and other improvements; and there are a few, belonging to large proprietors, which are exceedingly neat and comfortable, approaching nearer our ideas of habitations for human beings. A large part of the dwellings in the towns are much of the same character. The residences of the better classes, however, are built of adobes, are of one story, and inclose large courts, which are entered under archways, often constructed with great beauty. The court-yard has generally a number of shade trees, usually orange, making the corridors, upon which all the rooms open, exceedingly pleasant.

In October, 1855, Walker, an adventurer from California, landed in Nicaragua with a force of one hundred and fifty men, and being favored by part of the inhabitants, succeeded in effecting a revolution. From this time until 1857 he held possession of the country, though with varied success, against all forces brought against him. In 1857, his expected reinforcements from the United States failing to arrive, he was forced to retreat, and with an almost total loss of his army, and finally had to accept the offer of the United States sloop *St. Mary* to convey himself and command to the United States.

Unfortunately, agriculture is at a very low ebb, and but a small portion of this valuable land is made available. The productions are indigo, of which from 800 to 1000 zeroons are manufactured yearly; sugar, coffee, cacao, and cotton—the last of superior quality, and formerly raised in large quantities; Indian corn, rice, beans, and plantains, the staple food of the people, are raised in abundance; wheat, also, is grown in the mountainous and cooler parts of the country. Fruits, of various kinds, are plentiful, including excellent oranges and lemons. One of the principal sources of wealth consists in cattle, of which there are great numbers in all parts, particularly in the districts on the eastern side of the lake, where extensive and excellent pasturage is met with. The chief exports of the State are indigo, Nicaragua wood, and hides. The executive has the title of Supreme Director, with two counselors, a legislative chamber and senate. From the reports of the Minister of Finance, it was estimated that the receipts into the State Treasury for the year ending 30th June, 1851, would amount to \$122,682, and the expenses to \$173,646, leaving a deficit of \$50,964. This, added to the standing debt of the State, \$523,905, makes a total debt of \$574,869.

Commerce with the United States.—On the 19th day of April, 1850, a treaty was concluded between the United States and Great Britain, in respect to a proposed ship-canal between the Atlantic and the Pacific, by which both governments stipulate and declare that “neither the one nor the other will ever obtain or maintain for itself any exclusive control over the said ship-canal.” The 8th article further stipulates that the two governments shall “extend their protection, by treaty stipulations, to any other practicable communications, whether by canal or railway, across the isthmus which connects North and South America, and especially to the inter-oceanic communications, should the same prove to be practicable, whether by canal or railway, which are now proposed to be established by the way of Tehuantepec or Panama.” This treaty contains other stipulations relative to the Mosquito coast, Central America generally, etc., but nothing of commercial interest. General information respecting the Central American States is exceedingly limited; though, both for its productions and its geographical position, the country is one of great interest and importance. It abounds in all the precious and useful minerals, and produces almost spontaneously the varied and luxuriant staples of the tropics. It has been termed the portage or stepping-stone between

the commerce of Europe and Eastern Asia, and between the Atlantic and the Pacific possessions of the United States; and on this account is now the scene of active operations for facilitating its transit. Of the many routes by which the passage is deemed practicable, that by the way of the Rio San Juan and Lakes Nicaragua and Leon is said to be the most so; and here, therefore, the great inter-oceanic canal may, it is thought, be eventually constructed. The routes vary in length from 133 to 279 miles. By these routes, in comparison with the older ones, the distance from New York to Canton will be reduced from 17,100 to 12,600 miles; to Calcutta, from 15,000 to 14,000; and to Singapore, from 15,800 to 13,000; while from England to those places the distance will be materially increased. "In a commercial point of view, therefore," says a late statistical publication, from which these facts are gleaned, "England can care but little about the canal as proposed, since without it her advantages are much superior to those of the United States in the Asiatic trade."

The trade with the United States has been decreasing for a number of years, as is shown by the following:

	Exports to United States.	Imports from United States.
Total trade from 1830 to 1840...	\$2,037,000.	\$2,600,000
" " " 1840 to 1850...	1,265,000...	964,000

Nicaragua, or Peach Wood (Ger. *Nicaragaholz*, *Blutholz*; Du. *Bloedhout*; Fr. *Bois de Sang*, *Bois de Nicaragua*; It. *Legno sanguigno*; Sp. *Palo de sangre*; Port. *Pao sanguinho*), a tree of the same genus (*Cesalpinia*) as the Brazil and sapan wood; but the species has not been exactly ascertained. It grows principally in the vicinity of the lake of Nicaragua, whence its name. It is said by Dr. Bancroft to be almost as red and heavy as the true Brazil wood, but it does not commonly afford more than a third part, in quantity, of the color of the latter; and even this is rather less durable and less beautiful, though dyed with the same mordants. Nicaragua, or peach woods, differ greatly in their quality as well as price; one sort being so deficient in coloring matter that six pounds of it will only dye as much wool or cloth as one pound of Brazil-wood, while another variety of it will produce nearly half the effect of an equal quantity of Brazil-wood, and will sell proportionally dear.—BANCROFT on *Colors*, vol. ii.

Nickel, a scarce metal, which occurs always in combination with other metals, from which it is exceedingly difficult to separate it. When pure, it is of a fine white color resembling silver. It is rather softer than iron; its specific gravity, when cast, is 8.279; when hammered, 8.932. It is malleable, and may without difficulty be hammered into plates not exceeding one hundredth part of an inch in thickness. It is attracted by the magnet, and is not altered by exposure to the air, nor by being kept under water. It is employed in potteries, and in the manufacture of porcelain.—THOMSON'S *Chemistry*. The cobalt ores are commonly employed in the extraction of nickel, and they are now treated by the method of Wöhler to effect the separation of the two metals. The arsenic is expelled by roasting the powdered *speise*, first by itself, next with the addition of charcoal powder, till the garlic smell be no longer perceived. The residuum is to be mixed with three parts of sulphur and one of potash, melted in a crucible with a gentle heat, and the product being edulcorated with water, leaves a power of metallic lustre, which is a sulphuret of nickel free from arsenic; while the arsenic associated with the sulphur, and combined with the resulting sulphuret of potassium, remains dissolved. Should any arsenic still be found in the sulphuret, as may happen if the first roasting heat was too great, the above process must be repeated. The sulphuret must be finally washed, dissolved in concentrated sulphuric acid, with the addition of a little nitric, the metal must be precipitated by a carbonated alkali, and the carbonate reduced with charcoal. Nickel forms twelve per cent. of the new cent authorized by Congress in 1857.

Since the manufacture of German silver or Argentin became an object of commercial importance, a great deal of attention has been bestowed upon nickel by mineralogists, chemists, and nickel-workers, and its extraction from its ores has been undertaken upon a considerable scale. It is sparingly found, and in comparatively few localities, and even in those it is usually associated with cobalt. In consequence of its rarity it is generally classed among the precious metals. It is, when pure, almost as white as silver, and both ductile and malleable, either when hot or cold. It may be made into mariners' compasses, being susceptible of magnetism. It does not oxidize or rust by contact with air, and only melts, when pure, at an intense heat. It makes other metals harder and brittle when alloyed with them. The nickel used for alloys is usually obtained from what the Germans call Kuffer Nickel or Copper Nickel, which is an arseniuret or compound of arsenic with nickel, which is hard and has a metallic lustre of a coppered color inclining to brown or gray, and displaying all the hues of the rainbow. It contains 56 parts of arsenic and 44 of nickel, when pure, but usually contains a little iron, lead, sulphur, and antimony.

The Chinese probably first made use of nickel; their *white copper*, or pack-fong, contains about 32 nickel, 40 copper, 25 zinc, and 3 iron; but the proportions vary more or less. The composition known as British plate is an alloy of nickel, the ores from which the Birmingham people extract it being imported principally from Norway and Hungary. In Saxony they produce twenty thousand pounds of nickel a year, and in Prussia about nine thousand pounds. In Germany they make it into German silver, and in this country our Mint is busily engaged in making it into money.

Nickel is obtained at Chatham, in Connecticut; also in Missouri, in the chrome mines of Maryland and Pennsylvania, and in Lancaster County, Pennsylvania.

Nile (*Nilus*), a great river of East Africa, formed by the union of the *Bahr-el-Abiad* (White River) and the *Bahr-el-Azrek* (Blue River). The first, which is regarded as the true Nile, is supposed to rise on the eastern edge of the table-land of East Africa, about lat. 2° S., long. 34° E., but its source is unknown. Expeditions sent by the Pacha of Egypt in 1840–2 traced it to lat. 4° 42' N., in long. 30° 58' E. Here the navigation was interrupted by a ledge of rock; it flows generally north, with a width of from one to two miles, and joins the *Bahr-el-Azrek* at Khartum, in Nubia (lat. 15° 37' N.). The second rises in Abyssinia, in lat. 10° 59' 25" N., long. 36° 55' 39" E. It flows north 55 miles, when it enters Lake Dembeah on the southwest; emerging from the lake on the southeast, it flows in the form of a curve, first south, then west and north-west, traversing in its course several mountain chains, and descending by numerous falls into the plains of Nubia, where it passes Sennaar. Its confluence with the *Bahr-el-Abiad* forms the Nile, which from this point flows northeast, north, and northwest past Halfay, Shendy, and Berber to lat. 19° 20', where it turns to the southwest, forming a wide curve called the Great Bend. In lat. 18° it again turns northward, and continues in a northerly direction past Dongola, Girgeh, Siout, and Cairo to its mouth, near Assouan; and from the junction of its head streams to its delta its basin is formed by two parallel chains of mountains, which in some places close upon it and form rapids, and in others open up and leave fine plains between them and the river. It forms the first cataract (in ascending) near Essouan, lat. 24° 10' N., the second being in lat. 21° 52' 20" N., and the third in lat. 19° 40' N. Its banks are generally elevated in Nubia; they are less so in Middle Egypt, and absolutely flat in the Delta. From Essouan to the sea the average fall is two inches to a mile, and its mean velocity is about three miles an hour. Its length from supposed source, following its bends to the sea, is about 3000 miles (direct distance 2300 miles).

The delta of the Nile commences in lat. $30^{\circ} 7' N.$, where its waters spread out into numerous streams in the form of a triangle, extending at its base on the Mediterranean over a space of 120 miles; the two principal mouths are the west, or Rosetta branch, and the east, or Damietta branch. The others are the Bourlos and Dibe mouths. The system of the Nile is an anomaly among rivers; in ascending its course no affluent is met with for 1400 miles, the first being the Atbara in Nubia, which joins it on the right, 27 miles south of Berber. It is the only great tropical river which, by its periodical inundations, fertilizes a country surrounded throughout a great part of its course by sandy deserts. The waters begin to rise in June, and they subside in September. —See EGYPT. From time immemorial the Egyptians have made use of canals for the purpose of extending the inundations. The rise of the Nile appears due to the periodical rains which fall in the tropical regions of Africa from June to September. In Upper Egypt the swelling of the river amounts to about 30 feet, and at Cairo to 24 feet, perpendicular.

Ning-po, a city of China, province of Che-kiang, and one of the five ports recently opened to foreign trade, on the Takia, or Ning-po River, the mouth of which is directly opposite Chusan, 95 miles east-southeast of Hang-chow-foo, on a tongue of land at the influx of an affluent into the river, here crossed by a bridge of boats; lat. $29^{\circ} 54' N.$, long. $121^{\circ} 32' 30'' E.$ Population estimated at between 200,000 and 300,000. The city, six miles in circumference, inclosed by walls 25 feet in height, and entered by six gates, is surrounded by a fine plain covered with villages and water-courses. It has well-supplied shops, a temple of large size, hexagonal tower 150 feet high; a missionary hospital, opened in 1843; an active trade in junk-building, and a large manufacture of silks for export to Japan. It has been reported that about 670 junks come to it annually from Shang-tung and Leao-tong with oil, provisions, fruits, caps, cordage, horns, drugs, rice, and silk; 560 from Fo-kien and Hai-nan with sugar, alum, pepper, black tea, indigo, salt, rice, and dye-woods; from Canton and the Straits some vessels; and from the interior about 4000 small craft yearly; the total imports being estimated at \$7,650,000 annually. It exports large quantities of wood and charcoal to Shang-hai, the trade of which port it has crippled, from being by several days nearer to the green-tea districts. It was taken by the British, without resistance, in 1841, when was captured a ponderous bell, now in the British Museum.

Nitric Acid, Aquafortis (Fr., *Acide Nitrique*; Germ., *Salpetersäure*), exists, in combination with the bases potash, soda, lime, magnesia, in both the mineral and vegetable kingdoms. This acid is never found insulated. It was distilled from saltpetre so long ago as the 18th century by igniting that salt, mixed with copperas or clay, in a retort. Nitric acid is generated when a mixture of oxygen and nitrogen gases, confined over water or an alkaline solution, has a series of electrical explosions passed through it. In this way the salubrious atmosphere may be converted into corrosive aquafortis. When a little hydrogen is introduced into the mixed gases, standing over water, the chemical agency of the electricity becomes more intense, and the acid is more rapidly formed from its elements, with the production of some nitrate of ammonia.

Noble, an ancient money of account, containing six shillings and eightpence sterling, or in United States currency equivalent to one dollar and sixty cents.

North America lies between the 16th degree of north latitude and the Arctic Ocean. It is more irregular in form than South America, but of greater uniform breadth, larger in area, and more deeply indented with gulfs, bays, and inlets. Two extensive elevations or mountain ridges extend near and parallel, the one to its east and the other to its west coast. Between these is a vast plain, the largest in the world, stretching from the Gulf of Mexico to the Arctic

Ocean. In this plain are situated the great lakes of North America, and through it flow the rivers Mississippi, the Mackenzie, and the St. Lawrence, the one forming a southern, the other a northern, and the third an eastern drain for its superfluous waters. Its coast indentations and inlets are Baffin's Bay and Hudson's Bay on the north; the Gulf of St. Lawrence on the east coast; the Gulf of Mexico on the south; the Gulfs of California and Georgia, and Cook's Inlet, on the west. The coast of North America is very extensive, extending in an irregular line from Davis's Strait to the Florida Channel about 4800 miles, and from the latter along the inland sea to Tehuantepec about 3000. The whole length on the Pacific side to Behring's Strait is about 10,000 miles. The extent of the north and northeast shores can not probably be less than 8000 miles. The entire extent will thus be 22,800 miles. The most remarkable physical characteristics of North America are its sandy deserts, treeless steppes, and prairies; the first stretch along the base of the Rocky Mountains to the 41st degree of north latitude, having an average breadth of 200 to 500 miles. The steppes form another cheerless and extensive region in the northern part of the continent. The prairies or savannas, peculiar characteristics of North America, are chiefly in the Mississippi Valley. They consist of extensive and generally irregular tracts without trees, covered in the spring with bright verdure, intermingled with fragrant flowers. A vast extent is also occupied by forests, comprising probably not less than 600,000 square miles.

Mountains.—Of these there are four principal systems in North America: the Oregon or Rocky Mountains—a continuation of the Andes—the Sierra Nevada or Snowy Mountains of California, merging in its passage northward into the coast range, and the Alleghenies or Appalachian range, extending northeast parallel with the coast. The Rocky Mountain range is a continuation of the Andes, forming the elevated tableland passing centrally through Mexico; thence trending north, divide the waters entering the Pacific and Atlantic Oceans, and continue to the Arctic coast. Several peaks rise above the line of perpetual snows. The Sierra Nevada of California and coast range extend nearly parallel with the Rocky Mountain range, and are connected with the latter by several transverse ridges. The Alleghany range stretches along the eastern portion of the continent. It rises in the gently undulating ridge dividing the waters of the Tennessee from those flowing into the Mississippi and the Gulf of Mexico, and trending across the country in the same general direction from southwest to the northeast, terminates in the headland of Gaspé.

Rivers and Lakes.—The principal rivers are the Mississippi, with its affluent the Missouri, and the St. Lawrence. The first is the largest river in North America, and one of the greatest on the earth, occupying, with its tributaries, the whole of the southern portion of the great central basin of North America. It has its origin in the junction of streams formed on the eastern declivity of the Rocky Mountains, between lat. 42° and $50^{\circ} N.$, and enters into the sea in the Gulf of Mexico in lat. $29^{\circ} N.$ Its whole course, which is from north to south, is calculated to exceed 4400 miles. The St. Lawrence rises under the name of the St. Louis, in lat. $47^{\circ} 45' N.$, long. $93^{\circ} W.$; entering Lake Superior, it flows a southeast and a northeast course, and enters the Gulf of St. Lawrence at Cape Gaspé, where it has expanded to one hundred miles in width. The Mackenzie issues from the Great Slave Lake, from which it flows nearly due north, and enters the Arctic Sea, lat. $69^{\circ} 10' N.$ In the number and magnitude of its lakes North America is unequalled. They form one of its most noted features, and in conjunction with its rivers present a medium of commercial intercourse wholly unsurpassed. The principal are Lakes Superior, Michigan, Huron, Erie, and Onta-

rio, which together cover an area of 100,000 square miles. Following the chain of lakes which crosses the country in a northwestern direction, there occur Lakes Winnipeg, Woolaston, Deer Lake, Athabasca, Great Slave Lake, and Great Bear Lake. The Great Salt Lake in Utah, and Mono Lake and Lake Chapala in Mexico. There are, besides these, many smaller yet considerable bodies of water, viz., St. Clair, midway between Lakes Huron and Erie; the Lake of the Woods, between Lakes Superior and Winnipeg; Nepissing, Simcoe, Champlain, and many others of lesser magnitude.

Islands.—In the Atlantic Ocean the principal are Newfoundland, Anticosti, Prince Edward Island, and Cape Breton, all lying at the embouchure of the St. Lawrence; Nantucket, Long Island; the Bahama Islands, off the coast of the Carolinas; and the Columbian Archipelago, comprising the islands of Cuba, Hayti, Jamaica, Porto Rico, Santa Cruz, Antigua, Guadalupe, Martinique, St. Lucia, Barbadoes, St. Vincent, Tobago, Trinidad, and other small islands. On the northwest coast the principal are the California group; Vancouver, Queen Charlotte, Prince of Wales, Sitka, and Admiralty Islands; and on the extreme northwest the Aleutian group. In the Arctic Ocean there are a vast number of islands of which but little is yet known.

Geology, Mineralogy, etc.—A remarkable analogy exists in the structure of the land in North America and Central and Northern Europe. Gneiss, mica, schist, and granite prevail in wide areas in the Alleghanies, on the Atlantic slope and the northern latitude of the American continent, and in the high and middle latitudes the silurian strata extend over 2000 miles. Crystalline and Silurian rocks form the substratum of Mexico, for the most part covered with Plutonic and volcanic formations and secondary limestone. The Rocky Mountains are mostly silurian, except the eastern ridge, which is of stratified crystalline rocks, amygdaloid, and ancient volcanic productions. The coast range has the same character, with immense tracts of volcanic rocks, both ancient and modern, especially obsidian. In North America volcanic action is entirely confined to the coast and high land along the Pacific. The principal minerals are gold, silver, copper, iron, lead, and coal. The first three are found in greatest abundance in Mexico, where there are nearly 3000 mines of gold and silver alone. Since 1848 the great field for gold gathering has been California, where large quantities have been obtained, and both silver and quicksilver have been found to abound. The silver supplied by the Mexican veins is extracted from a great variety of minerals, pure or native silver being of comparatively rare occurrence. The principal deposits of gold in the United States besides California occur in the primary rocks of the southeastern declivity

of the Alleghanies. The coal-fields are of prodigious extent, the Appalachian stretching without interruption 720 miles, with a maximum breadth of 280, and occupying an area of 63,000 square miles. The Pittsburg seam, ten feet thick, exposed on the banks of the Monongahela, extends horizontally 225 miles in length and 100 in breadth, and covers an area of 14,000 square miles. Besides the coal-fields named, there are various others of great extent in different parts of North America, including New Brunswick, Nova Scotia, and Vancouver Island. Iron is also extensively worked. Salt is widely diffused throughout the continent.

Climate.—The predominating character of the climate of North America is intense cold, although in some parts an oppressive heat prevails during a portion of the summer. Above the 50th degree of latitude the cold is so severe as to render the country all but uninhabitable, while frosts occasionally occur as low down as the 30th degree of latitude. In winter a keen and piercing northwest wind prevails throughout all North America, adding greatly to the rigor of the northern climate, and carrying its chilling influence into the more southerly regions. The transitions from cold to hot, or from winter to summer, are very sudden, especially in Canada. Among the causes of a lower temperature than obtains in Western Europe may be mentioned the small portion of the continent lying in the torrid zone, the Rocky Mountain range, and also the Sierra Nevada mountains near the Pacific Ocean, prevent the warm winds from the Pacific penetrating the interior; the great expansion of the land north and northeast, and the almost level plain in those directions, allow full scope for the piercing Arctic blasts. The narrowness of the Gulf Stream, and the prevailing winds taking the same general course, carry away from this continent the hot circumambient air, a source of warmth to Western Europe; and the cold polar oceanic current brings down the icebergs of Spitzbergen and Greenland to the shores of Labrador and Newfoundland.

The territorial limits of the United States include that portion of the continent of North America, extending from the Atlantic to the Pacific Ocean, which is bounded by the British possessions on the north, and by the Gulf of Mexico and the Mexican Republic on the South.

The superficial area of the Union, according to a computation made by the Topographical Bureau at the close of 1853, and subsequently reviewed and amended, amounted on the first of January, 1854, to two millions nine hundred and thirty-six thousand, one hundred and sixty-six square miles, being somewhat more than one third of the area of the continent of North America.

AREA OF NORTH AMERICA, EXCLUSIVE OF THE WEST INDIES.

Territory.		Square Miles.	Square Miles.
United States, as ascertained by the Topographical Bureau			2,936,166
British America	{ New Britain*	2,598,837	
	{ Upper and Lower Canada†	346,860	
	{ Nova Scotia, New Brunswick, Cape Breton, &c.	104,701	
Mexico			8,050,398
Central America			1,058,534
Russian America‡			208,651
Danish America (Greenland)§			394,000
			380,000
Total square miles			8,002,949

* According to Balbi's estimate of the area of North America. Another estimate gives New Britain but 1,800,000 square miles.

† M'Culloch. The late Canadian census gives 242,482 square miles as the area over which jurisdiction is actually extended.

‡ Guibert gives 982,500 kilometres carrés, or 371,611 square miles.

§ Greenland, from present information, would appear to be a trilateral island, 1500 miles long and 600 miles in its greatest breadth. Its area, therefore, can not be greater than we state above. Guibert gives the area of Danish America 3861 square miles, and M'Culloch only 170, meaning only that portion which has been explored.

|| The area of the continent of North America is variously estimated by geographers at from five to seven millions of square miles. Guyot ("Earth and Man") estimates it at 5,472,000, and that of Europe at 2,688,000, exclusively of islands.

The treaty of 1854 with Mexico settles the boundaries of the two republics as follows: "Retaining the same dividing-line between the two Californias as al-

ready defined and established according to the 5th article of the treaty of Guadalupe Hidalgo, the limits between the two Republics shall be as follows: Begin-

ning in the Gulf of Mexico, three leagues from land, opposite the mouth of the Rio Grande, as provided in the 5th article of the treaty of Guadalupe Hidalgo; thence, as defined in the said article, up the middle of that river to the point where the parallel of 31° 47' north latitude crosses the same; thence due west one hundred miles; thence south to the parallel of 31° 20' north latitude; thence along the said parallel of 31° 20' to the 11th meridian of longitude west of Greenwich; thence in a straight line to a point on the Colorado River, twenty English miles below the junction of the Gila and Colorado Rivers; thence up the middle of the said River Colorado, until it intersects the present line between the United States and Mexico."

For early history, etc., of North America, see *New England Magazine*, vii. 169; *Christian Review*, xiv. 610; *North American Review*, lxxiii. 210 (F. BOWEN).

North Carolina lies between 33° 50' and 36° 30' N. lat., and between 75° 45' and 84° W. long. from Greenwich, and between 6° 20' W., and 1° 33' E. long. from Washington. Area, 45,500 square miles. Population in 1790, 893,754; in 1800, 478,103; in 1810, 555,500; in 1820, 638,829; in 1830, 738,470; in 1840, 753,419; and in 1850, 868,903.

Physical Features, etc.—Along the entire coast of this State there is a ridge of sand separated from the main land in some places by narrow, and in other places by broad sounds and bays. The passages or inlets through it are shallow and dangerous, Ocracoke Inlet being the only one through which vessels pass. Capes Hatteras and Lookout are projecting points in this belt, and off them, particularly the former, is the most dangerous navigation on the coast of the United States. Cape Fear is on an island off the mouth of Cape Fear River. For 60 or 80 miles from the shore the country is level, the streams sluggish, and there are many swamps and marshes. The soil is sandy and poor, excepting on the margins of the streams, where

it is frequently very fertile. The natural growth of this region is mostly the pitch-pine. This tree affords tar, pitch, turpentine, and lumber, which constitute an important part of the exports of the State. In the swamps rice of a fine quality is raised. Back of the flat country, and extending to the lower falls of the rivers, is a belt of land about 40 miles wide, of a moderately uneven surface; a sandy soil, and of which the pitch-pine is the prevailing natural growth.

Throughout the State Indian corn is raised, and in some parts considerable cotton. In the low country, grapes, plums, blackberries, and strawberries grow spontaneously; and on the intervals canes grow luxuriantly, the leaves of which continuing green during winter furnish food for cattle. In the elevated country, oak, walnut, lime, and cherry trees of a large growth abound. Principal minerals coal, iron, and gold. It is the only State in the Union where every article enumerated in the census is produced.

Rivers.—The principal rivers are the Chowan, 400 miles long, navigable for small vessels 30 miles; Roanoke, Pamlico, navigable for 30 miles; Tar, Neuse, Cape Fear, the largest river in the State, 280 miles long, with eleven feet of water to Wilmington; the Yadkin, which forms a part of the Great Pedee in South Carolina.

The principal places in the State are, Raleigh the capital, Newbern, Wilmington, Fayetteville, Edenton, Elizabeth City, Beaufort, and Charlotte. On January 1st, 1850, there were three railroads, with 631 miles of track finished and in operation. Exports, 1852, valued at \$576,397. Imports, same year, \$300,488. Tonnage of the State, 1853, 56,875 tons. The first permanent settlement in this State was on the eastern bank of the Chowan River, about 1660, by emigrants, who, in consequence of religious persecution, fled from Nansemond, Virginia. The constitution of the United States was adopted in convention November 27th, 1789. Years, 193; days, 75.

COMMERCE OF THE STATE OF NORTH CAROLINA (SHOWING ALSO THE DISTRICT TONNAGE IN 1821, 1831, 1841, AND 1851) FROM OCT. 1, 1820, TO JULY 1, 1850.

* Nine months to June 30, and fiscal year begins July 1, 1843.

Principal Ports.—Beaufort, at the mouth of Newport River, is famous as possessing the finest harbor on the southern Atlantic sea-board. It will be the eastern terminus of the Atlantic and North Carolina railroad, which, when built, will open to its commerce an immense interior region, hitherto isolated from the coast. The impediment in the growth of this place up to this time has been in the want of internal facilities for commerce. The tonnage of Beaufort, in 1856, was 1991 tons. Wilmington, city, port of entry, situated on the left bank of Cape Fear River, just below the confluence of the northeast and northwest branches, about thirty-five miles from the sea. It is well situated for trade, but the location is accounted unhealthy. The harbor admits vessels of 800 tons, but the entrance has a dangerous shoal. Opposite the town are two islands, dividing the river into three channels. They afford the finest rice-fields in the State. In 1819, two hundred buildings were destroyed by fire, a loss of \$1,000,000. The tonnage in 1856 was 21,420 tons.—See *North American Review*, xxiv. 168; xii. 216 (J. SPARKS); *American Journal of Science*, xiii. 336; *Southern Review*, i. 235; DE BOW'S *Review*, ii. 30, 105.

Northwest Passage. The attempt to discover a northwest passage was made by a Portuguese named Cortereal, about A.D. 1500. It was attempted by the English in 1553; and the project was greatly encouraged by Queen Elizabeth in 1585, in which year a company was associated in London, and was called the "Fellowship for the Discovery of the Northwest Passage." From 1745 until 1818, Parliament offered £20,000 for this discovery. In 1818, the reward was modified by proposing that £5000 should be paid when either 110°, 120°, or 130° W. long. should be passed: one of which payments was made to Sir E. Parry. For their labors in the voyages enumerated in the *list below*, Parry, Franklin, Ross, Back, and Richardson, were knighted. The honor of completing the northwest passage is due to Captain McClure, who sailed in the *Investigator* in company with Commodore Collinson in the *Enterprise*, in search of Sir John Franklin, January 20, 1850. On September 6 he discovered high land, which he named Baring's Land; on the 9th other land, which he named after Prince Albert; on the 30th the ship was frozen in. Entertaining a strong conviction that the waters in which the *Investigator* then lay communicated with Barrow's Straits, he set out on October 21, with a few men in a sledge, to test his views. On October 26 he reached Point Russel (73° 31' N. lat. 114° 14' W. long.), where from an elevation of 600 feet he saw Parry or Melville Sound beneath them. The strait connecting the Pacific and Atlantic Oceans he named after the Prince of Wales. The *Investigator* was the first ship which traversed the Polar Sea from Behring's Straits to Baring Island. Intelligence of this discovery was brought to England by Commodore Inglefield, and the admiralty chart was published October 14, 1853. Captain McClure returned to England September, 1854. On June 19, 1855, a select committee of the House of Commons was appointed, on the motion of Mr. W. Mackinnon, to consider the claims of McClure and his companions. Sir G. Back, Sir James Ross, Sir R. T. Murchison, and Captains McClure, Kellett, and Collinson, were examined. The report was received July 20, in which the committee recommend that £5000 be paid to Captain McClure, and £5000 be distributed between the officers and crew.

1553. Sir Hugh Willoughby's expedition to find a northwest passage to China, sailed from the Thames, May 20.

1576. Sir Martin Frobisher's attempt to find a northwest passage to China.

1585. Captain Davis's expedition to find a northwest passage.

1594. Barentz's expedition.

1602. Weymouth and Knight's.

1610. Hudson's voyages; the last undertaken (see *Hudson's Bay*.)

1612. Sir Thomas Button's

1616. Baffin's.—See *Baffin's Bay*.

1631. Foxe's expedition.

[A number of enterprises undertaken by various countries followed.]

1742. Middleton's expedition.

1746. Moore's and Smith's.

1769. Hearne's land expedition.

1773. Captain Phipps, afterward lord Mulgrave, his expedition.

1776. Captain Cook in the *Resolution* and *Discovery*, July.

1793. Mackenzie's expedition.

1790. Captain Duncan's voyage.

1795. The *Discovery*, Captain Vancouver, returned from a voyage of survey and discovery on the northwest coast of America, September 24.

1815. Lieutenant Kotzebue's expedition, October.

1818. Captain Buchan's and Lieutenant Franklin's expedition in the *Dorothea* and *Trent*.

1818. Captain Ross and Lieutenant Parry, in the *Isabella* and *Alexander*.

1819. Lieutenants Parry and Liddon, in the *Hecla* and *Griper*, May 4.

1820. They return to Leith, November 3.

1821. Captains Parry and Lyon, in the *Fury* and *Hecla*, May 8.

1824. Captain Parry's third expedition with the *Hecla*, May 8.

1825. Captains Franklin and Lyon, after having attempted a land expedition, again sail from Liverpool, Feb. 16.

1827. Captain Parry, again in the *Hecla*, sails from Deptford, March 25.

1827. And returns, October 6.

1828. Captain Ross arrived at Hull, on his return from his arctic expedition, after an absence of four years, and when all hope of his return had been nearly abandoned, October 18.

1835. Captain Back and his companions arrived at Liverpool from their perilous Arctic Land Expedition, after having visited the Great Fish River, and examined its course to the Polar Sea, September 8.

1836. Captain Back sailed from Chatham in command of His Majesty's ship *Terror*, on an exploring adventure to Wager River. [Captain Back, in the month of December, 1835, was awarded, by the Geographical Society, the king's annual premium for his polar discoveries and enterprise, June 21.]

1839. Dease and Simpson traverse the intervening space between the discoveries of Ross and Parry, and establish that there is a northwest passage, October.

1845. Sir John Franklin and Captain Crozier, in the *Erebus* and *Terror*, leave England, May 24.

1849. Captain Ross returned from an unsuccessful expedition in search of Franklin.

1850. Another expedition (one sent out by Lady Franklin) in search of Sir John Franklin, consisting of two vessels, sailed from England, April-May.

1850. Still another, consisting of two vessels, the *Advance* and *Rescue*, liberally purchased for the purpose by Henry Grinnell, a New York merchant, and manned at Government cost from the United States navy, under command of Lieutenant De Haven, sailed from New York, May.

1850. Commanders Collinson and McClure, in the *Enterprise* and *Investigator*, sailed eastward in search of Sir John Franklin, January 20.

1850. Northwest Passage discovered by McClure, October 26.

1853. The second American Arctic Expedition left New York in search of Sir John Franklin, and for the purposes of science, May 31.

1855. McClure returned to England in October, 1854, and Collinson in May.

—See *American Journal of Science*, x. 138 (ISAAC LEA); *North American Review*, lxi. 1. (FORBE); HUNT'S *Merchant's Magazine*, iii. 52; *Edinburgh Review*, xxx. i. xlviii. 423; *American Quarterly*, iii. 505; *Quarterly Review*, xvi. 145, xxi. 213, xxv. 175, xxx. 231, lvi. 1.

Norway, kingdom of (Swed. *Nörrige*, Ger. *Norwegen*), a country of Northern Europe, united to the crown of Sweden, and forming the northwestern part of the Scandinavian peninsula, capital Christiana. It extends from Cape Lindesnae, lat. 57° 57' 8", to the North Cape, lat. 71° 10' 3" N., and between long. 4° 50' and 31° 15' E. The mountains of Norway contain rich minerals; but, from the difficulty of transport and the want of fuel, mining industry is but little developed. The only mines in operation are those of silver, copper, iron, cobalt, and chrome. The chief product is iron,

the mines of which are situated mostly in the Gulf of Christiania; the silver mine of Kongsberg is at present one of the richest in Europe, and, next to the copper mine of Roraas, the most important in the kingdom.

Manufactures, properly so called, scarcely exist in Norway. Brandy distilleries and saw-mills are the only extensive branches of industry; next to these are forges and metal foundries, the produce of which is exported in a raw state, except what is used in the manufacture of arms at Königsberg, and in the manufactures of iron ware and nails. The manufacture of cloth, linen, and cotton, as well as the preparation of skins and leather, are almost entirely domestic. The other manufactures comprise those of glass, paper, oil, gunpowder, soap, tobacco, and sugar refining. The principal forests are in the interior; the timber is felled in autumn and winter, and is conveyed over the snow to the coast. Holland is now the chief market for Norwegian timber. Fish is exported from all the towns on the west coast, but Bergen is the chief entrepôt. The most important branches of this trade are dried fish and salted herrings. The export of mineral products is less than might be expected, from the number of mines; the principal are iron, copper, and silver. The chief imports are salt, grain, and colonial produce. Commerce in the interior of the country is greatly impeded for want of means of communication; none of the rivers are navigable except near their mouths. Good roads exist only between the towns of the south coast and the principal valleys in Nordland and Finmark; the usual communication is by sea. Among the numerous islands on the west coast, there are violent and irregular currents, which render the coast navigation dangerous. Among these is the celebrated *Maelstrom*, or *Moskenes-Strom*, the danger from which has been greatly exaggerated, since it can at nearly all times be passed over even by open boats. Regular communications have successively been established between the principal towns of the coast from Christiania to Hammerfest, and steam vessels ply in the Gulf of Christiania, and on the lakes of Miösen and Tyrfjord. Norway has a national discount bank, established 1817, which has the exclusive right of issuing paper money.

* Lasts = two tons.

Owing to the difficulty of transport, all the seats of industry, and the only towns, are on the coast, and chiefly on the Gulf of Christiania. Ship-building is actively carried on in the ports. In the Middle Ages, the commerce of Norway consisted exclusively in the exportation of fish, and this is still the most important article of trade. Next to this is the export of timber, which was commenced by the Dutch in the sixteenth century; and, lastly, the products of the mines and metal forges. The timber exported annually amounts to 200,000 lastes, value 1,685,000 specie dollars.

Norway possesses nearly the same natural advantages as Sweden. The inhabitants are chiefly employed in the breeding of horses, sheep, goats, and the reindeer; cultivating small farms, fishing, mining, and such other occupations as a country rich in its forests and minerals, and enjoying a favorable position for commerce, usually affords. Historians represent the ancient navigation and trade of Norway as being in a highly flourishing condition, especially when its towns, in the twelfth century, joined the Hanseatic League. As early as 1217, England concluded a treaty (the first she ever made with a foreign power) with Norway, stipulating an entire reciprocity of trade between the two countries. The trade of Norway has always consisted of the interchange of the produce of her forests, of her copper and iron mines, and of her fisheries, for such articles as she required from foreign countries. The principal sea-ports are Bergen, Trondheim, Christiania, Hammerfest, and its outport Wardæhuus. Denmark occupies the first rank in the foreign trade of Norway. So much of its trade passes through the ports of this country, particularly Altona, that Denmark may be justly considered the commercial entrepôt of Norway. Its commercial relations with nearly all the countries of Europe are conducted through these ports; and it was not until during the recent troubles in the duchies of Denmark that Norway manifested any disposition to export direct from the producing country. The maritime industry of the Norwegians constitutes the commercial bond which unites them with Denmark. Sweden, on the other hand, being separated from the more populous and industrious divisions of Norway by mountainous and sterile territories, necessarily confines her commercial relations with the sister kingdom to the southern frontier or the coast; and, as their principal productions are generally similar, these relations are not susceptible of any great development.

The Hanse Towns have long been the principal entrepôts for the commercial movements of the north of Europe. The relations of Hamburg with Norway are, even at this day, considerable; but for the past few years they have been stationary, with rather a decreasing tendency. With England, on the other hand, the trade of Norway is becoming more important every year. This is mainly owing to the liberal commercial system of the former country, under which Norway is enabled to compete with British colonial possessions, in America, in supplying the British markets with the varied productions of her forests. France and Holland chiefly import into the markets of Norway colonial or raw produce; but neither of these countries find, in Norwegian markets, a profitable exchange for their manufactures: Holland, because she has but few; and France, for the reason that her works of art and taste are too costly, and perhaps not very well adapted to meet the wants of a people whose cold and inhospitable climate, as well as their maritime occupations, would seem to demand the coarser qualities of manufactures. From official documents recently published, it appears that in 1848 the population of Norway was 1,200,000 souls; their merchant marine counted 3400 vessels, measuring an aggregate of 240,000 tons, and employing 16,500 persons as officers and crews. This would give to Norway one vessel for every 352 inhabitants, and make every seventy-third subject a sailor. At the

same period, the total merchant marine of France consisted of 14,235 vessels, measuring an aggregate of 670,000 tons.

With the United States the trade of Norway is chiefly indirect. Tobacco and cotton are the principal articles of American produce which enter into the consumption and manufactures of the Norwegians. The restrictive character of the tariff of Norway, however, like that of her sister kingdom, and the fallacious principles on which her fiscal and commercial legislation has been so long maintained, must ever prove an insuperable obstacle to the expansion of her foreign trade, and the consequent development of her vast internal resources. So long as Norway adheres to the now generally obsolete idea that the best way to raise revenue and relieve the land-owner is to levy high duties on all goods imported into the country, so long will her relations with foreign countries be limited to the exchange of such articles of necessity as can not be elsewhere procured. The decline which her iron trade has experienced during the few years past, both in England and the United States, will necessarily compel the government of Sweden and Norway to look for a market in France; and it is understood that the latter government is not averse to such amelioration of her tariff as will open her markets to this great staple of Sweden and Norway, by a material reduction of her present seventy per cent. duty on iron. The only equivalent, however, which could satisfy France for so liberal a concession would be a total change in the Swedish and Norwegian tariffs, by which her own manufactures could enter the ports of the united kingdom, and find a profitable as well as a ready market. Nor could such a change in any manner have an injurious effect upon the manufacturing industry of either of these countries, as the great demand would be for such heavy and coarse manufactures as are most needed in so northern a latitude, and which never have been, and perhaps never will be, successfully manufactured in Sweden or Norway—at least, to any extent approximating the great consumption of the kingdom. Such a result would extend its benefits to other countries besides France; and if, in addition to a remodification of the Swedish and Norwegian tariffs in respect of manufactures, the present exorbitant cent-per-cent. duties on American tobacco were liberally reduced, the trade between the United States and Sweden and Norway would be materially benefited, and exports and imports, direct between the two countries, largely augmented.

The Norwegian tariff differs, in many essential particulars, from that of Sweden. Its range is considerably lower, and, owing to this fact, and to the advantages resulting from different weights, it will be found (for instance) that tobacco blades may be imported into Norway at a rate nearly 33.3 per cent. less than into Sweden. The oppressive system of fictitious valuation, in practice in the Swedish custom-houses, is unknown in the sister kingdom; and, besides, greater consideration is shown to the poorer inhabitants of remote provinces. At Brødø and Tronsø, in the northern part of Norway, many articles are admitted at half rates of duty; and at Hammerfest and other remote ports the duty is altogether remitted. This consideration is not shown to the inhabitants of far-off provinces in Sweden; indeed, in districts no farther off than Dalecarlia many necessities of life, which the country can not supply to them, must be purchased, if at all, by the poorer peasantry, with the additional costs of inland transportation and the coast navigation of the Gulf of Bothnia. The tariff now in operation came in force on January 1, 1855, and will expire on the 31st December, 1857. The duties on tobacco have been raised nearly to the level of those of Sweden. The latter, upon tobacco blades, is still one cent per pound higher. The augmentation of the duty on this staple of the United States was, doubtless, designed as an additional argument in any negotiations which might be proposed by the government of

Sweden and Norway relative to the iron duties of the United States.

The following brief summary is presented of the new tariff. It will show the duties levied on certain American produce by the old and new Norwegian tariffs:

Tobacco.—(Stem and blade), raised from 5 to 6 skillings per lb. The skilling is nearly equivalent to one cent.

Rice.—Unchanged; namely, 80 skillings per barrel (in husk), or 1½ skillings per lb., without husk or ground.

Cotton.—Raw, unchanged; one-half skilling per pound.

Maize, unground.—Lowered from 72 skillings to 16 skillings per toende (barrel of nearly four bushels).

Maize, ground.—Lowered from 16 skillings to 7½ skillings per lispund (17.6 lbs. avoirdupois).

Wheat.—Unchanged; 72 skillings per barrel (toende).

Flour.—16 skillings per lispund.

The principal ports of Norway are Christiana, Bergen, and Hammerfest, or Alten Hammerfest, the chief port of Finmark. Christiana is a deep sea-port, having at all seasons from six to seven fathoms depth of water close to the quay. It is the capital of Norway, and has some few fabrics of woolen, glass, hardware, soap, leather, cordage, tobacco, etc. The deals of this port have ever been celebrated. Its trade has flourished as far back as 1792, in which year the number of ships arrived was 521, of which 518 cleared with cargoes of deals. Bergen has a safe and deep harbor close to the town, but a pilot is necessary for vessels entering or departing, on account of the numerous rocks. It has a few manufactories of tobacco and earthen-ware, several rope-works and distilleries, ship-yards, forges, and other establishments of ordinary handicraft. Its fisheries, however, are its chief resource, and its foreign trade is principally confined to Hamburg. Hammerfest has an extensive trade, chiefly with England, through the port of Hamburg. Its exports are copper, dried stock-fish, salted fish, fish-oil, rein-deer skins, buckskins, walrus hides and teeth, feathers, fox and other skins, etc. Finmark has always enjoyed a high degree of commercial prosperity. Its revenues exceed its expenditures by upward of two millions of dollars. Its chief wealth depends upon its fisheries, a source of remunerative industry that never fails. For centuries back, observes Macgregor, not a single example can be given of a total failure. The value of these fisheries may be estimated from the fact that in five years, ending with 1844, the produce of cod, seth, and halibut was about 500,000 tons, and 20,000 barrels of oil, independently of what was taken by the Russians.

Coarse cottons and woolens are well adapted for the markets of Norway, more especially of Finmark; but the commercial privileges reserved to Russia, by treaty, have hitherto secured to that power the monopoly of this trade. Her linens, raven's-duck, and various other manufactures, are admitted free into Finmark; while duties, varying from 50 to 100 per cent. on the cost price, are interposed on similar manufactures of other foreign countries.

Woolens and cottons admitted even at a moderate duty, American and British manufactures of that description would soon supersede the almost general use of Russian fabrics.

The present condition of the trade of Norway may be gathered from the following summary: Number of vessels from all countries entered in 1850, 8542, measuring in the aggregate 1,174,501 tons; of these there were Norwegian, 5818 vessels, of 881,320 tons. From the United States there arrived but nine vessels—seven carrying 2654 tons of merchandise, and two being in ballast—all under the Norwegian flag. The principal countries of departure of nearly all the others were England, Holland, and Prussia.

During the same year, there cleared from Norwegian ports 8479 vessels, measuring 1,182,332 tons. Of these

there were destined for the United States 31 vessels, floating 13,178 tons of merchandise; 30 being under the Norwegian flag, and one being foreign. From these figures, it will be seen that there arrived from Norway in the United States 31 vessels, carrying 13,178 tons of Norwegian products, against nine cleared from the United States for Norway with American products to the amount of 2654 tons; or a difference of 22 vessels and 10,524 tons of merchandise against the United States in the direct trade with Norway. The restrictive tariff regulations of the latter country will readily account for this great inequality. In 1850, Norway imported upward of 1,700,000 lbs. of cotton. In 1852, the total importation of cotton amounted in value to 1,927,560 francs; viz.: from Great Britain, 1,071,200 francs; from the United States, 650,700 francs; from other places, 205,660 francs; making a total of 1,927,560 francs, or \$266,236 40. In 1850, there were imported into Norway 3,000,000 lbs. of tobacco, 8,000,000 lbs. of sugar, 6,500,000 lbs. of coffee. During the same year the effective merchant marine of Norway consisted of—

Vessels of	Number of Vessels.	Tons.	Crews.
Under 28 tons	816	13,232	1,766

For the comparative statement of the commerce of the United States with Sweden and Norway, exhibiting the value of exports to and imports from each country, and the tonnage of American and of Swedish and Norwegian vessels arriving from and departing to each country, during the years designated, see SWEDEN.—*Edinburgh Review*, lxxv. 21, xxiii. 145, xxiii. 79; *Westminster Review*, xxvii. 164; *North British Review*, ix. 39; *Quarterly Review*, ii. 104; *Fraser*, xxiii. 478; *American Quarterly Register*, xiv. 119 (Rev. Dr. BAIRD); *Hunt's Merchant's Magazine*, xvi. 138.

Notaries Public. The origin of that class of public officers now called notaries public may be traced as far back as the ancient Roman Republic, although their functions now are different. We find, at the time of the Republic, *scribes* and *librarii*, who were public secretaries. The private secretaries were called *exceptores*, and also *notarii*, if they were short-hand writers, which service was frequently performed by slaves. The public secretaries were those whom the authorities of state appointed and paid to assist them in their duties of office, and they appear to have corresponded to our present actuaries and secretaries. It does not appear, however, that legal documents were drawn up by public functionaries resembling our notaries public. During the Empire the public secretaries increased both in number and importance. They appear to have been secretaries working in the cabinet of the Emperor, in distinct departments, and they had an overseer, called *magister scriniarum*. Distinct, however, from these persons were those who may be compared to our present notaries public, and who were called *tabelliones*. It seems that what even at the present day may be seen in Italian cities was already customary in the early days of ancient Rome; namely, that in the public market-place, or forum, scribes offered their services to persons who wanted to have letters written or documents drawn up.

This class of persons were called *tabelliones forenses*, or *personæ publicæ*. They occupied themselves with drawing up legal instruments and documents, and other writings (*libelli*) or statements, to be presented to the courts of law, or other authorities of state. It appears, from a "constitution" of Diocletian, that a tariff of fees was established for them. The number of *tabelliones* constantly increased. They then formed them-

selves into a guild or corporation (*schola*), under a presiding officer called *primicerius*. The state authorities began, more and more, to exercise surveillance over them, which even went so far that the magistrates determined whether a person should be admitted into, or an unworthy person be removed from, this guild of *tabelliones*. These persons prepared all kinds of legal documents and papers, but they still carried on their business in the public market-place. It was soon found necessary, for judicial purposes, to define by law what should be the requisites of such notarial acts and writings to make them legal evidence. It had become a usage, in important matters, to have witnesses also attest the papers drawn up by these public scribes or *tabelliones*, and it was finally required by law that three witnesses should attest a document, in case the principals could write, and five witnesses if the parties could not write. It was, moreover, required that the notary (*tabellio*) should be present in person at the drawing up of the document, and also affix his signature and the date of execution.

During the Empire another class of officers, called *tabularii*, came up in the cities. Their functions resembled somewhat our archivaries and auditors. They also made out certain documents, and these bore sometimes the names both of a *tabellio* and a *tabularius*; but at a later period both names are used as synonymous. Under the Frankish kings Roman institutions were imitated. In the imperial bureaux the emperors needed and employed persons for drawing up documents and countersigning them. These officers were called *referendarii*, *cancellarii*, and *notarii*. The chief of these officers was called *archinotarius* or *summus notarius*, but at a later period *cancellarius*, as a more honorable title. The Frankish kings, as early as the year 803, appointed these officers, and issued laws to prevent the abuse of their power. It became later the sole prerogative of the kings to appoint these notaries, but by degrees the Popes of Rome also assumed the same right; and we find in documents notaries named who were appointed by princes and bishops, and even by cloisters. The legal powers of notaries during the Middle Ages, and their condition as a distinct class of officers, are distinctly seen in the Italian cities. They acted either by authority of the Emperor or that of the Pope, and were engaged for drawing all the various legal documents, and especially last wills and testaments, which were received in all the courts of law as full proof. They were formed into a guild, called *collegium*, and had their own prefects, called *consules*. A candidate for admission into this college had to undergo an examination. Minute and strict rules for the drawing up of instruments, and their attestation, were prescribed. The study of notarial functions was reduced to rules, and notarial schools were established in many cities.

Notaries came to be regarded at an early period as a kind of judges (*judex chartularius*), and a practice grew up among them of inserting in bonds, or other documents of indebtedness, a power for the creditor of taking out execution, by application to the court, in case of non-fulfillment of the contract, which laid the foundation of the so-called "executory process," which prevails still in the Civil Law countries, and which corresponds somewhat to the warrant of attorney to confess judgment in the English law. We shall see that the foreign law on bills of exchange on the Continent of Europe gives this right of "executory process" to the creditor of these mercantile instruments, and thus strengthens the security of the creditor.

France.—In France the notaries have always played an important part in her judicial institutions, and they do so still. The king regarded it as his prerogative to appoint them, but the popes also arrogated this power, and the lords of provinces (*seigneurs*) assumed it likewise. They were regarded there as *juge ordinaire*, and inserted in their documents this executory power or

summary execution (*exécution parée*). The basis of the present rights and duties of notaries in France was laid by the law of 1791, which recognized no longer any royal notaries, but only *notaries public*, appointed by the general government. The law of the eleventh year of the Republic recognized them as public officers, appointed for the purpose of drawing up all papers and contracts which, either according to express laws or the will of parties, are to have the effect of public documents, and of fixing the dates thereof, of holding in safe-keeping these acts, and of making out copies of them for the use of the parties concerned. All documents made out in the presence of two notaries, or of one notary and two witnesses, and attested by them, receive full credence in all the courts of law, and are executory throughout the land. The original (*minute*) of the act remains in the hands of the notary, and copies are allowed to be given only to the interested parties, unless specially empowered by the courts. The law points out many cases in which the presence of a notary and his attestation of instruments are essential; e. g., with testaments, donations, marriage contracts, protests, etc. In most cases it is left to the choice of parties to employ a notary in the making out of instruments and documents. But the courts often appoint them, to undertake the part of mediator in some judicial proceedings; for instance, in cases of divorce, or in making out inventories, or in dividing and distributing property and estates, or in taking and making up accounts, like the Masters in Chancery in English law. The notaries are appointed for life, and can be removed only by a judicial decision. By their official position they become the advisers in families and the *confidants* of them. They become the mediators in disputes between the parties, and particularly in regulating and settling estates, and in the distribution of property.

The law of the seventh year of the Republic requires that all acts and documents made out by notaries be registered within ten days, the fees for which are very high. Hence it often happens that the notary must advance the money for the registration, and this obliges him to have sums of money always at his disposal. Thus notaries have gradually come to deal in money affairs in general, by loaning and investing money, and procuring money for borrowers. Hence it is that persons of property intrust their money and property to the hands of notaries, as being the fittest persons to invest it safely and advantageously. The great influence which they thereby must acquire in families and in all classes of society is manifest; and this great power could not but lead to great abuses. An ordinance of 1843 prohibited notaries, under heavy penalties, from entering into stock speculations, from acting as money-brokers, from investing money intrusted to them in their own names, etc. The requisites for becoming a notary in France are, that the candidate be a French citizen, twenty-five years of age, and that he has served as clerk with a notary for six years. But no man without property can expect to obtain a place as notary, because he is obliged to buy, often for an enormous price (which in Paris often amounts to from 200,000 to 300,000 francs, in smaller towns to 100,000 francs, and in small communes to 10,000 francs), from a notary who is about to retire, or from the heirs of a deceased notary, a study-room or office (*étude*), with the acts and documents belonging to it; for without such an office the mere appointment of notary is of little value. There are also established by law in France notarial chambers, which consist of a number of deputies, chosen by the notaries, who regulate the discipline among them, decide on the admission of candidates, adjust disputes which may arise among themselves, and hear and decide on the complaints of third persons against notaries, and the punishments of delinquent notaries.

Italy.—In Italy the French system of notaries has

been followed in its main features. In Germany, however, the notaries occupy but a subordinate position in most states, and it has been now almost generally established by law that only persons who have studied law for several years can be appointed as notaries.

England.—In England, notaries were known as public officers before the Norman Conquest, and at a very early period they were employed to attest and authenticate instruments of moment and solemnity. But whatever their duties and functions may have been in former times, at present they are described to be, by Richard Brooke, in his treatise on the office of a notary public of England, as follows: "In England a notary is a public officer of the civil and canon law, who derives his faculty or authority to practice from the Court of Faculties of the Archbishop of Canterbury, in London, the chief officer of which is the Master of the Faculties, to whom applications are made for the admission, or removal under any special circumstances, of notaries. In the Institutes of the Laws of England the Court of Faculties is stated to be 'a court, although it holdeth no plea of controversy (like the Court of Audience next before). It belongeth to the archbishop, and his officer is called *Magister ad Facultates*.'" The functions and powers of a notary in England are, to draw and prepare deeds relating to real and personal property, to note and protest bills of exchange, to prepare acts of honor, to authenticate and certify examined copies of documents, to prepare and attest instruments going abroad, to receive the affidavits or declarations of mariners and masters of ships, and to draw up their protests, and to solemnize all other notarial acts. "The expression *notarial act*," says Mr. Brooke, "is one which has a technical meaning, and it seems generally considered to signify the act of authenticating or certifying some document or circumstance by a written instrument, under the signature and official seal of a notary, or of authenticating or certifying as a notary some fact or circumstance by a written instrument, under his signature only." The English notaries have always considered themselves entitled to administer oaths, affidavits, and affirmations, as within the powers and functions of a notary; and the act of 5th and 6th William IV. has placed it beyond dispute. The requisitions for admission to the Faculty of Notaries in England are, an apprenticeship or clerkship of five years with a notary, a certificate from two notaries certifying to the candidate's skill and probity, and that he is a proper person to become a notary. Upon due proof of these facts, the Master of Faculties will admit him upon his taking the prescribed oaths, which are the oath of allegiance, the oath of supremacy, the oath of due service under the articles of clerkship and for the faithful exercise of the office of notary. A notary is liable to be struck off the Roll of Faculties for any malpractice or misconduct in his office, on a complaint made to the Master of the Faculties, and supported by affidavit or other proof.

United States.—In the United States the duties and functions of notaries resemble those of the same officers in England. They are appointed by the respective governors of the States for a limited number of years, or during good behavior, and derive their powers by the statute laws of the States; and in cases where these laws do not specify their powers—as, for instance, in Massachusetts—it must be presumed that all the powers which, by general usage, the custom of merchants, and law of nations are generally exercised by these officers, are also vested in them. We may state their general and customary functions to be, to demand acceptance and payment of foreign and inland bills of exchange and promissory notes, and to protest the same for non-acceptance and non-payment; to note and draw up ship protests, and all other protests which are customary according to the usage of merchants; and to exercise such other powers and duties as by the law of nations, and according to commercial usage, or

by the laws of any other state, government, or country, may be performed by notaries public. But although notaries public are generally considered as accredited officers in other countries, and affidavits sworn before and instruments authenticated by them are received in evidence in foreign courts, it is required by foreign courts that the consuls of the respective foreign states in which the document is to be used certify to the fact that the person whose signature and seal are affixed is a notary public duly appointed. This is, however, not necessary in a protest for the non-acceptance or non-payment of a bill of exchange. The laws of the different States of the Union, in some instances, give some peculiar powers to their notaries, and hence the laws of each State must be consulted in regard to them. The principal functions of an American notary are, to protest bills of exchange and promissory notes on their being dishonored, and, as a part of this function, to present and demand payment of these mercantile instruments. Although the notaries with us generally give notice of the dishonor of bills and notes to antecedent parties, it is not their duty to do so, unless made so by statute, or they undertake so to do as a part of their duty; and then they are liable for any negligence in the discharge of this duty.—See *Manual for Notaries*, 8vo. pp. 220, New York, 1857.

Notes, Promissory. See BANKING and BANKS.

Nova Scotia (Fr. *Acadia*), a British province, forming a peninsula, connected with the main land by an isthmus only 8 miles broad, having the Bay of Fundy on the one side, and Northumberland Strait on the other. It lies, including Cape Breton Island, between lat. 43° 25' and 46° N., and long. 59° 45' and 66° 30' W., and is bounded north by Northumberland Strait, which separates it from Prince Edward Island, northeast by the Gut of Canseau, flowing between it and the island of Cape Breton (which forms a part of the government of Nova Scotia), south and southeast by the Atlantic Ocean, west by the Bay of Fundy, and northwest by New Brunswick. Area, 18,746 square miles.

Its southeast coast is remarkable for the number and capacity of its harbors, there being no fewer than twelve ports capable of receiving ships of the line, and fourteen of sufficient depth for merchantmen, between Halifax and Cape Canseau, a distance of not more than 110 miles. The surface of Nova Scotia seldom rises to a height exceeding 600 feet above the level of the sea. A ridge of high land extends through the peninsula in a direction east to west, and, with less prominent hills and undulations, gives a pleasing variety to the scenery. The principal rivers of the province are the Annapolis and Shubenacadie; the latter rises in Grand Lake, Halifax County, and, after a rapid and circuitous course of over 50 miles, enters Cobequid Bay; by means of a canal this river forms a navigable communication from Halifax harbor to the Bay of Fundy. It is navigable for some distance. The rise and fall of the tide at the mouth is about 50 feet. The Annapolis, after a course of 75 miles, in which it receives the waters of Moose and Bear rivers, enters Annapolis Bay. It is navigable for large vessels 20 miles above Annapolis. At Pictou, the East, West, and Middle rivers, all three navigable for large vessels, enter the harbor. The Avon receives the waters of the St. Croix, Kennebec, and several others, and empties itself into the Bay of Mines; it is navigable to Windsor. The La Have, Mersey, and Medway; the Shelburne (which forms the fine harbor of that name); the Clyde, one of the most beautiful streams of Nova Scotia; the Tusket and its numerous tributaries; the St. Mary, which, at its embouchure, forms the fine harbor of St. Mary; the Maccan, Nappau, and Gaspereau; the Musquedoboit, Sale, and Jordan; these form but a few of numerous streams of Nova Scotia. The tide rises with astonishing rapidity in the Bay of Mines to the height of 75 feet, while on the south shore and in the Gulf of St. Lawrence it does not rise more than 6 feet. There

are but few large lakes; the largest is Lake Rosignol, about 30 miles in length; Lake George is another sheet of water of considerable size, and the entire peninsula is dotted over with innumerable small lakes. The mines and minerals of Nova Scotia, though but imperfectly explored, are known to be valuable. Granite, trap, and clay-slate rocks predominate. The most abundant variety is the gray granite, which prevails along the shore, and is well adapted for mill-stones. Clay slate, of fine quality, is of extensive formation in the eastern section of the province, and graywacke slate along both shores of Chedabucto Bay. Several extensive and beautiful grottoes are to be found on different parts of the coast; and grindstones of superior quality are obtained from a stratum of sandstone, found between the coal and limestone. Coal, and iron in combination with it, abounds in many places. Copper ore also exists, but the attempts to work it have been hitherto unsuccessful; gypsum is plentiful, and furnishes an active and profitable trade. The soils of Nova Scotia are various; along the south shore the granite forms the basis, extending in many places 20 miles into the interior. This region is the least fertile, but there are elsewhere extensive alluvial tracts producing the most abundant crops. Many fine fertile districts, also, are met with on the north coast, along the banks of rivers and the heads of bays. The climate of Nova Scotia is affected by its almost insular position, and is characterized by a remarkable salubrity. The springs are tedious, but the summer heats being for a brief season excessive, vegetation is singularly rapid, and the autumn is delightful. The thermometer ranges from 18° to 70°. It is estimated that about 7,000,000 acres are still covered with primeval forests. There were in this province in 1851, 40,012 acres of diked land, and 799,310 acres of other improved land.

Live Stock.—Horses, 28,789; neat cattle, 156,857; milch cows, 86,856; sheep, 282,180; swine, 51,533.

Agricultural Products, etc.—Wheat, 297,157 bushels produced; rye, 61,438; Indian corn, 37,475; oats, 1,384,437; peas and beans, 21,638; barley, 196,037; buckwheat, 170,310; potatoes, 1,986,789; pounds of butter made, 3,613,890; of cheese, 652,069; of maple sugar, 110,441; hay, 287,887 tons made; grass seeds, 3686 bushels; and were made 89,976 gallons of malt and distilled liquors. Nova Scotia, however, does not yet supply her population with bread, even in good seasons; large importations of fine flour being yearly made from the United States. The apple orchards of the western counties are very productive. Apples and cider are annually exported, and the domestic supply is cheap and abundant. Cattle and sheep are raised in considerable numbers, and are exported both to New Brunswick and Newfoundland; but the breeds are inferior, and little attention is paid to their improvement. The cod and haddock fisheries are actively prosecuted all along the south coast. Mackerel and herrings are also taken in great quantities; but the salmon fishing has greatly fallen off, from the erection of grist and saw mills on the streams. The fisheries employed, in 1851, 812 vessels, with an aggregate of 43,333 tons, manned by 3681 men, and 5161 boats, manned by 6713 men; the catch amounted to 1669 barrels of salmon, 3536 of shad, 100,047 of mackerel, 53,200 of herrings, and 542 barrels of alewives; total value of fisheries, £217,220; and there were manufactured 189,250 barrels of fish-oil, valued at £17,754. Several attempts have been made to prosecute the whale and seal fisheries, but hitherto with no great success. The manufactures of Nova Scotia are yet but very limited. Coarse cloths, called "homespun," are made, and are generally worn by the farmers, fishermen, etc. There were in this province, in 1851, 81 woolen factories, employing 119 persons, and 11,096 hand-looms, producing 119,698 yards of filled cloth, 790,104 yards not filled, and 219,352 yards flannel; total value, £36,178; 9 iron foundries, employing 138 persons, making castings, etc.,

timated at 470 miles, and average breadth at 56 miles. It consists of two islands, separated by the channel Matotshkin-shar. Surface on the western side rises generally to 2000 feet, and in some places to from 3200 to 3500 feet above the sea; but the eastern shores are comparatively low and barren. Black clay-slate and limestone are the principal constituent rocks, as in the Ural chain, of which Nova Zembla may be considered an insular continuation. Its coasts are frequented by walrus hunters in summer, but nowhere permanently inhabited. Subterranean stone labyrinth of great antiquity have been discovered here.

Nut, or Hazel-nut (Germ. *Haseknusse*; Fr. *Noisettes*, *Avellines*; It. *Naccinole*, *Avellane*; Sp. *Avellanas*; Port. *Avelladas*; Lat. *Avellana*), the fruit of different species of *Coryli*, or hazels. The kernels have a mild, farinaceous, oily taste, agreeable to most palates. A kind of chocolate has been prepared from them; and they have sometimes been made into bread. The expressed oil of hazel-nuts is little inferior to that of almonds. Besides those raised at home, we import nuts from different parts of France, Portugal, and Spain, but principally from the latter. The Spanish nuts in the highest estimation, though sold under the name of Barcelona nuts, are not really shipped at that city, but at Tarragona, a little more to the south. Mr. Inglis says that the annual average export of nuts from Tarragona is from 25,000 to 30,000 bags, of four to the ton.

Nuts (Ground) (*Arachis hypogæa*), known in French commerce as "*arachides*," in America as peanuts, and in Africa as *Mandubim*, the fruit of a papilionaceous plant, rising to the height of about 15 inches, being very like the field pea, with yellow flowers. The branches, after flowering, bend down till they touch the ground, into which they work themselves, and upon them grow the pods that contain the nuts. When the nuts are ripe the plant dies. It is then pulled up, and the nuts which adhere to the twigs are collected. The pods, which are of an elongated figure, about three quarters of an inch in length, and half an inch in circumference, and brittle, usually contain two nuts, but sometimes only one, and very rarely three. They are elliptical at one end and flattened at the other. Ground-nuts are grown in light, sandy soils in most tropical countries. They have been used as food from time immemorial in Africa, India, Brazil, and other parts both of South and North America. The best are raised on the banks of the River Gambia, where they are extensively grown in large fields, the ground being prepared for their reception by the natives after the rude fashion of the country. The plant is very prolific; it is also said to be highly exhaustive of the soil, though this is perhaps questionable. Ground-nuts yield large quantities of oil; and within the last 20 years they have begun to be grown in Africa as an article of commerce, and are now largely exported for crushing. A mill for expressing oil from them was constructed in London in 1835. But the French Government having a few years after imposed high duties on most descriptions of oil seeds, the oil-crushers of Marseilles and other towns endeavored to find out seeds not included in the tariff, or less heavily taxed than the others. They were thus led to import *arachides* or ground-nuts, which they found to answer extremely well. France has, in consequence, become the great market for this peculiar product. The exports from the Gambia, which in 1835 did not exceed 47 tons, had increased in 1851 to not less than about 12,000 tons. Of this quantity about 800 tons went to the United States (where they are eaten at dessert, roasted, as are chestnuts elsewhere), 700 tons to England, and the rest to France, principally to Marseilles. The total imports of *arachides* into France in 1851 amounted, according to the official returns, to 16,472,562 kilogrammes, or 16,180 tons.

Nuts are also exported from the Rio Grande, the

Rio Nunez, and from Sierra Leone, and the adjoining rivers. And though there are no accounts of the exact quantities sent from each, it is believed that their aggregate amount is fully equal to the exports from the Gambia. Within the last three or four years considerable quantities have been shipped from the Senegal River. The oil expressed from the nuts differs in quality and price according to the care with which it is refined. That made in London, which is equal to fine olive oil, sold, in 1853, at from £60 to £62 a ton. In France the oil is principally used in the manufacture of soap; and being inferior to the former, is only worth from £45 to £48 a ton. Besides being used for the like purposes as other oil in food, in the woolen manufacture, and in lamps, the oil of ground-nuts is said to be especially well fitted for lubricating heavy machinery, including the locomotive engines on railways. The Belgians use it for this latter purpose in preference to all other oils. Ground-nuts are worth at present (September, 1853) from 380 francs to 390 francs per 1000 kilogrammes (a ton) in Marseilles; £13 15s. a ton in London; and from £9 to £10 a ton delivered to a French ship in the Gambia. Sierra Leone nuts bring from £1 to £2 less than those from the Gambia.

Nutmeg (Ger. *Muskatennüsse*; Du. *Muskaät*; Fr. *Muscades*, *Noix muscades*; It. *Noce muscada*; Sp. *Moscada*; Arab. *Jowzaleib*; Sans. *Jatiphala*; Malay, *Buah-pala*), the fruit of the genuine nutmeg-tree (*Myristica Moschata*), a native of the Moluccas, but which has been transplanted to Sumatra, Penang, etc. An inferior and long-shaped nutmeg is common in Borneo; but the fruit nowhere attains to the same perfection as in the Moluccas. Of the several varieties of the tree, that denominated the Queen Nutmeg, which bears a small, round fruit, is the best. The kernel, or proper nutmeg, is of a roundish oval form, marked on the outside with many vermicular furrows, within of a fleshy, farinaceous substance, variegated whitish and bay. Nutmegs are frequently punctured and boiled, in order to obtain the essential oil, the orifice being afterward closed; but the fraud is easily detected by the lightness of the nutmeg.—*Thomson's Dispensatory*; *Ainslie's Materia Indica*. Nutmegs should be chosen large, round, heavy, and firm, of a lightish gray color on the outside, and the inside beautifully marbled, of a strong fragrant smell, warm aromatic taste, and a flat, oily body. They are very subject to be worm-eaten. The best manner of packing them is in dry chunam. The oblong kind, and the smaller ones, should be rejected. 15 cwt. are allowed to a ton.—*Milburn's Orient. Com.* The dried produce of a nutmeg-tree consists of nutmeg, mace (which see), and shell. Supposing the whole produce to be divided into 100 parts, there are 18½ of mace, 33½ of shell, and 58½ of nutmeg. In the ancient commerce, and down to the establishment of the Dutch monopoly, nutmegs were always sold and exported in the shell. The natives, whenever the commerce is left to their management, continue the practice, which is strongly recommended by Mr. Crawford.—*Eastern Archipelago*, vol. iii. p. 386.

The jealous policy of the Dutch has reduced the trade in nutmegs to a mere trifle, compared to what it would otherwise have been. They have, in so far at least as it was possible, exerted themselves to exterminate the nutmeg plants every where except in Banda. The aboriginal inhabitants of this island have been expatriated, and the land parceled among settlers from Holland, under the name of *park-keepers*. These persons have about 2000 slaves, who cultivate and prepare the nutmegs. The prices paid by the cultivator are all fixed by Government; and it deserves to be mentioned, as affording one of the most striking illustrations of the ruinous effects of monopoly, that the fixed price which the Government is now obliged to pay for nutmegs is *five times greater than the price at which they bought them when the trade was free!* We can not

conceive how so enlightened and liberal a Government as that of Holland should continue to tolerate such scandalous abuses, more especially since it has established a free system in Amboyna, Java, and its other possessions. M. Temminck estimates the produce of the Banda Islands at about 600,000 pounds of nutmegs, and 160,000 pounds of mace.—*Possessions Néerlandaises dans l'Inde Archipelagique*, iii. 283. During the period that the English had possession of the Spice Islands, nutmeg plants were carried to Penang, Bencoolen, and some of the West India islands. In the latter they have altogether failed, at least as far as respects any useful purpose; but very good nutmegs, and in considerable quantities, are now raised at Penang and Bencoolen. Mr. Crawford, however, alleges that the cost of bringing them to market is there so high, that the restoration of a free culture in the native country of the nutmeg would instantly destroy this unstable and factitious branch of industry.—*Eastern Archipelago*, vol. iii. p. 409. See *American Journal of Science*, xii. 322.

STATEMENT SHOWING THE IMPORTS OF NUTMEGS INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1865.

Whence imported.	Pounds.	Value.
Hamburg	1,275	\$851
Holland	259,200	153,539
Dutch West Indies	3,970	1,908
Dutch East Indies	37,513	18,520
Belgium	11,475	5,552
England	67,923	41,765
British West Indies	456	157
British East Indies	193,881	88,566
France on the Atlantic	18,598	9,941
Hayti	115	61
China	400	233
Total	594,818	\$326,133

Nutria, or Neutria, the commercial names for the skins of *Myopotamus Bonariensis* (Commerson), the *Coyou* of Molina, and the *Quoiya* of D'Azara. In France, the skins were, and perhaps still are, sold under the name of *raccoonda*; but in England they are imported as *nutria* skins—deriving their appellation most probably from some supposed similarity of the animal which produces them, in appearance and habits, to the otter, the Spanish name for which is *nutria*. Indeed, Molina speaks of the *coyoyou* as a species of water rat, of the size and color of the otter. Nutria fur is largely used in the hat manufacture, and has become within the last 15 or 20 years an article of very considerable commercial importance. The imports

fluctuate considerably. In 1841 they amounted to 1,125,212 skins; but in some years they are much less; and in 1840 amounted to only 242,733. Those entered for home consumption pay a duty of 1s. per 100 skins. They are principally brought from the Rio de la Plata.—See FUR TRADE.

The *coyoyou* or *quoiya* is a native of South America, very common in the provinces of Chili, Buenos Ayres, and Tucuman, but more rare in Paraguay. In size it is less than the beaver, which it resembles in many points. The head is large and depressed, the ears small and rounded, the neck stout and short, the muzzle sharper than that of the beaver, and the whiskers very long and stiff. There are, as in the beaver, two incisor teeth, and eighteen molar, above and below—twenty teeth in all. The limbs are short. The fore feet have each five fingers not webbed, the thumb being very small; the hind feet have the same number of toes; the great toe and three next toes being joined by a web which extends to their ends, and the little toe being free, but edged with a membrane on its inner side. The nails are compressed, long, crooked, and sharp. The tail, unlike that of the beaver, is long, round, and hairy; but the hairs are not numerous, and permit the scaly texture of the skin in this part to be seen. The back is of a brownish red, which becomes redder on the flanks; the belly is of a dirty red. The edges of the lips and extremity of the muzzle are white. Like the beaver, the *coyoyou* is furnished with two kinds of fur; viz., the long, ruddy hair which gives the tone of color, and the brownish ash-colored fur at its base, which, like the down of the beaver, is of much importance in hat-making, and the cause of the animal's commercial value. The *coyoyou* is easily domesticated, and its manners in captivity are very mild.

Nux Vomica (Fr. *Noix Vomique*; Hind. *Kaach-la*), the fruit of a species of *Strychnos*, growing in various places in the East Indies. The fruit is about the size of an orange, covered with a smooth, crustaceous, yellow bark, and filled with a fleshy pulp, in which are imbedded several orbicular, flattened seeds, about three quarters of an inch in diameter. *Nux vomica* is inodorous, and has a very bitter, acrid taste, which remains long on the palate. It is known as a very virulent poison. A suspicion has, however, been entertained that it has been used in porter breweries; but its introduction into them is prohibited under heavy penalties.—*Thomson's Dispensatory, etc.*

O.

Oak (Ger. *Eiche*; Du. *Eik*; Dan. *Eeg*; Swed. *Ek*; Fr. *Chêne*; It. *Quercia*; Sp. *Roble*, *Carballo*; Port. *Roble*, *Carbalho*; Russ. *Dub*; Pol. *Dab*; Lat. *Quercus*; Arab. *Baalut*). There are several varieties of this valuable tree; but the common English oak (*Quercus robur*) claims precedence of every other. The knotty oak of England, the "unwedgedable and gnarled oak," as Shakspeare called it, when cut down at a proper age (from 50 to 70 years), is the best timber known. Some timber is harder, some more difficult to rend, and some less capable of being broken across, but none contains all the three qualities in so great and equal proportions; and thus, for at once supporting a weight, resisting a strain, and not splintering by a cannon shot, the timber of the oak is superior to every other.

A fine oak is one of the most picturesque of trees; it conveys to the mind associations of great strength, and of all but endless duration. It stands up against the blast, and does not take, like other trees, a twisted form from the action of the winds. Except the Cedar of Lebanon, no tree is so remarkable for the stoutness of its limbs; they do not exactly spring from the trunk, but divide from it; and thus it is sometimes difficult to know which is stem and which is branch. The twisted branches of the oak, too, add greatly to its

beauty; and the horizontal direction of its boughs, spreading over a large surface, completes the idea of its sovereignty over all the trees of the forest. Even a decayed oak, such as that described by Spenser:

"————— dry and dead,
Still clad with reliques of its trophies old,
Lifting to heaven its aged, hoary head,
Whose foot on earth has got but feeble hold,"

is strikingly beautiful. To such an oak Lucan compared Pompey in his decline:

"Qualis frugifero quercus sublimis in agro
Exuvius veteres populi, sacraque gestans
Dona duem; nec jam validis radicibus herens,
Pondere fixa suo est; nudosque per aëra ramos
Effundens, trunco, non frondibus, efficit umbram.
At quamvis primo nutet casura sub Euro,
Tot circum silvæ firmo se robore tollant,
Sola tamen colitur."—(Lib. i. lin. 186.)

The oak is raised from acorns, sown either where the oak is to stand, or in a nursery, whence the young trees are transplanted. The color of oak wood is a fine brown, and is familiar to every one; it is of different shades; that inclined to red is the most inferior. The larger transverse septa are in general very distinct, producing beautiful flowers when cut obliquely. Where

the septa are small, and not very distinct, the wood is much the strongest. The texture is alternately compact and porous; the compact part of the annual ring being of the darkest color, and in irregular dots surrounded by open pores, producing beautiful dark veins in some kinds, particularly pollard oaks. Oak timber has a particular smell, and the taste is slightly astringent. It contains gallic acid, and is blackened by contact with iron when it is damp. The young wood of English oak is very tough, often cross-grained, and difficult to work. Foreign wood, and that of old trees, is more brittle and workable. Oak warps and twists much in drying, and, in seasoning, shrinks about 1-32d of its width. Oak of a good quality is more durable than any other wood that attains a like size. Vitruvius says it is of eternal duration when driven into the earth: it is extremely durable in water; and in a dry state it has been known to last nearly 1000 years. The more compact it is, and the smaller the pores are, the longer it will last.

Remarkable Oaks.—The oldest oak in England stands in the most ancient park, belonging to the Duke of Portland. It is called the Parliament Oak, for it is said that Edward I. held a Parliament under its branches. It is supposed to be 1500 years old. Another remarkable oak is at Welbeck Abbey, in Nottinghamshire, which is famous for its oaks. This tree is called "The Duke's Walking-stick." It is 112 feet high. Three others of these noble trees claim attention for their extraordinary size and longevity, of which the Greendale Oak is the largest. Through its trunk a coach road is cut, and its branches cover a space of 700 square yards. The Two Porters, standing near one of the park entrances, are each 100 feet high; the third is called the Seven Sisters, from its having seven stems rising 90 feet in height from the trunk. The Cathorpe Oak, in Yorkshire, is noted as being the largest oak in England. Its girth is 78 feet.—*The Half Holiday.*

The supply of oak timber in this country is plentiful, but not inexhaustible, and care should be taken to preserve the forests, and, by a judicious use of the timber, avoid the great waste that has been going on; for upon a supply of this lumber depends, in a measure, our success as a maritime nation. Though some prejudice has existed in Europe against the quality of our oak timber, it is now conceded by all to be unsurpassed. By means of the Mississippi River and its tributaries we are enabled to use with advantage the oak forest on the western slope of the Alleghanies, and even in the forest of Michigan, and the West will soon be a rival to the East in ship-building. Kentucky especially abounds in the finest oak forests, as yet unmolested, but destined to add greatly to our wealth.—*See SHIP and SHIP BUILDING.*

Gall-nut Oak (*Quercus infectoria*), a native of Persia, Asia Minor, Arabia, Egypt, Morocco, and Algeria, in its natural habitat, is an evergreen shrub, with a very crooked stem, and seldom attains six feet in height. From the circumstance of its growing near Paris, where it bears the winter quite well in the open air, though losing its leaves in the autumn, it doubtless would be adapted to the climate of our Middle and Southern States. On this shrub is found the well-known "gall-nuts" of commerce, which are extensively used in the manufacture of writing-ink and in dyeing. These excrescences are the product of the gall-fly (*Cynips scriptorum*), a small insect of a dale-brown color, which may often be found inclosed in the galls sold in the shops of the druggists, collected before the fly had made its escape. There are two kinds of gall-nuts known in commerce; those which still contain the insect, and are known in the trade under the names of "Black," "Blue," or "Green" galls, termed *yerly* by the natives of the country in which they are collected; and those from which the insect has escaped, and which are called "White" galls. The latter con-

tain not more than two-thirds of the astringent qualities of the former, and are of a pale-brown or whitish color, being not so heavy and less compact.

The *Agilops*, or *Valonia Oak* (*Quercus agilops*), is indigenous to the islands of the Archipelago, and, indeed, to all Greece, and often grows to a height of fifty or sixty feet. It is perfectly hardy in the climate of England, from which it may be inferred that it also would grow in favorable localities in our Middle and Southern States. The cups and acorns of this tree are annually conveyed to Europe, where they are in great demand for tanning, and are believed to contain more tannin than any other vegetable, in proportion to their bulk. These acorns, which are commonly called "Valonia," form a very considerable article of export of the Morea and the Levant, being worth in England from \$60 to \$70 a ton. The more substance there is in the husks, or cups, of these acorns the better. They are of a bright-drab color, which they preserve as long as they are kept dry; but dampness injures them, as they turn black, and become impaired, both in quality and strength. A kind of gall is found on this tree somewhat similar to that on the *Quercus infectoria*, and which is employed for the same purposes. These galls are rugose, of an angular form, and are either the fruit itself, distorted by the puncture of the insect (*Cynips quercus calycis*), or merely the scaly cup which is enlarged into a gall.

Oakum, the substance into which old ropes are reduced when they are untwisted, loosened, and drawn asunder. It is principally used in calking the seams, tree-nails, and bends of a ship, for stopping or preventing leaks.

Oar, a long piece of timber, long at one end, and round or square at the other, used to make a vessel advance upon the water. The flat part, which is dipped into the water, is called the *blade*, and that which is within the board is termed the *loom*, whose extremity, being small enough to be grasped by the rowers, is called the *handle*. To push the boat or vessel forward by means of this instrument, the rowers turn their backs forward, and, dipping the blade of the oar in the water, pull the handle forward, so that the blade, at the same time, may move aft in the water. But, since the blade can not be so moved without striking the water, this impulsion is the same as if the water were to strike the blade from the stern toward the head; the vessel is therefore necessarily moved according to the direction. Hence it follows that it will advance with the greater rapidity by as much as the oar strikes the water more forcibly; consequently, an oar acts upon the side of a boat or vessel like a lever of the second class, whose fulcrum is the station upon which the oar rests on the boat's gunwale.

Oats (Ger. *Hafer*; Du. *Haver*; Dan. *Havre*; Swed. *Umfre*; Fr. *Avoine*; It. *Vena*, *Avena*; Sp. *Avena*; Port. *Avena*; Russ. *Oves*; Pol. *Owies*), a species of grain, the *Avena sativa* of botanists. There are innumerable varieties of this grain. It is the hardiest of all the cereal grasses, growing luxuriantly in cold northern climates, and in coarse mountainous districts, where neither wheat nor barley can be advantageously cultivated. It thrives best, and is, indeed, chiefly raised, in northern latitudes; being but little known in the south of Europe. In Scotland it forms a large part of the food of the people, and is far more generally cultivated than any other species of grain. There are four leading varieties of this grain cultivated; viz., white, black, gray, and brown or red oats. The sub-varieties of the white are numerous. That denominated the potato oat is at present almost the only one raised on land in a good state of cultivation in the north of England and the south of Scotland, and usually brings a higher price in the London market than any other variety. It was accidentally discovered growing in a field of potatoes in Cumberland in 1788; and from the produce of that single stalk has been obtained the stock

now in general cultivation. Black and gray oats are little cultivated, except in some places in the north of Scotland. The red oat is chiefly confined to Cheshire, Derbyshire, and Staffordshire. A species of naked oats, provincially called *pillar*, is raised in Cornwall.—*London's Encyclopedia of Agriculture*; *Brown's Rural Economy*.

The oat, when considered in connection with the artificial grasses and the nourishment and improvement it affords to live stock, may be regarded as one of the most important crops we produce. Its history is highly interesting, from the circumstance that, while in many portions of Europe, when ground into meal, it forms an important aliment for man, one sort at least has been cultivated from the days of Pliny on account of its superior fitness as an article of diet for the sick. The country of its origin is somewhat uncertain, though the most common variety is said to be indigenous to the island of Juan Fernandez. Another oat, resembling the cultivated variety, is also found growing wild in California. This plant was introduced into the North American colonies soon after their settlement by the English. It was sown by Gosnold, on the Elizabeth Islands, in 1602; cultivated in Newfoundland in 1622, and in Virginia, by Berkeley, prior to 1648.

The oat is a hardy grain, and is suited to climates too hot and too cold either for wheat or rye. Indeed, its flexibility is so great, that it is cultivated with success in Bengal, as low as latitude 25 degrees north, but refuses to yield profitable crops as we approach the equator. It flourishes remarkably well when due regard is paid to the selection of varieties, throughout the inhabited parts of Europe, the northern and central portions of Asia, Australia, Southern and Northern Africa, the cultivated regions of nearly all North America, and a large portion of South America.

In this country the growth of the oat is confined principally to the Middle, Western, and Northern States. The varieties cultivated are the common white, the black, the gray, the imperial, the Hopetown, the Polish, the Egyptian, and the potato oat. The yield of the common varieties varies from forty to ninety bushels and upward per acre, weighing from twenty-five to fifty pounds to the bushel. The Egyptian oat is cultivated south of Tennessee, which, after being sown in autumn and fed off by stock in winter and spring, yields from ten to twenty bushels per acre. In the manufacture of malt and spirituous liquors oats enter but lightly, and their consumption for this purpose does not exceed sixty thousand bushels annually in the United States. It will be seen by the following exhibit that New York, Pennsylvania, Ohio, Virginia, and Illinois are the largest producers of oats, and in the order in which they are here placed.

PRODUCTION OF OATS IN THE UNITED STATES DURING THE YEAR 1850.

		Total bushels	146,678,890

The oat, like rye, never has entered much into our foreign commerce, as the domestic consumption has always been nearly equal to the quantity produced. The annual average exports, for several years preceeding

1817, were seventy thousand bushels. By the Census returns of 1840, it will be seen that the total produce of the United States was 123,000,000 bushels; of 1850, 146,678,890 bushels.—*United States Patent Office Report*.

A few years since the oat crop of the Western States sold at 80 or 40 cents per bushel. At the present time (October, 1856), owing to the larger number of horses employed in the West and the East, the price is steady at 40 to 60 cents in the West; and 45 to 50 cents in the States of New England and New York.

Observatories. The first is supposed to have been on the top of the temple of Belus, at Babylon. On the tomb of Osymandias, in Egypt, was another, and it contained a golden circle 200 feet in diameter: that at Benares was at least as ancient as these. The first in authentic history was at Alexandria, about 300 B.C. The first in modern times was at Cassel, 1561. The Royal Observatory at Greenwich was founded by Charles II. A.D. 1675; and from the meridian of Greenwich all English astronomers make their calculations.

S. 295; *Edinburgh Review*, xci. 159; *Southern Literary Messenger*, xiv. 4 (Lieutenant MAURY), xv. 304; Professor LOOMIS'S "Recent Progress of Astronomy," New York, 1850.

Ocean (Gr. *ωκεανος*.) In Geography, the vast body of water which surrounds the continents, and is the receptacle of all their running waters. It is divided by geographers into five great basins; viz., the Pacific Ocean (so called by reason of its comparative stillness, which separates Asia from America, and is the largest of all the basins; 2. The Atlantic Ocean, which has Europe and Africa on its eastern shore, and America on its western; 3. The Indian Ocean, which washes the south of Asia, and the south-eastern coast of Africa; 4. The Arctic Ocean, which surrounds the north pole; and, 5. The Antarctic, which surrounds the south pole. Other smaller portions of the great connected body of water are called *seas*, of which the Mediterranean, the German, the Baltic, and Black seas, are the most considerable. The superficial extent of the several great basins is not known with any certainty, nor, indeed, can their limits be exactly defined. From the nearest estimation that can be made of the extent of the continents and principal islands, it is supposed that nearly three-fourths of the whole surface of the globe are covered by water. The Pacific Ocean alone exceeds the whole surface of the dry land.

Depth of the Ocean.—If the superficial extent of the ocean can not be easily ascertained, it will readily

be supposed that its depth is a problem of much greater difficulty. The bottom appears, wherever it has been reached by the sounding-line, to have similar inequalities to those of the surface of the land: hence the depth must be extremely various; and it might be supposed from analogy that the greatest depth of the ocean is at least equal to the height of the highest mountains above its surface. Lord Mulgrave found no bottom in the North Atlantic Ocean with a sounding-line of 4680 feet, and Mr. Scoresby sounded to the depth of 7200 feet without the lead touching the ground. These experiments are not altogether to be depended on for the determination of such great depths; for, the pressure becoming very great, the lead may be drawn out of the perpendicular direction by currents, of which it may encounter more than one, flowing in different directions. Over a great portion of the Atlantic and Pacific oceans no bottom has been found. The depth of the ocean, in general, and the form of the bed on which it rolls, can not, therefore, be determined by experiment. The mathematical theory of the oscillations of fluids has, however, thrown some light on the subject. Laplace demonstrated that the difference which is indicated by observation between the height of two consecutive tides depends on the law of the depth of the sea, and that, but for the influence of accessory circumstances, it would disappear altogether if the depth were constant. It follows, therefore, that, since the difference between the consecutive tides is extremely small, the depth of the sea, taking in a large extent of ocean, must be nearly uniform; that is to say, there must be a certain mean depth from which the variations are not considerable.—*Méc. Céleste*, book xiii.

Level of the Ocean.—Were it not for the disturbing actions of the sun and moon, and of the winds, the level of the ocean would be every where the same, and its surface would have the form determined by the attraction of the whole mass of the earth, combined with the centrifugal force belonging to its velocity of rotation; that is to say, the surface would be that of an oblate spheroid of revolution. This uniformity, however, can never be established. The tide at every instant is at different heights in different parts of the ocean; and therefore the form of the surface, within the limits of the rise and fall of the tides, is variable. But even if we neglect the alternate rise and fall of the water which constitutes the tides, and take the surface of the ocean at its mean height, it is found by accurate leveling that all its parts do not coincide with the surface of the same spheroid. Gulfs and inland seas, which communicate with the ocean by narrow openings, are affected according to their position with regard to the prevailing winds. The level of the Red Sea was found, by the French engineers in Egypt, to be 32½ feet higher than that of the Mediterranean, which is supposed to be a little lower than the ocean. Humboldt concluded, from observations made on the Isthmus of Panama, that the waters of the Gulf of Mexico are about two feet higher than those of the Pacific Ocean. The Baltic and Black seas rise in spring from the great quantity of river water poured into them, and are lowered in summer by the joint effects of a small supply and increased evaporation.

Color of the Ocean.—The usual color of the ocean is a bluish green, of a darker tint at a distance from land, and clearer toward the shores. According to Mr. Scoresby, the hue of the Greenland Sea varies from ultramarine blue to olive green, and from the purest transparency to great opacity. The surface of the Mediterranean, in its upper part, is said to have at times a purple tint. In the Gulf of Guinea the sea sometimes appears white; about the Maldives Islands black; and near California it has a reddish appearance. Various causes co-operate to produce this diversity of tint. The prevailing blue color may be ascribed to the greater refrangibility of the blue rays of light,

which, by reason of that property, pass in greatest abundance through the water. The other colors are ascribed to the existence of vast numbers of minute animalculæ; to marine vegetables at or near the surface; to the color of the soil; the infusion of earthy substances; and very frequently the tint is modified by the aspect of the sky. The phosphorescent or shining appearance of the ocean, which is a common phenomenon, is also ascribed to animalculæ, and to semi-putrescent matter diffused through the water.

Temperature of the Ocean.—Water being a slow conductor of heat, the temperature of the ocean is much more uniform than that of the atmosphere. At a certain distance from the equator, it follows, though not very closely, the mean temperature of the corresponding latitudes, the solar action being greatly modified by the existence of currents which convey the temperature of one region to another; so that at any place the temperature of the water depends, in some measure, on the direction of the currents. Within the tropics the mean temperature at the surface is about 80° of Fahrenheit, and generally ranges between 77° and 84°. At great depths the temperature is probably nearly the same under every latitude. In the torrid zone it is found to diminish with the depth; in the polar seas it increases with the depth; and about the latitude of 70° it is nearly constant at all depths. But the small number of observations which have yet been made on this subject do not indicate any uniform law, according to which the variations of temperature at different depths is regulated.

Saltness of the Ocean.—The ocean holds in solution a variety of saline matters, of which by far the most abundant is common salt, constituting, in general, about two-thirds of the whole. The saltness of sea-water at particular places is influenced by temporary causes—storms, for example; as well as by the neighborhood of large rivers, and permanent accumulations of ice. A series of experiments on this subject were made some years ago by the late Dr. Marcet, and the following are the general conclusions which he deduced from them: 1. That the Southern Ocean contains more salt than the Northern Ocean, in the ratio of 1·02919 to 1·02757. 2. That the mean specific gravity of sea-water near the equator is 1·02777. 3. That there is no notable difference between sea-water under different meridians. 4. That there is no satisfactory evidence that the sea at great depths is more salt than at the surface. 5. That the sea, in general, contains more salt where it is deepest, and that its saltness is always diminished in the vicinity of large masses of ice. 6. That small inland seas, though communicating with the ocean, are much less salt than the ocean. 7. That the Mediterranean contains rather larger proportions of salt than the ocean.—*Philosophical Transactions*, 1819; *PROUT'S Bridgewater Treatise*; *BRANDE'S Dictionary*. The peculiar bitter taste of sea-water does not appear to belong to it beyond a certain depth, and is ascribed to the vegetable and animal matter held in a state of decomposition near the surface.—*See TIDES, ATLANTIC OCEAN, GULF STREAM, AND SOUNDINGS; Massachusetts Quarterly*, ii. 208; *American Journal of Science*, v. 128, v. N. S. 41; *Foreign Quarterly*, xiv. 369.

Oceanica. Geographers have divided "Oceanica" into three distinct portions; viz., Malaysia, Australasia, and Polynesia. So comparatively little is known of its component parts, that it is only possible to state the statistics of such countries as most frequently come under the notice of civilized nations, and this is done in the annexed accounts:

1. *Malaysia.*—This portion includes most of the islands of the Indian Archipelago, and has its name from the fact that the Malay race are its most prominent inhabitants. Malaysia is naturally composed of five grand divisions.

1. Sumatra, Java, Bali, Sumbawa, and about two-thirds of the western portion of Borneo as far as 116°

E. long.; 2. Celebes, with the smaller islands about its coast, and the eastern portion of Borneo up to 3° N. lat.; 3. The Spice Islands; 4. The Soo-Joo Archipelago, Mindanao, and the northeast corner of Borneo; and, 5. The Philippine Islands.

These several divisions are peculiar in physical formation, in climate, productions, and inhabitants.

II. *Australasia* extends from 1° N. to 55° S. lat., and from 112° to 180° E. long., and its components are, Australia or New Holland, Van Diemen's Land, New Zealand, Papua or New Guinea, New Britain, New Ireland, the Arru Islands, Solomon Islands, New Caledonia, New Hebrides, Queen Charlotte's Islands, New Hanover, Admiralty Islands, and many smaller islands scattered over the intervening seas.

III. *Polynesia* includes the numerous groups of islands scattered over the Pacific between Asia, Malaysia, and Australasia on the west and southwest, and the western coast of America. The following is the most approved classification of these groups: the Bonin or Arzobispo Islands, the Ladrone or Marian Islands, the Caroline Islands, the Feejee Islands, the Tonga or Friendly Islands, Navigator's or Samoa Islands, Cook's or the Hervey Islands, the Society, Georgian, and Low Islands, the Austral Islands, the Marquesas and Washington Islands, the Hawaiian or Sandwich Islands, the Kermadec Isles, and scattered and isolated islands, among which are Gambier Islands, Pitcairn Island, etc. The *Malaysian*, with the exception of the Philippine Islands, belong chiefly to Holland, and, according to the latest official reports, the following are the statistics of the Dutch possessions: The superficies of Netherlands India is 27,892 square geographical, or 36,887 American miles. The population of Java and Madura, exclusive of the army, is 9,584,130; viz., Europeans, etc., 16,409; Chinese, 119,481; other easterns, 27,687; and natives, 9,420,553. Sumatra has 3,430,000 inhabitants; Banka and dependencies, 50,000; Rhio and dependencies, 30,000; Borneo and dependencies, 1,200,000; Celebes, 300,000; Molucca Islands and dependencies, 718,500; Timor and dependencies, 800,000; Bali and Limbok, 1,205,000. Total, 10,473,500. Total population of Dutch India, 20,037,630. Great Britain is the first power in *Australasia*. The statistics of the following colonies refer to the commencement of the year 1851:

Colonies.	Population.	Value of Imports. £	Value of Exports. £	Tonnage entered.
New South Wales.....	192,000	2,078,338	2,339,580	234,215
Victoria.....	77,360			
South Australia.....	67,430	845,572	570,816	86,583
West Australia.....	5,886	52,851	22,134	15,988
Van Diemen's Land	70,130	1,232,272	1,172,530	23,031

Of the exports, as above, the following is the value of wool from each colony in 1850: New South Wales and Victoria, £1,614,241; South Australia, £131,730; West Australia, £15,482; and Van Diemen's Land, £451,203. The value of minerals, chiefly copper, from South Australia in the same year was £362,568. Since the above returns gold has been discovered in Australia, and the fields have been more productive than those of California. The quantity yielded in the year ending 30th December, 1852, was 3,998,321 ounces, valued at over £15,000,000, or \$75,000,000. The population and every interest has increased, and perhaps doubled, under the stimulating influence of this shower of gold. Among the islands of *Polynesia* the Sandwich Islands hold the first rank, whether viewed in relation to their position, products, population, or civilization. The population in January, 1849, was 80,641. The excess of deaths over births in 1848 had been 6465, or 8 per cent. About 10,000 died of measles and hooping-cough in 1847-'8. At this rate of mortality the population in 1860 would be 32,224; in 1870, 14,073; in 1880, 6134; in 1890, 2667; and in 1900, only 1162. In 1950 the Hawaiian race would be extinct. Such is the influence of civilization on aboriginal races—the

same throughout America and throughout the world. In 1853 the islands were visited by small-pox, and about 6000 died of the epidemic. A new census was taken at the commencement of 1854. The extent of the cultivation of sugar in these islands is shown in the annexed table:

	Acres Cultivated.	
	1852.	1853.
Lihue.....	200	580
Koloa.....	240	650
Honahula, Maui.....	250	300
Makawao, ".....	325	500
Hana.....	45	130
Waimea, Hawaii.....	50	50
Hilo.....	540	540
Total.....	1650	2750

Average yield per acre, 2000 lbs.; average value, five cents per lb.

The *Polynesian* of 29th January, 1853, referring to the year just passed, furnishes the following relating to the commerce of these islands:

"Imports.—There is a large falling off in the value and amount of goods imported for consumption. The value of goods imported, as compared with previous years, is as follows:

1850.	1851.	1852.
\$1,035,058 70.....	\$1,823,821 68.....	\$759,363 54

—giving as an average of imports for three years, \$1,206,249.

"Exports.—The following comparison of some of the staple exports for the islands with those of former years shows at a glance that the exports for 1852 do not equal those of 1850, though a large gain on those of 1851 is apparent.

Staples.	1850.	1851.	1852.
Sugar..... pounds.	750,738	721,030	729,877
Syrup..... gallons.	75,577	60,111	36,375
Molasses.....	53,865	13,631	47,000
Coffee..... pounds.	208,428	37,190	117,210
Salt..... bushels.	7,652	3,769	7,118

"The custom-house receipts in 1850 amounted to \$121,506 73; in 1851, to \$160,602 19; and in 1852, to \$113,091 93; the receipts of the latter year thus showing a decrease of \$47,510 26 as compared with 1851, and of \$7414 80 as compared with 1850. The number of merchant-vessels that visited the islands in 1850 was 469; in 1851, 446; and in 1852, 235. It is impossible," adds the *Polynesian*, "to give the number of 'whalers' that have visited the islands in 1852, but the number is about 300, which is much more than the number in 1851 or 1850. It may be added here, in regard to the number of merchant-vessels in 1850 and 1851, that a large proportion of them were small vessels engaged in the potato trade, while in 1852 the vessels have been generally of a larger class. Another reason for the large number given in 1850 and 1851 was the fact that vessels more generally then touched at several ports, which would increase the number in the custom-house returns, though in fact it should not. The ports being now more generally known, vessels for produce go directly to the port where they can obtain their cargoes." In a commercial point of view, as an entrepôt between the western coast of America and Eastern Asia, these islands are of the greatest importance; and in view of the vast commerce now springing up in the Pacific, and which will eventually revolutionize the trade of the world, it is possible that the United States may see fit to accept the offer to annex them to the national territory. Already the question has been before Congress.—*American Statistical Annual*.

Odessa, a flourishing sea-port of Southern Russia, on the northwest coast of the Black Sea, between the rivers Dniester and Bug, in lat. 46° 28' 54" N., long. 30° 48' 22" E. Population in 1850, 78,000. The foundations of Odessa were laid so lately as 1792, by order of the Empress Catharine, after the peace of Jassy. It was intended to serve as an entrepôt for the commerce of the Russian dominions on the Black Sea and the Sea

of Azof, and has in a great measure answered the expectations of its founders. By an imperial ukase, dated the 7th of February, 1817, it was declared a free port, and the inhabitants exempted from taxation for thirty years; since which period its increase has been extremely rapid. The bay or roadstead of Odessa is extensive, the water deep, and the anchorage good, the bottom being fine sand and gravel; it is, however, exposed to the southeasterly wind, which renders it less safe in winter. The port, which is artificial, being formed by two moles, one of which projects to a considerable distance into the sea, is fitted to contain about 300 ships. It has also the advantage of deep water. There is a convenient lazaretto, on the model of that of Marseilles. The want of fresh water used to be the greatest disadvantage under which the inhabitants labored; but this has been obviated by the construction of a canal, which conveys an abundant supply of water into the town. There are no trees in the vicinity, which has, in consequence, a bleak and arid appearance.

Light-houses.—A light-house has been erected on Cape Fontan, about 6½ nautical miles south of Odessa. The light, which formerly revolved, is now fixed, and is about 203 (Russian) feet above the level of the sea. At the distance of eleven leagues S.E. by E. ½ E. from Odessa, on the north end of the long, narrow, low island of Tendra, a light-house has been erected, of great use to ships approaching Odessa from the south or west. The lantern is elevated 92½ (Russian) feet above the level of the sea. It consists of three reflecting lights, suspended in the form of a triangle, revolving in the space of four minutes, so that each lamp arrives at its maximum of brilliancy after an interval of one minute, twenty seconds. Being also of a red color, this light is readily distinguished from Fontan light, and the other lights in the Black Sea. In foggy weather a bell is kept ringing.—*Coulier sur les Phares*, 2d ed.; NORRIE'S *Sailing Directions for the Mediterranean and Black Seas*, etc. Not being at the mouth of any great river, nor having any considerable manufactures, Odessa is not a port for the exportation of what may be called articles of native growth; but in consequence of her convenient situation, excellent port, and the privileges she enjoys, she is, as already remarked, the emporium where most part of the produce of Southern Russia destined for foreign countries is collected for exportation, and where most part of the foreign articles required for home consumption are primarily imported. The shallowness of the water at Taganrog, and the short period during which the Sea of Azof is navigable, tend to hinder foreign vessels of considerable burden from entering the Strait of Yenikalé, and occasion the shipment of a considerable portion of the produce brought down the Don in lighters to Caffa and Odessa, especially the latter. All the products brought down the Dniester, the Bug, and the Dnieper are exported from Odessa; but owing to the difficult navigation of the first and last mentioned rivers, by far the greater part of the corn brought to Odessa from Podolia, the Ukraine, etc., is conveyed to the town in carts drawn by oxen. The roads traversed by these carts are only practicable at certain seasons of the year; and nothing would contribute so much to increase the commerce of the port, and the prosperity of Southern Russia, as the opening of improved communications with the interior, whether by removing obstructions in the channels of the rivers, constructing canals, or railways, or good common roads. Among the articles of export from Odessa, corn, especially wheat, occupies, as every one knows, the highest rank; but tallow is also an important article; and next to it are linseed, wool, hides, copper, wax, caviar, potash, beef, furs, cordage, sail-cloth, tar, butter, isinglass, etc.

Ports of the Black Sea, the Sea of Azof, and the Crimea.—The importance of the Black Sea as a channel of Russian commerce will be easily understood by cast-

ing an eye over the map of Southern Russia, and tracing the rich and extensive regions which are tributary to its various ports. The Danube and its branches, the Dniester, the Bug, Dnieper, Don, and several lesser rivers, empty their waters into the Black Sea. Odessa is situated on a bay, 30 miles from the mouth of the Dniester, and 60 from that of the River Dnieper. The bay is secure and accessible, and seldom closed by ice. The port is protected by two moles, each extending 315 fathoms, and raised 7½ feet above the surface of the sea; and, thus formed, it will afford ample protection to two hundred large-sized vessels. Akerman is situated near the Black Sea, on the lagoon on the Dnieper. It is the principal outlet of the produce of Galicia, Podolia, and Bessarabia. The lagoon, or liman, on which Akerman is situated, is said to produce annually 7,000,000 poods (252,000,000 pounds) of salt. The port is, however, too shallow for vessels drawing over seven feet of water. Kherson, Nicolaief, and Sevastopol are the remaining principal ports of these seas.

The following table exhibits the tonnage of Odessa in 1852:

Nationality.	Entered.		Cleared.	
	Vessels.	Tonnage.	Vessels.	Tonnage.
England	208	68,601	225	69,175
Austria	198	68,731	206	71,591
Belgium	1	250	2	442
France	42	7,028	42	7,028
Greece	162	43,935	150	40,272
Holland	12	2,658	12	2,640
Ionian Islands ..	14	2,891	13	2,919
Sicily	27	7,024	26	6,696
Sardinia	172	43,623	197	48,792
Sweden, etc.	90	20,412	88	22,605
Tuscany	10	3,557	11	4,200
Turkey	43	8,300	60	11,352
Others	97	20,317	113	30,109
Total in 1852 ..	1076	296,797	1145	317,801
Total in 1851 ..	623	172,179	648	177,138
Increase in 1852	453	124,618	497	140,668

The preceding table exhibits a total of 2221 vessels (entered and cleared), with an aggregate of 614,598 tons, being an increase over 1851 of 950 vessels, with an aggregate of 265,286 tons. If to the figures given in the table is added the coasting trade, viz., 2304 vessels, with an aggregate tonnage of 418,436, the total navigation of the port of Odessa, in 1852, will amount to 4525 vessels, with an aggregate of 1,033,034 tons. An analysis of the table gives to Austria the first rank in the navigation of this port. Total tonnage entered and cleared, 614,598 tons: Austria, 140,322 tons. England holds the second rank, viz., 137,776 tons; then Sardinia, 92,420 tons; Greece, 83,637 tons; Sweden, 43,017 tons. The augmentation in 1852 over 1851 gives Austria 66,878 tons more; England, 61,534 tons more; Sardinia, 38,977 tons more; and Greece, 13,577 tons more. The steam navigation of Odessa is maintained by the two lines of Constantinople and the Danube. The first makes thirty-six voyages (between the two points), and the second eighteen, annually. The Constantinople line conveyed, in 1852, 1214 passengers; that of the Danube, 995; making a total for both lines of 2209 passengers. The first of these transported to Odessa merchandise and specie amounting to 5,411,520 francs, and the other 359,620 francs. There was exported to Constantinople by the first line merchandise valued at 1,669,108 francs; and to the ports of the Danube, by the other, merchandise to the amount of 637,796 francs. Government steamers keep up the communication between the ports of Kherson, Nicolaief, the Crimea, and the Caucasus. In 1852 they made ninety-five voyages from these different points to Odessa, transporting passengers and merchandise.

The different steamers which make Odessa their starting-point made, in 1852, 149 voyages, transporting 20,905 passengers, and merchandise to the amount of 10,705,768 francs, equal to \$2,000,000 nearly.

COMMERCE OF ODESSA.

	1852.	1851.
	France.	France.
Exports.....	103,452,410	53,200,024
Imports.....	86,100,066	29,886,800
Total, France.....	139,642,476	85,086,824

The principal exports were:

Grains, value.....	63,756,826 francs.
Wool, ".....	17,044,716 "
Linseed, ".....	7,969,580 "
Tallow, ".....	1,927,296 "

The principal imports in 1851-'52 were: raw cotton and cotton yarns, olive-oil, dye-stuffs, drugs, metals, wines, and sugar. In 1853 the total value of the foreign trade of Odessa was \$25,953,807, viz.: exports, \$18,583,293; imports, \$7,370,514. Grains constituted the chief export in 1853. Thus, of the \$26,000,000 (in round numbers), grains amounted in value to \$13,000,000; linseed, wool, tallow, and cordage covered \$5,000,000. In 1854 this immense trade must have been completely paralyzed, as an official notification was published at Odessa on 3d March, 1854, prohibiting the exportation of grains of all kinds, from all ports of the Black and Azof Seas, until the 1st of September following. This prohibition, however, is now removed; and official returns, when received, will show how far the blockade of the Russian ports by the allied powers affected the trade of the Black Sea. By declaration published at St. Petersburg 7th [19th] April, 1856, all the mercantile harbors of Russia are open to the merchant vessels of neutral countries.

The total value of the trade of the ports of the Sea of Azof (Taganrog, Kertch, Rostoff, Mariopol, and Berdiansk), was, in 1851: imports, 6,902,000 francs; exports, 27,182,000 francs.

The imports were chiefly from Turkey, the Two Sicilies, Ionian Islands, France, and Greece. The exports were destined to Turkey, England, Sardinia, Tuscany, Ionian Islands, and France. The total value of the trade at the commercial ports of the Crimea (Eupatoria, Balaklava, Theodosia, and Kertch), in 1852, was: imports (including specie), 1,092,500 francs; exports, 654,500 francs. Total, 1,747,000 francs.

Compared with 1851, the imports increased 12 per cent., and exports decreased nearly 60 per cent. Imports consisted of cottons, raw cotton, coals, oil, and fruits; exports, of wool, raw hides, butter, caviar, and grains.—*United States Commercial Relations.*

The United States Consul, under date of July 1, 1854, communicates the following information: There exists a treaty of commerce between the United States and the Imperial Russian government, which was concluded at St. Petersburg on the 6th [18th] December, in the year 1832, and was ratified at Washington on the 11th May, 1833, to which the Russian government abides with strictness. The city and port of Odessa was declared as *porto-franco* by a decree of the imperial government in the year 1823, which was put into execution only on the 15th August, in the year 1824, by which the importation of all kinds of merchandise was allowed, on paying only one-fifth of the entire duty paid in other ports of this empire; and this one-fifth duty was employed to defray the annual expenditure for the benefit of this city, such as pavements, footpaths, repairing streets, lights, government buildings, and for the expenses of all the local administrations. The importation of all kinds of merchandise is allowed, even those articles which are prohibited at all other ports of the empire, but they are not allowed to be transported into the interior from hence, as tea, refined sugars, strong spirits, cloths—black and green—printed cottons, silks, and wools. These articles are to be consumed at Odessa. The term of these privileges for Odessa expired in the year 1849, but his majesty the emperor, wishing to favor this city, granted a prolongation of the same privileges for a period of five years, which ends on the 14th August, 1854. During this last period the duty was augmented; instead of

one-fifth, it is now two-fifths of the entire duty on the import of any kind of merchandise, with the exception of tobacco, rum, and other strong spirits, on which the entire duty is paid, as at all other ports of Russia. Refined sugars, tea, and wines, have to pay three-fifths of the entire duty, one-fifth of which is destined for expenses of this city, and the remainder in favor of government. There does not exist at this port any privilege granted to any nation, in any way, which is denied to citizens of the United States. The only restriction existing at Odessa is on ships under French and Neapolitan colors, they not being allowed to import any merchandise from foreign countries to Russia, unless paying 50 per cent. more on the import duty, in comparison to Americans, or ships of other nations. This difference on French and Neapolitan vessels exists by the commercial treaties between the respective powers, by which it is also prohibited for Russian vessels to import to France or to Naples merchandise from foreign ports not Russian produce, as the cargo must be, and from a Russian port. There are no differences in the charges, or any other dues, on ships of the United States and Russian vessels. A Russian vessel of 150 lasts (equal to 300 tons) pays the same charges as an American of the same size. The following affords a comparative statement:

Lasts, 150, at 17-100 per last.....	S. R. 25 50 = \$19 18
Light dues.....	7 15 = 5 38
Quarantine dues, custom-house charges and fees.....	20 00 = 15 04

The tonnage and light dues are a fixed charge, and established by law; the quarantine and custom-house dues are not so. The amount of the latter charges is generally paid partly for stamp paper, fees, and other trifles, which reaches the sum above stated, and which every one pays without opposition, as it is the custom and has been for many years past, and by which means business is greatly facilitated. It is prohibited by law to reship merchandise from one ship to another, even if the merchandise reshipped be destined for another Russian port, and no matter under what colors it is brought to this port. The merchandise, before reshipment, must first be landed and visited by the custom-house authorities, and the whole amount of duty paid, before permission can be obtained for such merchandise to be shipped and transported to another Russian port. But if such merchandise be destined for a foreign port, it has to be landed, and after being visited by the custom-house officers, a certificate to that effect is given to the shippers of the cargo, allowing the re-shipment and exportation to a foreign port. All foreign, as well as American vessels are allowed to share in the coasting trade from one Russian port to another in the Black Sea or the Sea of Azof. The current coin, weights, measures, etc., are the same at Odessa as at St. Petersburg. The value of a silver ruble is 75-²⁸/₁₀₀ cents of an American dollar; one pood weight is 36 English pounds; one arshine measures 28 English inches; one chetwert of wheat is 5½ English bushels.

The only cargo exported from hence for America since the 1st of July, 1853, consisted of common washed wool, 505 bales, weighing 5972 poods, 23 pounds; and linseed, 1200 chetwerts—the whole shipped on board of an American bark of 380 tons, bound for New York, and cleared from hence on the 10th November, 1853. The duty on the cargo amounted to 342-80 silver rubles, or \$257 80, being on the linseed alone, as there is no duty on the exportation of wools. No insurances have ever taken place here for the United States, but the general custom is to insure in England for America. The custom in purchasing any kind of merchandise for exportation at this place is to pay ready cash, and without any discount whatever; but in the sale of colonial and other goods imported from abroad sometimes a credit of six or eight months is granted to the buyers. There is no established rate of exchange here for the United States, but the value of the dollar is

nominal at $1\frac{1}{2}$ silver ruble. The amount of duty paid here on merchandise exported for America during the last period amounts to \$257; but no import duty was paid here, as no merchandise arrived from America. There is no duty levied in Russia by government on produce exported in its new state, or partly manufactured, or entirely so; the only existing duty is on raw sugars, on which the refiners of Russia pay an excise to government of $\frac{60}{100}$ silver rubles per pood on the refined sugars, or $45\frac{1}{100}$ cents in American currency. Laborers are generally paid here by the day, and, the rate not being fixed, fluctuates according to the wants of such men—rising from $\frac{30}{100}$ to one silver ruble per day, or from $22\frac{1}{2}$ to 75 cents per day, American currency.

A tribunal of commerce was established at Odessa in 1824, whose jurisdiction extends over all disputes connected with trade. There is no appeal from its decisions except to the Senate. There are twelve sworn brokers, approved and licensed by the Tribunal of Commerce, who have deputies appointed by themselves. They register all transactions, and receive $\frac{1}{2}$ per cent. from each party as commission. There is a discount or loan bank, established in 1828, and marine and fire insurance societies. Most articles of provision are cheap; and fish, which costs next to nothing, is excellent. Fuel, however, is scarce and dear. Within the last thirty years, the Merino breed of sheep has been extensively introduced into the governments of Taurida, Cherson, and Ekaterinoslov; so that there has been not only a great increase in the quantity, but also a very decided improvement in the quality, of the wool exported. *Corn Trade.*—The principal trade of Odessa is with Constantinople, Smyrna, and other towns in the Levant, Naples, Leghorn, Genoa, Marseilles, etc. "It is generally stated," says Mr. Jacob (*Memoir on the Trade of the Black Sea*, in the *Appendix* to the octavo edition of *Tracts on the Corn Trade*), "that the supply of Constantinople requires annually 100,000 quarters of Black Sea wheat. The Greek Islands scarcely, on the average of years, produce sufficient wheat for their own consumption, and in some years require a large supply, which is furnished partly from the neighboring continent, and partly from the Black Sea. The Asiatic coasts of the Turkish Empire, especially in Anatolia, are nearly in the same predicament. At times the market of Smyrna is very favorable for the sale of the corn of Southern Russia. The islands of Malta and Gozo produce only about half as much corn as the 120,000 inhabitants require. Sicily, though it has greatly declined from its ancient productiveness, has still a quantity of grain to spare for the less fruitful parts of Italy in most years, and its wheat enters into competition with that of the Black Sea, in the ports of Naples, Genoa, and Leghorn. There are few years in which Tuscany grows a sufficiency of wheat; and its chief port, Leghorn, being one of those in which ships can unload their cargoes of corn, without being detained to perform quarantine, has been at all times a place of deposit for the wheat of the Black Sea. A market at some price may always be found there, as the capitalists are disposed to purchase, relying on the uncertain productiveness of some adjacent country, in which they may realize a profit at no great distance. Genoa, like Leghorn, is a port where wheat can be unloaded within the bounds of the lazaretto. The country around it yields but little wheat; and at some periods it enjoys a trade in that article even as far as Sunderland. This internal demand, and the chance of advantageous re-exportation, induces much trade in corn. There is said to be seldom less than 100,000 quarters in store at the two ports of Genoa and Leghorn, and at some periods a far greater quantity. Nice, though not having the same advantageous quarantine regulations, and, consequently, not being a *dépôt* for corn beyond its own demand, from the sterile soil that surrounds it, requires every year a large importation

of wheat. That of Sicily and Odessa creates a competition in its port, and the government draws a revenue by imposing a heavy duty on both. Though the corn laws of France have kept the ports closed against the introduction of foreign corn for domestic use, yet it is allowed to be bonded for re-exportation. From the frequent local and partial scarcities which occur on the eastern coast of Spain, at which periods wheat is allowed to be lawfully imported, and, it is said, from the facility of its introduction by contraband when not legally allowed, Marseilles has been a great *dépôt* for the wheat of the Black Sea. From thence, as also from Gibraltar, where there is generally some in store, it can easily be transported to Spain, to Sardinia, to Corsica, to Tunis, to Tripoli, or wherever scarcity has created a beneficial market. The coasts of Barbary, though often having a surplus of wheat, much of which occasionally assists to feed Portugal, in some seasons have been affected with most deficient harvests. This was recently the case in a remarkable degree. Tripoli and Tunis experienced, in the year 1820, a harvest most miserably short, and were supplied from other countries." The warehouse rent of corn at Odessa is from eight to ten copecks per chetwert per month. M. De Hagemeister supposes that Turkey and the different ports of the Mediterranean require, at an average, an annual supply of 1,400,000 chetwerts, or about 1,050,000 quarters, of which 1,000,000 chetwerts, or 750,000 quarters, are furnished by Southern Russia, and principally shipped from Odessa. Wallachia and Moldavia are both very fertile in corn; and were tranquillity and good order introduced into them, and the free navigation of the Danube secured, Galacz and Brailoff would be two of the principal European grain-shipping ports.—See the excellent Report of HAGEMEISTER on the Trade of the Black Sea, p. 96–114, Engl. Trans. Exclusive of corn, the other articles mentioned as being exported from Odessa find their way to the different markets in the Mediterranean. Those shipped for Turkey are iron, tallow, sail-cloth, cordage, anchors for ships of war, butter, etc. The exports to Italy and other European countries are similar. The importation of all foreign articles into the Russian dominions on the Black Sea and the Sea of Azof is confined to Odessa, Theodosia or Kaffa, and Taganrog. The import trade is, however, of inferior importance when compared with the export trade. The principal articles are sugar and coffee, dye-woods, vine and brandy, cotton stuffs and yarn, woolen and silk manufactures, spices, cutlery; oranges, lemons, figs, and other fruit; lemon-juice, oil, tin and tin plates, dried fruits, paper, silk, specie, etc.

Odessa, in addition to its great and rapidly increasing trade with Constantinople and the countries on the Mediterranean, had, before the war of 1854–1855, a considerable trade with Redout-kalé at the mouth of the Phasis, and with Trebizond and several ports on the south coast of the Black Sea. Georgian and Armenian merchants are already considerable purchasers at the Leipsic and other German fairs, and civilization is beginning to strike its roots throughout all the extensive countries between the Black Sea and the Caspian. It is probable that at no very remote period the Phasis will be frequented by British ships; and that merchants, without any enchantress to aid them, and depending only on the superior cheapness and excellence of their goods, will be hospitably received in the ancient Colchis, and bear away a richer prize than fell to the lot of Jason and his compeers.—See RUSSIA.

Offing, or Offin, in Nautical language, that part of the sea, a good distance from shore, where there is deep water and no need of a pilot to conduct the ship. Thus if a ship from shore be seen sailing out to seaward, they say, "She stands for the offing;" and if a ship, having the shore near her, have another a good way without or beyond her, toward the sea, they say, "That ship is in the offing."

Ohio, one of the United States, lies between lat. 38° 30' and 42° N., and between long. 80° 35' and 84° 47' W. It is 210 miles long from north to south, and 200 miles broad. Area, 39,964 square miles. The population in 1790 was 8000; in 1800, 45,365; in 1810, 230,760; in 1820, 581,434; in 1830, 937,637; in 1840, 1,519,467; and in 1850, 1,980,408. The land in the interior of the State and bordering on Lake Erie is generally level, and in some places marshy. From one quarter to one third of the State, comprehending the eastern and southeastern parts, bordering on the Ohio River, is generally hilly and broken, but in no part mountainous. On the margin of the Ohio River and several of its tributaries are alluvial lands of great fertility. The valleys of the Scioto and the Great and Little Miami are the most extensive sections of level, rich, and fertile lands in the State. At the head of the Muskingum River are prairies of considerable extent, some of which are wet, though generally dry and fertile. The height of land which divides the waters which fall into the Ohio from those which fall into Lake Erie is the most marshy of any in the State, while the land on the margin of the rivers is generally dry. Wheat may be regarded as the staple production of the State, though Indian corn and other grains are largely cultivated. It is rich in mineral wealth, iron, coal, limestone, marble, and superior building stone, grind-stones, etc. There are many valuable salt springs. There were in this State in 1850, 9,851,493 acres of land improved, and 8,146,000 of unimproved land in farms; cash value of farms, \$358,758,603; and the value of implements and machinery, \$12,750,585. *Live Stock*—horses, 463,397; asses and mules, 3423; milch cows, 544,499; working oxen, 65,381; other cattle, 749,067; sheep, 3,942,929; swine, 1,964,770. Value of live stock, \$44,121,741.

Agricultural Products, etc.—Wheat, 14,487,351 bushels; rye, 425,918; Indian corn, 59,078,695; oats, 13,472,742; barley, 354,358; buckwheat, 688,060; peas and beans, 60,168; potatoes, 5,057,769; sweet potatoes, 187,991. Value of products of the orchard, \$695,921; of the market-gardens, \$214,004. Pounds of butter made, 34,449,379; of cheese, 20,819,542; maple sugar, 4,588,209; molasses, 197,308 gallons; beeswax and honey, 804,275 pounds; wool produced, 10,196,371; flax, 446,932; silk cocoons, 1552; hops, 63,731; tobacco, 10,454,449; hay, tons of, 1,433,142; hemp, 150; clover-seeds, 103,197 bushels; other grass seeds, 37,310; flax-seed, 188,880; and were made, 48,207 gallons of wine. Value of home-made manufactures, \$1,712,196; of slaughtered animals, \$7,439,243.

Rivers, etc.—The Ohio River, which gives name to the State, washes its entire southern border. This river is 1004 miles long from Pittsburg to its mouth, by its various windings, though it is only 614 in a direct line.—See OHIO RIVER. The Muskingum, the largest river which flows entirely in this State, is formed by the junction of the Tuscarawas and Walhonding rivers, and enters the Ohio at Marietta. It is navigable for boats 100 miles. The Scioto, the second river in magnitude, flowing entirely within the State, is about 200 miles long, and enters the Ohio at Portsmouth. Its largest branch is the Whetstone, or Olentangy, which joins it immediately above Columbus. It is navigable for boats 180 miles. The Great Miami, a rapid river in the western part of the State, is 100 miles long, and enters the Ohio in the southwest corner of the State. The Little Miami has a course of seventy miles, and enters the Ohio seven miles above Cincinnati. The Maumee, 100 miles long, rises in Indiana, runs through the northwest part of the State, and enters Lake Erie at Maumee Bay. It is navigable for steamboats to Perrysburg, eighteen miles from the lake, and above the rapids is boatable for a considerable distance. The Sandusky rises in the northern part of the State, and, after a course of about eighty miles, enters Sandusky Bay, and thence into Lake Erie.

The Cuyahoga rises in the north part of the State, and after a curved course of sixty miles, enters Lake Erie at Cleveland. It has a number of falls, which furnish valuable mill seats. Besides these there are Huron, Vermilion, Black, Grand, and Ashtabula rivers, which enter Lake Erie.

The principal places are Cincinnati, the metropolis; Columbus, the Capital; Cleveland, Sandusky, Dayton, Springfield, Zanesville, Marietta, and Portsmouth. There were in February, 1854, sixty-eight banks, with a paid capital of \$8,718,366; in January, 1856, forty-six railroads, of which 2725 miles of track were finished and in operation, and 1578 in course of construction. Tonnage of the State in 1853, 25,632 tons.

Manufactures, etc.—There were in the State in 1850 eight cotton factories, with a capital invested of \$297,000, employing 132 males and 269 females, producing 280,000 yards of sheetings, etc., and 443,000 pounds of yarn, valued at \$394,700; 130 woolen factories, with a capital of \$870,220, employing 903 males and 298 females, manufacturing 1,374,087 yards of cloth, and 65,000 pounds of yarn, valued at \$1,111,027; thirty-five establishments making pig-iron, with a capital of \$1,503,000, employing 2415 persons, producing 52,658 tons of pig-iron, etc., and the entire value of products, \$1,255,850; 183 establishments, with a capital of \$2,063,650, employing 2758 persons, and making 37,399 tons of iron castings, etc., valued at \$3,069,350; eleven establishments, with a capital of \$620,800, employing 708 persons, manufacturing 14,416 tons of wrought iron, valued at \$1,076,192; 1082 flouring and grist-mills; 1730 saw-mills; 243 printing-offices, 302 newspapers, twenty-eight daily, six tri-weekly, four semi-weekly, 222 weekly, seven semi-monthly, twenty monthly, and one yearly publication. Capital invested in manufactures, \$28,612,136; value of manufactured articles, \$61,915,036.—See PORK for further information.

Educational Establishments, etc.—The University of Ohio at Athens, the Miami University at Oxford, Franklin College at New Athens, the Western Reserve College at Hudson, Kenyon College at Gambier, Granville College at Granville, Marietta College at Marietta, Oberlin College at Oberlin, St. Xavier at Cincinnati, Ohio Wesleyan University at Delaware, Wittenberg College at Springfield, Willoughby University at Willoughby, Lane Theological Seminary at Cincinnati. There are also theological departments at Kenyon, Western Reserve at Hudson, Granville at Granville, Oberlin at Oberlin, Wittenberg at Springfield, and a seminary of the Associate Reformed Church at Oxford, Western Reserve Medical College at Cleveland, Medical College of Ohio at Cincinnati, Medical College (Homeopathic) at Cleveland, Starling Medical College at Columbus, and Cincinnati Law College at Cincinnati. The whole having, in 1850, 3621 students. There were also 206 academies, 5052 pupils; 11,661 schools, 484,153 scholars; 352 libraries—aggregate number of volumes, 186,826. School fund, \$304,474.

The first permanent settlement in Ohio was made in 1788 at Marietta. In 1802 Ohio was admitted into the Union.

The progress of banking in the State of Ohio is shown in the following summary:

Year.	Number of Banks.	Capital.
1805	1	\$200,000
1811	4	895,000
1815	12	1,484,000
1816	21	2,061,000
1820	20	1,797,000
1835	24	5,819,000
1838	33	9,247,000
1840	37	10,507,000
1845	8	2,171,000
1850	56	7,129,000
1856	60	6,995,900
1857	54	5,398,000

The free-banking law of Ohio was adopted in the year 1851, and forms at present a part of the banking system in operation.

FOREIGN COMMERCE OF THE STATE OF OHIO (SHOWING ALSO THE DISTRICT TONNAGE IN 1831, 1831, 1841, AND 1851) FROM OCTOBER 1, 1820, TO JULY 1, 1856.

Cincinnati, the metropolis of Ohio, capital of Hamilton county, and one of the leading commercial places west of the Alleghany Mountains. It is situated on the right bank of the Ohio River, 455 miles below Pittsburgh, 1548 miles above New Orleans, and 502 miles from Washington. It is the largest city of the Mississippi Valley, north of New Orleans, and the fifth in population in the United States. Population in 1800, 750; in 1810, 2540; in 1830, 24,831; in 1840, 46,338; in 1845, 65,000; in 1850, 115,438; in 1853, 160,141. The Ohio River at Cincinnati is 1800 feet, or about one-third of a mile wide, and its mean annual range from low to high water is about fifty feet; the extreme range may be about ten feet more. Depressions are gener-

ally in August, September, and October, and the greatest rise in December, March, May, and June. The upward navigation is in winter very rarely suspended by floating ice, and in some winters not at all. Its current at its mean height is about three miles an hour; when higher, or rising, it is more; and when very low, it does not exceed two miles. Cleveland, Toledo, and Sandusky, on Lake Erie, export largely in grain, lumber, and manufactured goods.—See *North American Review*, lxiii. 320 (HILDRETH), xxii. 459 (SPARKS), xlvii. 1 (J. H. PERKINS), xlix. 69; *American Journal of Science*, xlv. 12; *DE BOW'S Review*, iii. 129; *Bankers' Magazine*, 1856; *HUNT'S Merchants' Magazine*, xxi. 389.

Ohio, a large river of the United States, formed by the confluence of the Alleghany from the north and the Monongahela from the south at Pittsburg, in the western part of Pennsylvania, lat. 40° 32' N. and long. 80° 2' W., at the height of 1138 feet above tide-water in the Atlantic. It proceeds in a direction west-south-west, dividing the states of Virginia and Kentucky on the south from Ohio, Indiana, and Illinois on the north, and enters the Mississippi in lat. 37° N. and long. 88° 58' W. Its length from Pittsburg to its mouth, by the course of the river, is 948 miles; but the distance in a direct course is only 614 miles. It has a descent, in its whole course, of 395 feet, making an average descent of not quite five inches in a mile. The width of the Ohio varies from 400 to 1400 yards; its average width is 534 yards, opposite to Cincinnati, which is about equidistant from Pittsburg to its confluence with the Mississippi, where it is about 900 yards wide. The great valley drained by this river contains over 218,000 square miles, and a population of over 5,000,000, which is rapidly increasing. There are no considerable falls in this river excepting at Louisville, Kentucky, where it descends 22½ feet in two miles. These falls have been obviated by a canal around them, which admits of the passage of the largest steamboats; but boats ascend and descend these rapids, when the water is high. The current of the Ohio, when low, does not exceed two miles an hour; when at a mean height, three miles; and when higher and rising, four or five miles. The highest water occurs in December, March, May, and June; and the lowest in August, September, and October. The average difference between high and low water is 40 feet; its extreme range on record, 64 feet (at Cincinnati). During eight or ten weeks in the winter, the navigation is obstructed by floating ice. Of the two confluent rivers which form the Ohio, the Alleghany is the most important, being navigable for boats 260 miles to Olean, New York, and will hereafter, by means of the Genesee Valley Canal, terminating at this place, and extending to the Erie Canal, form an important communication between the city of New York and the West. The principal tributaries of the Ohio on the north are the Beaver, Muskingum, Scioto, the two Miamis, Whitewater, and Wabash; those on the south are the Kanawha, Sandy, Licking, Kentucky, Green, Cumberland, and Tennessee. Some of these are navigable at high water to a great extent by boats and steamboats. The Tennessee is navigable by boats for 1000 miles; the Cumberland is navigable for steamboats to Nashville, and for keel-boats 300 miles further; the Wabash is navigable for 200 miles; Green River, 200 miles; Kentucky, 150; Great Kanawha, 64 miles, to the salt works. The Ohio, with its tributaries, has 5000 miles of navigable waters.

The whole fall of the Ohio from Pittsburg to Cairo is estimated at 425 feet, and the distance is 977 miles. The average fall per mile is therefore less than five inches. The fall of the River Thames is greater than this, being an average of nearly seven inches per mile for one hundred and eighty miles. Indeed few rivers of equal length and volume of water have so few falls or rapids impeding navigation as the Ohio.

Its fall, however, is not distributed equally over its whole course, as the following table will show:

	Distance.	Fall.	Averages.
	Miles.	Feet.	Inches.
From Pittsburg to Wheeling..	88	79	10.77
From Wheeling to Cincinnati.	374	188	6
From Cincinnati to Louisville.	166	55	4.2
From Louisville to Falls.....	3	27	100
From Falls to Evansville	169	33	2.85
From Evansville to Cairo.....	187	45	2.9

From this table it will be seen that were it necessary to "canalize" the whole river, from its mouth to Pittsburg, it would be the most magnificent channel of trade on the face of the globe. No canal was ever constructed, and probably none could be constructed, of equal length, with comparatively as little lockage as this.

The Erie Canal has about five times the lockage in proportion to its length; and the Pennsylvania Canal, from Pittsburg to Johnstown, has more than ten times as much. But it should be remembered that it will be unnecessary, for the purpose of making this great improvement, to overcome all this fall of 425 feet by means of locks and dams. A large part of this whole descent is due to the gentle flow of the river, through the long pools which make up the most of its distance, and which, in their natural condition, afford a sufficient depth of water at all seasons of the year for the purposes of navigation. What proportion of this whole fall of 425 feet is thus due to these pools, which need no improvement, we are unable to determine; but it must be a very considerable proportion of it, and would leave a comparatively small aggregate to be overcome by locks and dams or wing dams. It would be unnecessary to construct these dams so high as to flow back the water from one to the other, but only to rise from one of these pools to another, or perhaps, in some cases, to unite one or more of them in one. To reduce the whole river to a series of long levels, as in the construction of canals, would not be required, and indeed would be liable to grave objections on the score of health. A depth of about five feet at the lowest stage of water would be all that would be necessary to render the Ohio the most important channel of commerce in the world. This depth could be had without affecting unfavorably the healthfulness of the river, and would be enough for the first class of steamers which now ply on the river.

The volume of water in this stream, in an improved condition, would be ample, for ten or eleven months in the year, to meet the wants of a commerce large enough to tax to the utmost the capacity of ten canals equal to the Erie when enlarged; and so favorable is the climate, that the obstructions from ice would be of very short duration, if, indeed, such impediments would ever occur. It is well known that the Monongahela suffers less inconvenience from ice, in its present condition, than it did before it was improved by locks and dams, and no good reason can be given why the same results would not follow the improved navigation of the Ohio. That the growing demands of trade in the Great West will imperatively require this great work to be speedily accomplished, no man who has at all considered this subject can for one moment doubt. Saying nothing of the great staples of agriculture, which already seek our Eastern cities through the valley of the Ohio, and which will continue to increase in a ratio that will almost defy computation, there are immense resources of undeveloped mineral wealth, whose tonnage will soon exceed that of all the traffic now done upon the river, and upon all the railroads running nearly parallel with it through the Western States. The vast treasures of coal, iron, and salt, are there in store for the scores of millions which will soon inhabit the rich valley of the Ohio. But admitting that the river, when improved by locks and dams, would impose a heavy expense for lockage, still the actual expense of navigation would be far less than is now imposed upon it, in consequence of the ruinous delays and disruptions of business, arising from the sudden rise and fall of the river. Though subjected to tolls at the locks, the certainty and regularity with which steamers could make their trips would more than compensate this expense. The whole system of passage and freight would be systematized, and in the aggregate rendered far less expensive and hazardous. Indeed, in whatever light this grand scheme may be viewed, it is matter of surprise that public attention has not been fully directed to it before, and that statesmen should not long ago have urged its paramount importance upon the attention of Congress.—See article MISSISSIPPI RIVER.

Oil (Fr. *Huile*; Germ. *Oel*; It. *Olîe*; Lat. *Oleum*; Russ. *Maslo*; Sp. *Acêite*). The term *oil* is applied to

designate a number of unctuous liquors, which, when dropped upon paper, sink into it, and make it seem semi-transparent, or give it what is called a greasy stain. These bodies are very numerous, and have been in common use from time immemorial. Chemists have divided them into two classes; namely, *volatile* and *fixed* oils. Oil was used for burning in lamps as early as the epoch of Abraham, about 1921 B.C. It was the staple commodity of Attica, and a jar full was the prize at the Panathenean games. It was the custom of the Jews to anoint with oil persons appointed to high offices, as the priests and kings, *Psalm cxxxiii. 2; 1 Sam. x. 1, xvi. 13*. The anointing with this liquid seems also to have been reckoned a necessary ingredient in a festival dress, *Ruth, iii. 3*. The fact that oil, if passed through red-hot iron pipes, will be resolved into a combustible gas, was long known to chemists; and after the process of lighting by coal-gas was made apparent, Messrs. Taylor and Martineau contrived apparatus for producing oil-gas on a large scale.—HAYDN.

We borrow from Dr. Thomas Thomson the following statement with respect to these bodies:

I. **VOLATILE OILS**, called also *essential oils*, are distinguished by the following properties: 1. Liquid, often almost as liquid as water, sometimes viscid; 2. Very combustible; 3. An acrid taste and a strong fragrant odor; 4. Volatilized at a temperature not higher than 212°; 5. Soluble in alcohol, and imperfectly in water; 6. Evaporate without leaving any stain on paper. By this last test it is easy to discover whether they have been adulterated with any of the fixed oils. Let a drop of the volatile oil fall upon a sheet of writing-paper, and then apply a gentle heat to it; if it evaporates without leaving any stain upon the paper, the oil is pure; but if it leaves a stain upon the paper, it has been contaminated with some fixed oil or other. Volatile oils are almost all obtained from vegetables, and they exist in every part of plants—the root, the bark, the wood, the leaves, the flower, and even the fruit, though they are never found in the substance of the cotyledons; whereas the fixed oils, on the contrary, are almost always contained in these bodies. When the volatile oils are contained in great abundance in plants, they are sometimes obtained by simple expression. This is the case with oil of oranges, of lemons and bergamot; but in general they can only be obtained by distillation. The part of the plant containing the oil is put into a still with a quantity of water, which is distilled off by the application of a moderate heat. The oil comes over along with the water, and swims upon its surface in the receiver. By this process are obtained the oils of peppermint, thyme, lavender, and a great many others, which are prepared and employed by the perfumer. Others are procured by the distillation of resinous bodies. This is the case in particular with oil of turpentine, which is obtained by distilling a kind of resinous juice, called turpentine, that exudes from the juniper. Volatile oils are exceedingly numerous. They have been long known; but as their use in chemistry is but limited, they have not hitherto been subjected to an accurate chemical investigation. They differ greatly in their properties from each other, but it is impossible at present to give a detailed account of each.

1. The greater number of volatile oils are *liquid*; many, indeed, are as limpid as water, and have none of that appearance which we usually consider oily. This is the case with the following; namely, oil of turpentine, oranges, lemons, bergamot, roses. Others have the oily viscosity. It varies in them in all degrees. This is the case with the oils of mace, cardamom, saffron, cloves, cinnamon. Others have the property of becoming solid. This is the case with the oils of parsley, fennel, anise seed, balm. Others crystallize by slow evaporation. This is the case with oil of thyme, peppermint, marjoram. The oil of nutmegs has usually the consistence of butter. This is the case also with the oils of hops and of pepper. 2. The color

of the volatile oils is as various as their other properties. A great number are limpid and colorless; as oil of turpentine, lavender, rosemary, savine, anise seed: some are yellow; as spike, bergamot; some are brown; as thyme, savory, wormwood: others blue; as camomile, motherwort: others green; as milfoil, pepper, hops, parsley, wormwood, cajuput, juniper, sage, valerian: others, though at first colorless, become yellow or brown by age; as cloves, cinnamon, saffron. 3. The odors are so various as to defy all description. It is sufficient to say, that all the fragrance of the vegetable kingdom resides in volatile oils. Their taste is acrid, hot, and exceedingly unpleasant. 4. Their specific gravity varies very considerably, not only in different oils, but even in the same oil in different circumstances. When the volatile oils are heated in the open air, they evaporate readily, and without alteration diffuse their peculiar odors all around; but there is a considerable difference between the different oils in this respect. When distilled in close vessels, they do not so readily assume the form of vapor. Hence they lose their odor, become darker in color, and are partly decomposed. Oils do not seem very susceptible of assuming the gaseous form, unless some other substance, as water, be present.

II. **FIXED OILS** are distinguished by the following characters: 1. Liquid, or easily become so when exposed to a gentle heat; 2. An unctuous feel; 3. Very combustible; 4. A mild taste; 5. Boiling point not under 600°; 6. Insoluble in water, and nearly so in alcohol; 7. Leave a greasy stain upon paper.

These oils, which are called fat or expressed oils, are numerous, and are obtained partly from animals and partly from vegetables, by simple expression. As instances, may be mentioned whale oil or train oil, obtained from the blubber of the whale and from cod: olive oil, obtained from the fruit of the olive; linseed oil and almond oil, obtained from linseed and almond kernels. Fixed oils may also be extracted from poppy seeds, hemp seeds, beech mast, and many other vegetable substances.

All these oils differ from each other in several particulars, but have also many particulars in common.

1. Fixed oil is usually a liquid with a certain degree of viscosity, adhering to the sides of the glass vessels in which it is contained, and forming streaks. It is never perfectly transparent; has always a certain degree of color, most usually yellowish or greenish; its taste is sweet, or nearly insipid. When fresh it has little or no smell.

There exist also in the vegetable kingdom a considerable number of bodies which, at the ordinary temperature of the atmosphere, are solid, and have hitherto been considered as fixed oils. Palm oil may be mentioned as an example. The various substances used in India and Africa as substitutes for butter, and as unguents, may likewise be mentioned.

2. All the fixed oils hitherto examined are lighter than water, but they differ greatly from one another in specific gravity. The same difference is observable in different samples of the same oil. Fixed oil, when in the state of vapor, takes fire on the approach of an ignited body, and burns with a yellowish white flame. It is upon this principle that candles and lamps burn. The tallow or oil is first converted into a state of vapor in the wick; it then takes fire, and supplies a sufficient quantity of heat to convert more oil into vapor; and this process goes on while any oil remains. The wick is necessary to present a sufficiently small quantity of oil at once for the heat to act upon. If the heat were great enough to keep the whole oil at a temperature of 600°, no wick would be necessary, as is obvious from oil catching fire spontaneously when it has been raised to that temperature. When oil is used in this manner, either in the open air or in contact with oxygen gas, the only new products obtained are *water* and *carbonic acid*. The drying oils are used as the vehicle of paints and varnishes. Linseed, nut, poppy, and

hemp-seed oils belong to this class. These oils in their natural state possess the property of drying oils, but imperfectly. To prepare them for the use of the painter and varnish maker, they are boiled for some time in an iron pot, and sometimes burned till they become viscid. When they burn for some time, their unctuous quality is much more completely destroyed than by any method that has been practiced. Hence it is followed frequently in preparing the drying oils for varnishes, and always for printers' ink, which requires to be as free as possible from all unctuousity. Nut oil has been found preferable to all other oils for printers' ink; though the dark color which it acquires during boiling renders it not so proper for red ink as for black. Linseed oil is considered as next after nut oil in this respect. Other oils can not be employed, because they can not be sufficiently freed from their unctuousity. Ink made with them would be apt to come off and smear the paper while in the hands of the bookbinder, or even to spread beyond the mark of the types and stain the paper yellow.

The kind of oil used for burning in lamps varies, in different parts of the world, with the sources of supply. Whale oil is used in Great Britain, but seal oil, fish oil, and oils obtained from seeds by pressure are also

largely consumed. In Paris the oils of rape-seed and of poppy-seed are used; and in the south of France, and in Italy, an inferior kind of olive oil, and also the oil of the earth-nut, are employed. In the latter country a lamp oil is expressed from grape-stones. In Piedmont walnut oil is common; oil of sesamum-seed is burned on the eastern and southern coasts of the Mediterranean; while in tropical countries cocoa-nut oil, which is solid in the climate of Great Britain, is generally used. In China, the *Camellia oleifera* is cultivated for the sake of the oil obtained from its seeds; also a shrub, *Croton sebiferum*, the fruit of which yields a useful oil. In consequence of the deficient supply of tallow during the late war with Russia, inquiries have been set on foot in various parts of the world as to the seeds and other vegetable products from which oil may be obtained, and the result of these inquiries has already shown that many oil-yielding substances, not before known in commerce, exist. The export of oils from the East Indies, especially *gingelly*, has greatly increased. Pistachio-nut oil is becoming common, as is also ground-nut oil from Africa. All these oils are used for burning in lamps.

The following is a list of the plants which yield the ordinary unctuous oils of commerce:

No.	Plants.	Oils.	Specific Gravity

41.	<i>Pinus abies</i> D.		

Candia.—A fair crop or yield of olive oil is estimated at two million gallons, and two and a half millions an abundant crop. Although immense numbers of olive-trees were cut down during the "Greek war" and the civil commotion in 1840, the population is still insufficient to attend to them, and the only culture they receive is slightly plowing the ground on which they stand. The fruit is allowed to drop from the tree, when it is collected by women and children, who receive for their trouble one-third the quantity they collect; if the crop is abundant, generally one quarter is lost for want of hands to collect it. In the district of Opokero the fruit is beaten from the trees, evidently to its injury, for it is smaller in that section than in any other part of the island. The fruit is collected in heaps and taken to a wooden mill of very primitive and rough construction, operated by four men. The oil from the first pressure belongs to the owner of the

olives, out of which the government receives one-tenth; the mass is again pressed, and one-third quantity, in comparison with the first pressure, is obtained, although of an inferior quality; this is divided into tenths, one of which belongs to the government, two divided among the workmen, and the remainder belongs to the owner of the mill.

An instance of the demand for oil is manifest in the palm-oil trade with the west coast of Africa. A few years ago—probably less than fifteen—palm oil, in the west of Africa, was worth a dollar a gallon, and a late account from that region says not one thousand gallons left the country in a year. Now the traffic in that article with Great Britain alone amounts to 700,000 gallons a year, at an average of thirty-three cents a gallon; and with the United States as much more. For lubricating machinery, particularly in steam factories and on railroads in Great Britain, this oil is used more than any or all other articles, being both cheaper and better. There is now a monthly line of steamers from Southampton to the west coast of Af-

rica, the Madeira and Canary Isles. Bristol has fifty-four ships in the trade with that coast; Liverpool thirty-five; and the entire number from Great Britain, both steamers and sailing vessels, is not less than one hundred. Some of these are ships of 1000 tons burden. President Roberts, of Liberia, says twenty ship-loads of palm oil go from Monrovia every year. The import of oils into the United States has been as follows:

	1850.		1855.	
	Gallons.	Value.	Gallons.	Value.
Whale.....	39,669	\$12,864	103,394	\$36,267

Increase....	1,085,000	985,332

The table does not include the domestic catch of whales, but only the whale oil imported mostly from the British Possessions and China. The olive oil in bottles has been estimated in gallons, and is mostly of French origin. The linseed is almost altogether English.—See OLIVE OIL.

Benzole, or *Coal Oil*, is a new discovery of producing oil from certain kinds of bituminous coal. At Cloverport, Kentucky, on the Ohio River, are extensive new works, running twelve retorts night and day, consuming from eight to ten tons of coal every twenty-four hours, and producing 750 gallons of crude oil. Re-distilled, this quantity yields 600 gallons of refined oils; viz., 125 gallons of benzole, 75 of naphtha, 225 of lubricating oil, and 175 of oil for illuminating purposes. Benzole readily sells at \$1 50 per gallon; lubricating oil at \$1 25; naphtha and burning at eighty cents. Preparations are making at Cloverport for the manufacture of a beautiful semi-transparent candle from the substance called "paraffine," resembling spermaceti, and which is formed in pearly crystals in the dark oils of the last distillations after they have cooled. The paraffine, as remarked by Professor Silliman, Jun., does not exist ready formed in the original crude product, but is a result of the high temperature employed in the process of distillation, by which the elements are newly arranged. It derives its name from the unalterable nature of the substance under the most powerful chemical agent. The residuum from the last distillation makes the first quality of asphaltum, used for

smearing vaults, etc., now imported and sold at thirty dollars per ton.

Oil-painting. Painting in which the medium for using the colors is oil. It is said to have been unknown to the ancients, and not used earlier than the fourteenth century; its invention being attributed to John Van Eyck, sometimes called John of Bruges. By him it was supposed to have been imparted to one Antonio da Messina, who first brought it to Venice. Giovanni Bellini, by a stratagem, got possession of the secret from him, and then made it publicly known. Oil-painting has the advantages, above all other modes, of affording great delicacy of execution, a union and insensible blending of the colors, and, above all, that of imparting great force to its effects. The various colors chiefly used in oil-painting are white-lead, Cremnitz white, chrome, king's yellow, Naples and patent yellow, the ochres, Dutch pink, terra da Sienna, yellow lake, vermilion, red-lead, Indian and Venetian red, the several sorts of lake, brown pink, Vandyke brown, burned and unburned umber, ultramarine, Prussian and Antwerp blue, ivory black, blue black, asphaltum. The principal oils are those extracted from the poppy, nut, and linseed. With the latter, driers are introduced.—See PAINTS.

Oldenburg, a state of Germany, in the northwest, with the title of Grand Duchy, composed of three separate portions: 1st. The Duchy of Oldenburg, which forms eight-ninths of the territory. It is surrounded by Hanover on the east, south, and west, and bounded north by the North Sea; capital, Oldenburg; 2d. The Principality of Lübeck, or Eutin, inclosed in the Duchy of Holstein (Denmark); and, 3d. The Principality of Birkenfeld, between Rhenish Prussia and Holstein Homburg; capital, Birkenfeld. Area, 2421 square miles. Population in 1852, 281,923. Oldenburg lies in the basin of the North Sea, and is entirely flat. Soil in general fertile, but in several places are extensive sand dunes and marshes. Corn raised insufficient for consumption. Pasturage excellent; horses, cattle, and sheep extensively reared. Manufactures confined to linen-weaving and coarse woollens. Revenue (estimated), 1854, 891,000 thalers; expenses, 979,000 thalers; public debt, 1,600,000 thalers. *Oldenburg*, the capital, is situated at the conflux of the Hunte with the Haaren, which here forms a small port, eighty miles west-southwest of Hamburg. Population, 7829. It is the residence of the Grand Duke. Population of circle in 1852, 59,453.

Olibanum (Fr. *Encens*; Ger. *Weiranch*; It. *Olibano*; Arab. *Loaban*), a gum-resin, the produce of a large tree (*Libanus thurifera*) growing in Arabia and India. It is imported in chests, containing each about one cwt.; from the Levant and India; the best comes from the former, and is the produce of Arabia. Good olibanum is in semi-transparent tears, of a pink color, brittle, and adhesive when warm. When burned, the odor is very agreeable; its taste is bitterish, and somewhat pungent and aromatic; it flames for a long time with a steady, clear light, which is not easily extinguished, leaving behind a black (not, as has been said, a whitish) ash. Olibanum is the frankincense (*thus*) of the ancients, and was extensively used by them in sacrifices.—PLINY, *Nat. Hist.* It has also been used in the ceremonies of the Greek and Roman churches.—AINSLIE'S *Materia Indica*; THOMSON'S *Chemistry*; KIPPINGH, *Antiq. Rom.*

Olive, Olives (Fr. *Olives*; Ger. *Oliven*; It. *Ulive*, *Olive*; Sp. *Aceitunas*; Port. *Azeitonas*; Lat. *Olive*), a fruit yielding a large quantity of oil, the produce of the *Olea*, or olive-tree. The wild olive is indigenous to Syria, Greece, and Africa, on the lower slopes of Mount Atlas. The cultivated species grows spontaneously in Syria, and is easily reared in Spain, Italy, and the south of France. It has even been raised in the open air in England, but its fruit is said not to have ripened. The fruit is a smooth, oval plum, about three-quarters of an inch in length, and half an inch in diameter; of a deep violet color when ripe, whitish and fleshy within, bitter and nauseous, but replete with a bland oil; covering an oblong, pointed, rough nut. Olives intended for preservation are gathered before they are ripe. In pickling, the object is to remove their bitterness, and to preserve them green, by impregnating them with a brine of aromatized sea-salt;

for this purpose various methods are employed. The wood of the olive-tree is beautifully veined, and has an agreeable smell. It is in great esteem with cabinet-makers, on account of the fine polish of which it is susceptible.

Olive Oil (Ger. *Baumöl*; Fr. *Huile d'olives*; It. *Olio d'uliva*; Sp. *Acete de aceitunas*; Lat. *Oleum olivæ*). The olive-tree is principally cultivated for the sake of its oil. This is an insipid, inodorous, pale greenish-yellow colored, viscid fluid, unctuous to the feel, inflammable, incapable of combining with water, and nearly insoluble in alcohol. It is the lightest of all the fixed oils; and is largely used, particularly in Greece, Italy, Spain, and France, as an article of food, and in medicine and the arts. It is also very extensively used in England, particularly in the woolen manufacture. The ripe fruit is gathered in November, and immediately bruised in a mill, the stones of which are set so wide as not to crush the kernel. The pulp is then subjected to the press in bags made of rushes; and by means of a gentle pressure, the best, or *virgin* oil, flows first; a second, and afterward a third, quality of oil is obtained by moistening the residuum, breaking the kernels, etc., and increasing the pressure. When the fruit is not sufficiently ripe, the recent oil has a bitterish taste; and when too ripe, it is fatty. After the oil has been drawn it deposits a white, fibrous, and albuminous matter; but when this deposition has taken place, if it be put into clean glass flasks, it undergoes no further alteration; the common oil can not, however, be preserved in casks above one and a half or two years. It is sometimes adulterated by the admixture of poppy oil.—*Thomson's Dispensatory*. The best olive oil is said to be made in the vicinity of Aix, in France. That which is brought from Leghorn, in chests containing thirty bottles, or four English gallons, is also very superior; it is known in our markets by the name of Florence oil, and is used mostly for culinary purposes. Olive oil is the principal article of export from the kingdom of Naples.—*See NAPLES*. Apulia and Calabria are the provinces most celebrated for its production. The Apulian is the best, and is preferred by the woolen manufacturers, by whom it is extensively used. By far the largest portion of the olive oil brought to England is in general imported from Italy, principally from Gallipoli, on the east coast of the Gulf of Taranto (which see), whence it is commonly known by the name of Gallipoli oil. But besides Italy, Spain, Turkey, the Ionian Islands, etc., send us large quantities.

Oil Trade of Naples.—The oils of the kingdom of Naples are produced in Apulia, from Bari to its southern extremity, the Capo di Leuca, a district comprising the territories which export from Gallipoli and Taranto; and in Calabria from Rossano, on the Gulf of Taranto, across to Gioja. The whole coast from Gioja as far as Gaeta is covered with olive-trees. They are also abundant in the Abruzzi and the Terra di Lavoro; but Apulia and Calabria furnish by far the greatest quantity of oil. The principal magazines, or *caricatori*, for oil, are at Gallipoli and Gioja. Gallipoli supplies England, Holland, the north of Europe, and, in short, all those countries that require the most perfectly purified oil. It is clarified to the highest degree by merely keeping it in cisterns hollowed out of the rock on which the town is built. The voyages it has to perform being long, it is put into casks so well constructed that it frequently arrives at Petersburg in the heat of summer without the least waste or leakage—an advantage attributed to the seasoning of the staves, which, before they are put together, are well soaked in sea-water.

The oil received into the cisterns in Gallipoli, either belongs to the proprietor, who buys it of the planter, or is received in *deposit* on account of some other party, who gets a receipt (*biglietto di magazzino*) specifying the quantity of the oil received on his account, its quality,

etc. Depositors pay at the rate of 20 grani a year for every salma of oil to the party holding it in deposit, and who is bound to account for it. The *caricatori* of Bari and Monopoli furnish oils for the consumption of Upper Italy and Germany, through the medium of Venice and Trieste. They also draw supplies from Brindisi and Otranto. The *caricatori* of Taranto, of Eastern Calabria or Retromarina, and of Western Calabria, the principal of which is Gioja, furnish supplies for Marseilles, etc. But the *caricatori* now mentioned, having no conveniences for clarification, produce only the thick oils used for soap-making. The oils of Sicily, like those of Tunis, are too thin to be used singly in the making of soap; and, being used only for mixing, are less valuable than most others. A full crop of oil in the province of Terra d'Otranto is supposed to yield about 800,000 salme, or 41,666 tuns. To facilitate transactions, orders or *cedules* are circulated, representing quantities of oil deposited in the provincial *caricatori*. These orders are negotiable, like bills of exchange, and are indorsed by the intermediate holder, who receives their value in cash, without, however, becoming liable for their due satisfaction. The only responsible parties are the drawer and drawee. The latter is obliged to deliver the oil at sight of the order, or to hold it at the bearer's disposal, till the 10th of November for the *caricatori* of Apulia, and till the 31st of December for those of Calabria. If the contract be for time, that is, from one year to another, the oil is usually placed at the purchaser's command on the 1st of March. Purchases for time are effected by means of a contract, wherein the vendor undertakes to deliver the oil by the end of January, on receiving payment of the money; but the oil, as observed above, is not really at the purchaser's disposal before the beginning of March. Hence, in time bargains, the payment of the money precedes the delivery of the oil more than a month: scarce an instance is on record of an engagement of this sort having been broken, and the order is as readily negotiable as any other security. In purchases of oil at command, payment likewise precedes the delivery of the article; but in this case the advance is confined to the five days necessary to transmit the order to the *caricatori* where the oil is kept for delivery. The oil remains in the *caricatori* under the care and responsibility of the vendor, to be delivered on demand to the bearer of the order, free of all costs and charges whatever for the first year; but for every successive year from 25 to 30 grains per salma are charged for keeping, and for renewal of warranty. (We are indebted for these details to a very valuable Report by Mr. Steel, British vice-consul at Gallipoli, and to a brochure of M. Millenet, entitled *Coup de Œil sur le Royaume de Naples*. Naples, 1832.) *For the trade in Olive oil, see article OILS.*

Olive-tree. The wood of the olive is heavy, compact, fine-grained, and brilliant. The sap-wood is white and soft, and the heart-wood hard, brittle, and of a reddish or yellowish tint, with the pith nearly effaced, as in the box. It is employed by cabinet-makers to inlay the finer species of wood, which are contrasted with it in color, and to form light articles of ornament, such as dressing-cases, snuff-boxes, etc. The wood of the roots, which is agreeably marbled, is preferred to that of the trunk. On account of its hardness and durability, the wood of this tree was anciently used for the hinges of doors; and, before metal became common, it was selected by the Greeks for the images of their gods. From its resinous and oleaginous nature, the wood of this tree is exceedingly combustible, and burns as well before as after it is dried. There exudes from its wood a gum, which is sometimes sold for gum-elemi. There is also extracted from this tree a substance called *olivine*. The bark contains a bitter principle, and is regarded as tonic and febrifugal. The leaves are astringent.

The olives are first bruised by a mill-stone, suffi-

ciently hard as not to break the kernels, and are then put into sacks of coarse linen, feather-grass, or of wool, and subjected to heavy pressure, by which means the most fluid and the best liquor is forced out, and is called *virgin oil*. It is received into vessels half filled with water, from which it is skimmed, and put into tubs, barrels, and bottles for use. Several coarser kinds of oil are afterward obtained, by adding hot water to the bruised fruit. The best olive oil is of a bright pale-amber color, without smell, and bland to the taste. Kept warm, it becomes rancid, and at 38° Fahr. it congeals. It is of the same nature as all mild expressed vegetable oils; of these the most fluid are preferred, and hence the oils of olives and of almonds are those chiefly used in medicine. One of the most esteemed kinds of oil is that produced at Aix (*Huile d'Aix en Provence*). *Florence oil* is also a fine kind, imported from Leghorn in flasks surrounded by a kind of network, formed of the leaves of a monocotyledonous plant. These are the kinds of olive oil in most frequent use at the table for salads (hence they are called *Salad oils*). *Lucca oil* is imported in jars holding about nineteen gallons each. *Genoa oil* is a fine kind. *Gallipoli oil* is imported in casks, and constitutes the largest portion of the olive oil imported into England. *Sicily oil* is of an inferior quality. *Spanish oil* is the worst. The foot deposited by olive oil is used for oiling machinery, under the name of *Droppings of Sweet oil*.

Another important advantage afforded by this tree is its fruit in a pickled state. It is gathered unripe, and suffered to steep in water for some days, and is afterward put into a lye of water and barilla, or kali, with the ashes of olive-stones, or with lime. It is then put up in earthen bottles, or in barrels, with salt and water, and in this state is ready for use. Olives are eaten before, as well as after meals, and are believed to excite appetite and promote digestion. The finest kind of prepared fruit is known in commerce by the name of *Picholines*, after one Picholini, an Italian, who first discovered the art of pickling olives. The fruit of the olive is of a pleasant taste, and is eaten by the modern Greeks during Lent, in its ripe state, without any preparation, except with the addition of a little pepper, salt, and oil. From the value of its products, in a commercial point of view, aside from other considerations, the culture of the olive strongly claims the attention of the American agriculturist, and the trial should be made in every place where its failure is not certain, and for this purpose young grafted trees of hardy and choice varieties should be obtained from Europe, and the formation of nurseries immediately begun. A portion of Texas, Louisiana, the islands of Georgia, and chosen exposures of the interior of the last-named State, as well as of some of the Western States, California, or of Oregon, will be the scene of this species of culture, if ever attended with success in North America.—BROWNE'S *Trees of America*.

Omnium, a term used at the English Stock Exchange, to express the aggregate value of the different stocks in which a loan is now usually funded. Thus, in the English loan of £36,000,000 contracted for in June, 1815, the omnium consisted of £180 3 per cent. reduced annuities, £44 3 per cent. consols, and £10 4 per cent. annuities, for each £100 subscribed. The loan was contracted for on the 14th of June, when the prices of the above stocks were—3 per cent. reduced, 54; 3 per cent. consols, 55; 4 per cent., 70; hence the parcels of stock given for £100 advanced, were worth—

	£	s.	d.
£180 reduced, at 54.....	70	4	0
£44 consols, at 55.....	24	4	0
£10 4 per cents., at 70.....	7	0	0
Together.....	101	8	0

which would be the value of the omnium, or £1 8s. per cent. premium, independently of any discount for prompt payment.

Onion (Ger. *Zwiebel*; Fr. *Oignon*; It. *Cipolla*; Sp.

Cebolla; Russ. *Luk*), a well-known bulbous plant (*Allium Ccpa*, Linn.) cultivated all over Europe and the U. States for culinary purposes. The Strasburg, Spanish, and Portuguese varieties are the most esteemed.

Ontario, a lake of New York and Canada, easternmost and smallest in extent of the five great lakes of North America. It is between 43° 10' and 44° N. lat., and between 76° and 88° W. long. It receives Niagara River, the great outlet of the upper lakes, in its southwestern part, and has its outlet by the St. Lawrence River in its northeastern part, in which, immediately below the lake, is the cluster denominated the "Thousand Islands." Its shape approaches to a long and narrow ellipse, being 190 miles long, and 55 wide in its widest part, and about 480 miles in circumference. It is in some places over 600 feet deep, so that its bottom is considerably below the level of the Atlantic. Its surface is 380 feet below the level of Lake Erie, and 134½ feet above tide-water. In every part it has sufficient depth of water for the largest vessels. It has many good harbors, and is rarely frozen excepting in shallow parts near the shore. The principal rivers which enter it from the southern side are the Genesee, Oswego, and Black rivers, and a large number of creeks. The Bay of Quinte is a long and irregular body of water on its eastern part, which receives a considerable river, the outlet of several small lakes, and Burlington Bay is in its western part. Both these bays are in Canada. It has several important places on its shores, the principal of which are Kingston, Toronto, and Coburg, in Canada; and Oswego, Sackett's Harbor, Port Genesee, or Charlotte, in the United States. It is subject to violent storms and heavy swells. It is connected with the Erie Canal by the Oswego Canal, and from thence the Erie Canal forms a navigable communication with the Hudson River, a distance of 209 miles; and much of the trade of New York for the West passes through it and through the Welland Canal, which is 28 miles long, with 27 locks, and admits the passage of the largest vessels which navigate the lakes. This canal commences at Sherbrooke, near the mouth of Grand River, on Lake Erie, and terminates at Port Dalhousie, on Lake Ontario, nine miles west of Niagara village. Its entrance being a considerable distance west of the outlet of Lake Erie, it is open earlier than the Erie Canal at Buffalo, where the ice often accumulates in the spring. The Rideau Canal forms a navigable communication with the Ottawa River, 126 miles. It has 15 light-houses on the American shore, and 13 on the Canadian side.—See LAKES, *Commerce of*.

Onyx (Ger. *Onyx*; Fr. *Onix*, *Onice*; Sp. *Onique*; Lat. *Onyx*). Any stone exhibiting layers of two or more colors strongly contrasted is called an *onyx*, as banded jasper, chalcedony, etc., but more particularly the latter, when it is marked with white, and stratified with opaque and translucent lines. But the Oriental onyx is considered a substance consisting of two or more layers or bands of distinct and different colors. A sard, or sardoine, having a layer of white upon it, would be called an *onyx*; and according to the number of layers it would be distinguished as an *onyx* with three or more bands. Some of the antique engravings are upon onyxes of four bands.—MAWE'S *Treatise on Diamonds, etc.*

Opal (Ger. *Opal*; Fr. *Opale*; It. *Opalo*; Sp. *Opalo*, *Piedra iris*; Port. *Opal*; Lat. *Opalus*), a stone, of which there are several varieties, found in different parts of Europe, particularly in Hungary, and in the East Indies, etc. When first dug out of the earth it is soft, but it hardens and diminishes in bulk by exposure to the air. The opal is always amorphous; fracture conchoidal; commonly somewhat transparent. Hardness varies considerably. Specific gravity from 1.958 to 2.54. The lowness of its specific gravity in some cases is to be ascribed to accidental cavities which the stone contains. These are sometimes filled with drops of water. Some specimens of opal have the property of

emitting various colored rays, with a particular effulgency, when placed between the eye and the light. The opals which possess this property are distinguished by lapidaries by the epithet *Oriental*; and often, by mineralogists, by the epithet *nobilis*. This property rendered the stone much esteemed by the ancients.—THOMSON'S *Chemistry*; see also PLINY, *Hist. Nat. lib. xxxvii. c. 6*, where there are some very curious details as to this stone.

Opium (Ger. *Mohnsaft*; Fr. *Opium*; It. *Oppio*; Sp. and Port. *Opio*; Lat. *Opium*; Arab. *Ufjjoon*; Hind. *Ufeem*; Turk. *Madjoon*), the concrete juice of the white poppy (*Papaver somniferum*), which is most probably a native of Asia, though now found growing wild in the southern parts of Europe, and even in England. Opium is chiefly prepared in India, Turkey, and Persia; but the white poppy is extensively cultivated in France and other parts of Europe, on account of its capsules, and of the useful bland oil obtained from its seeds. It has also been cultivated, and opium made, in England; but there is very little probability of its ever being raised here to any considerable extent. The poppy is an annual plant, with a stalk rising to the height of three or four feet; its leaves resemble those of the lettuce, and its flower has the appearance of a tulip. When at its full growth, an incision is made in the top of the plant, from which there issues a white milky juice, which soon hardens, and is scraped off the plants, and wrought into cakes. In India, these are covered with the petals of the plant to prevent their sticking together, and in this situation are dried, and packed in chests lined with hides and covered with gunny, each containing forty cakes, and weighing two maunds, or 149½ lbs.; they are exported in this state to the places where the opium is consumed. Turkey opium is in flat pieces, covered with leaves, and the reddish capsules of some species of *rumex*, which is considered an indication of its goodness, as the inferior kinds have none of these capsules adhering to them. According to Dr. A. T. Thomson, Turkey opium has a peculiar strong, heavy, narcotic odor, and a bitter taste, accompanied by a sensation of acrid heat, or biting on the tongue and lips, if it be well chewed. Its color, when good, is a reddish brown, or fawn color; its texture compact and uniform. Its specific gravity is 1.336. When soft, it is tenacious; but when long exposed to the air, it becomes hard, breaks with a uniform shining fracture, is pulverulent, and affords a yellowish brown powder. East Indian opium has a strong empyreumatic smell, but not much of the peculiar narcotic, heavy odor of the Turkey opium; the taste is more bitter, and equally nauseous, but it has less acrimony. It agrees with the Turkey opium in other sensible qualities, except that its color is blacker, and its texture less plastic, although it is as tenacious. Good Turkey opium has been found to yield nearly three times the quantity of *morphia*, or of the peculiar principle of the drug, that is yielded by East Indian opium. Opium is regarded as bad when it is very soft, greasy, light, friable, of an intensely black color, or mixed with many impurities. A weak or empyreumatic odor, a slightly bitter or acrid, or a sweetish taste, or the power of marking a brown or black continuous streak when drawn across paper, are all symptoms of inferior opium.—*Dispensatory*. The raising of opium is a very hazardous business; the poppy being a delicate plant, peculiarly liable to injury from insects, wind, hail, or unseasonable rain. The produce seldom agrees with the true average, but commonly runs in extremes; while one cultivator is disappointed, another reaps immense gain. One season does not pay the labor of the culture; another, peculiarly fortunate, enriches all the cultivators. This circumstance is well suited to allure man, ever confident of good fortune.—COLEBROOKE'S *Husbandry of Bengal*.

The Opium Trade.—This drug is chiefly grown in British India, where it has long been a strict monop-

oly of the government, and also in Persia and Turkey. It was first imported into China by the Portuguese; but up to the year 1768 the whole quantity imported did not exceed from 100 to 200 chests annually. The East India Company commenced its importation in 1773-'4; and in 1780 small dépôts for its sale were established a little south of Macao. The trade continued to increase rapidly from India until 1794, when large English ships found it profitable to anchor near Whampoa, for fifteen months at a time, selling opium. In 1800 its sale had risen to about 2000 chests; but recently its further importation into China was prohibited. Since that period the smuggler succeeds the legal importer; and although the importation is no longer conducted in the vessels of the East India Company, it is extensively cultivated under their monopoly, and sold by them to private traders, by whom it is introduced into the prohibited markets of China.

Consumption and Trade of Opium in China.—Opium is pretty extensively used, both as a masticatory and in smoking, in Turkey and India; but its great consumption is in China and the surrounding countries, where the habit of smoking it has become almost universal. The Chinese boil or seethe the crude opium; and by this process the impurities, resinous and gummy matter, are separated, and the remaining extract only is reserved for use. Thus prepared, the drug loses its ordinary strong and offensive aromatic odor, and has even a fragrant and agreeable perfume. A small ball of it, inserted in a large wooden pipe with some combustible matter, is lighted, and the amateur proceeds to inhale four or five whiffs, when he lies down and resigns himself to his dreams, which are said to have no inconsiderable resemblance to the sensations produced by inhaling the oxyd of azote. Those who do not carry the indulgence to excess do not, it is said, experience any bad effects from it. Nine-tenths of the supplies of opium for the consumption of China have always been derived from India, a comparatively small quantity only being derived from Turkey. The trade has always been contraband, the introduction of the drug having been prohibited by the Chinese government. Until about 1810 the trade had not attracted much attention, or become of any very great importance, but it has since been very greatly extended, and has been since 1828 of first-rate consequence. The trade was at first carried on at Whampoa, about fifteen miles below Canton; next at Macao, whence it was driven by the exactions of the Portuguese; and thereafter in the Bay of Lintin. Here the opium is kept on board ships, commonly called receiving ships, of which there are often ten or twelve lying together at anchor. But latterly the trade has been carried on all along the southeast coast of China, by means of a species of fast-sailing vessels called "clippers," built expressly for the trade and strongly armed. The sales are mostly effected by the English and American agents in Canton, who give orders for the delivery of the opium; which, on producing the order, is handed over to the Chinese smuggler, who comes along side at night to receive it. Frequently, however, the smuggler purchases the opium on his own account, paying for it on the spot in silver; it being a rule of the trade, never departed from, to receive the money before the drug is delivered. During the first ten years of the present century the exports of opium from India to China averaged about 2500 chests, of 149½ pounds each. But after the introduction of Malwa opium into the markets of Bombay and Calcutta, the exports began rapidly to increase.

According to the *Friend of India* of Calcutta, October, 1855, the opium sales for the five preceding years were as follows:

1849-'50...	Chests sold, 35,383....	Proceeds, 35,432,000 Rs.
1850-'51...	" 34,409....	" 32,250,000 "
1852 ...	" 33,561....	" 37,245,000 "
1853 ...	" 39,463....	" 38,348,000 "
1854 ...	" 48,319....	" 36,727,000 "

The price paid to the cultivator is about Rs. 240 a chest.

AN ACCOUNT OF THE QUANTITIES AND PRICES (EXCLUDING FRACTIONS) OF THE DIFFERENT SPECIES OF EAST INDIA OPIUM IMPORTED INTO CHINA FROM THE SEASON 1816-1817, DOWN TO THE SEASON 1837-1838, WHEN THE TRADE WAS INTERRUPTED.

From April 1st to March 31st.	Number of Chests.	Value in Dollars.
1816-17.....	3,210	3,057,004
1817-18.....	3,680	3,904,350
1818-19.....	4,580	4,151,250
1819-20.....	4,600	5,583,200
1820-21.....	4,770	8,400,800
1821-22.....	4,628	8,314,600
1822-23.....	5,822	7,983,930
1823-24.....	7,082	8,515,100
1824-25.....	8,655	7,679,625
1825-26.....	9,621	7,608,205
1826-27.....	9,969	9,610,085
1827-28.....	9,535	10,425,075
1828-29.....	12,132	12,535,115
1829-30.....	14,000	12,057,157
1830-31.....	18,760	11,904,263
1831-32.....	13,503	10,931,605
1832-33.....	23,670	15,322,759
1833-34.....	19,786	13,056,540
1834-35.....	16,514	9,655,010
1835-36.....	16,735	10,539,875
1836-37.....	21,609	14,287,330
1837-38.....	20,049	10,893,157

Confiscation of Opium in 1839.—Opium has always been prohibited in China, and consequently its importation has always been looked upon as a smuggling speculation. There would seem, however, to be good grounds for thinking that the prohibition of the importation of opium was all along intended to be more apparent than real. At all events, it is certain that the trade grew gradually up, from a small beginning, to be one of great extent and value; and it is contradictory and absurd to suppose that this should have been the case had it encountered any considerable opposition from the Chinese authorities. But the truth is, that these functionaries, instead of opposing the trade, or even merely conniving at it, were parties to its being openly carried on, and received certain regulated and large fees on all the opium that was imported. It has even been alleged that a part of these fees found its way into the Imperial treasury at Peking, though that is more doubtful. The appetite for the drug increased with the increasing means of gratifying it; and there appeared to be no assignable limits to the quantity that might be disposed of in the empire. The rapid extension of the trade seems at length to have drawn the attention of the court of Peking to the subject. We doubt, however, notwithstanding what has been alleged to the contrary, whether a sense of the injurious consequences of the use of the drug had much to do in the matter. This, indeed, is a part of the subject as to which there exists a great deal of misapprehension; and we are well assured that, provided it be not carried to excess, the use of opium is not more injurious than that of wine, brandy, or other stimulants. The alarm of the Chinese government was probably not so much about the health or morals of its subjects as about their bullion! They are still haunted by the same visionary fears of being drained of a due supply of gold and silver, that formerly haunted the people of this country. The imports of opium having increased so rapidly as to be no longer balanced by the exports of tea and silk, sycee silver began also to be exported! The paternal government of Peking might have tolerated what are called the demoralizing effects of opium with stoical indifference, but the exportation of silver was not a thing to be endured. It is, however, only fair to state that the Chinese statesmen are not all of the school of Mun and Geo, and that some of them appear to have taken an enlightened view of the question, and to have emancipated themselves from the prejudices that still influence the majority of their colleagues. The statesmen in question contended that, whether the use of the drug were injurious or not, the taste for it was too deeply seated and too widely diffused to admit of its effectual prohibition; and they, therefore, pro-

posed that its importation should be legalized, subjecting it, at the same time, to a heavy duty. There can not be a doubt that this was the proper mode of dealing with the subject. In the end, however, the government of Peking, influenced by unfounded theories as to the mischievous effect of the export of the precious metals, came to a different conclusion, and resolved to put a stop to the traffic. No sooner had this resolution been adopted, than a most extraordinary change appears to have taken place in the conduct of the Chinese authorities; and their usual caution seems to have wholly deserted them. They now became as precipitate and violent as they had previously been slow and circumspect; and resolved at all hazards to attempt forcibly to put down the trade. To accomplish this, all foreigners were, in March, 1839, prohibited from leaving Canton; and compulsory measures were at the same time resorted to for compelling them to deliver up the opium in their possession. How the affair might have ended, had the English at Canton been left to the exercise of their own judgment in this crisis, it is impossible to say; but we have been assured by those on whose statements we are disposed to rely, that they would most probably have succeeded in getting out of it with comparatively little loss. Instead, however, of acting for themselves, they had to act in obedience to the orders of Mr. Elliot, chief superintendent of the British trade in Canton; and he, while under constraint, occasioned by confinement to the factory, commanded all the opium belonging to British subjects to be given up to him for delivery to the Chinese authorities; declaring, at the same time, that "failing the surrender of the said opium," the British government should be free "of all measures of responsibility or liability in respect of British-owned opium."

We do not presume to offer any opinion as to the necessity or policy of this proceeding on the part of the superintendent; but in consequence thereof, and of the unjustifiable proceedings of the Chinese, above 20,000 chests of opium were delivered up to Mr. Elliot by British subjects, and by him to the Chinese authorities; and the latter, not satisfied with the possession of the opium, which it was their duty to have placed in a state of security till the matters with respect to it should be arranged, immediately proceeded to destroy it! Having succeeded thus far, the Chinese next insisted that the foreign merchants should subscribe a bond, pledging themselves not to import opium into any part of China; or that, if they did, they were to be justly liable to the penalty of death. But this condition being refused, and no arrangement having been come to, Mr. Elliot suspended the trade on the 22d of May. Our readers do not require to be told that a war with China grew out of these extraordinary proceedings.

Indemnity for the Opium destroyed in China.—The question as to the amount of the compensation that should be awarded to the parties who delivered up the opium to the superintendent in China has since attracted considerable attention. The merchants contended that they were entitled to its cost, or to the price at which it had been invoiced to them, or to above £2,300,000. It is, however, admitted on all hands that the price of opium is exceedingly fluctuating, and that it is influenced in a very high degree by variations in the facilities for smuggling into China. And it was contended by government, that such were the obstacles thrown in the way of its clandestine importation when the delivery was made in 1839, that the price of opium had fallen to less than half its invoice cost, and that supposing the merchants had retained it, they must necessarily have sustained a very heavy loss. Having taken this view of the matter, government proposed that indemnity should be made at the rate of £64 per chest (£1,250,000 in all), being (though little more than half the sum claimed) considerably above the current price of opium in Canton previously

to its being delivered up. As might have been expected, this decision was much found fault with. On the whole, however, we think it eminently fair and reasonable. No one doubts, though not a pound of the opium had been delivered up to Captain Elliot, that its owners must, in consequence of the increased difficulties in the way of its sale, have lost heavily; and, under the circumstances, we see no ground for contending that government was bound, because their agent had interfered, to place the merchants in a better position than they would have been in but for that interference. All that they could justly require was, that it should not be permitted to injure them.

Cultivation of Opium in India—Monopoly—Revenue, etc.—Opium is produced in Bengal, principally in the provinces of Bahar and Benares, in parts of Bombay, and in Malwa, in Central India. In Bengal the production of opium is a monopoly, no person being allowed to grow the poppy except on account of government. The latter make advances to the cultivators, who deliver the entire produce into their hands at a fixed price of about 3s. 6d. per lb. It is afterward sold by the Company for about 11s. per lb., so that the profit of the latter amounts to about 7s. 6d. per lb. Opium may be grown and manufactured in Bombay; but it is subjected to the same high duty that is imposed on opium imported into the Presidency. The object of this high duty is to "discourage its production." Government purchase what little is produced in Bombay, supplying through licensed dealers all that is required for home consumption. The poppy is extensively cultivated in Malwa, in Central India, and yields a large revenue. Down to 1831, it was produced under a monopoly. But in that year the business was thrown open to the public, and the revenue collected by imposing a duty on the opium when passing through the Company's territories to Bombay. The capture of Scinde, by closing the route for the smuggling of opium through Kurachee to the Portuguese settlements of Demaun, etc., enabled a large addition to be made to the transit duty on Malwa opium, which was raised in 1847 to 400 rupees per chest, affording a revenue to government of about 6s. 8d. per lb.—(We have borrowed these authentic details from the Official Papers relative to India, p. 73-75, published in 1853.) No one doubts that opium is an excellent subject for taxation; and the higher the rate to which the duty on it can be raised without encouraging smuggling, so much the better. But a great deal has been said for and against the system under which the opium revenue is raised in Bengal and other parts of India; and perhaps it might be the better policy to open the culture of the plant to the unfettered competition of the public, imposing a high duty on the drug when grown or when exported. Without, however, entering on the discussion of this difficult question, we may shortly observe that the monopoly does not appear to have the consequences stated by Mr. Colebrooke; who tells us (*Husbandry of Bengal*, p. 118) that, except in a few situations that are peculiarly favorable, its culture is unprofitable; and that the peasants engage in it with reluctance, being tempted thereto only by the advances made by the government agents. But if such were the case formerly, it would seem that circumstances have changed in the interval; for it appears from the official accounts that the production of Bengal opium, which amounted to 17,858 chests of 160 lbs. each in 1840-41, had increased to about 36,000 chests in 1848-49. The number of chests of Malwa opium (140 lbs. each) exported from Bombay during the same period has continued pretty stationary at about 16,000 a year. The whole, or nearly the whole, of this immense supply of above 50,000 chests, is sent to China. Latterly it has produced to the government of India a clear revenue of considerably more than £3,000,000 sterling a year.

It is very doubtful whether the use of opium, when taken in moderate quantities, be so injurious as has

been represented. That it may, like spirits and wine, be abused, is abundantly certain; but it has not been shown that it is more liable to abuse than either of these articles. And the Chinese, by whom it is principally consumed, are a highly industrious, sober, frugal people.

It is computed that, had China no silk nor teas to give in part payment for the opium consumed in the Celestial empire, the drain of specie during the last 30 years would have amounted to \$600,000,000. It is stated in a memorial presented to the Emperor of China, on the subject of the opium trade, that the drain from the imperial treasury, to supply this destructive luxury, was,

From 1829 to 1831.....	\$24,000,000
" 1831 to 1834.....	28,000,000
" 1834 to 1838.....	40,000,000

The latter sum, it is stated, is about the average annual outlay at the present time; and it is considered by an intelligent commercial correspondent at Macao quite problematical whether the Chinese would have taken more cotton goods and other imports from the United States and England, had they not expended so much for opium. The profits of the East India Company, who are entitled to whatever of credit or discredit may attach to keeping up this lucrative trade in opium, are stated at \$18,000,000 per annum. If the company succeed in opening new markets for the drug (and it is represented that they are establishing retail shops all over the Indian empire), they will be amply reimbursed for their diminished importations into China, since the importation of Turkish opium in American bottoms has so considerably interfered with their previously almost exclusive monopoly of this trade. It should be added, that the importation of opium into China, though illegal, is openly tolerated by the Chinese officials, and no difficulty is experienced in finding cash customers for any quantity imported. From 200 chests in 1756, when the trade was legal, the importation has risen to from 70,000 to 80,000 chests per annum in 1856, when its introduction is prohibited by law. The value of opium imported in 1756 was about \$1,000,000; the value at the present day has risen to \$40,000,000. The basis of foreign exchange with China is as follows: General imports, opium (which makes about 30 per cent. of the whole), bullion and specie, or drafts on London.—*Commercial Relations of the United States*, 1856-57.

Cultivation in the United States.—A variety of the "Common" or "Opium Poppy" (*Papaver somniferum*), indigenous to the warm and temperate parts of Europe and Asia, from Portugal to Japan, and especially cultivated in China, India, Turkey, Egypt, and in the Morea, has been introduced into the United States, and has proved itself susceptible of easy cultivation on very rich soils, and is well adapted to the climate of the Middle and Southern States. The flowers of the "White Poppy" (*Papaver s. alba*), the variety with which the experiment was made, may be either entirely white or red, or may be fringed with purple, rose, or lilac, variegated and edged with the same colors, but never occur blue nor yellow, nor mixed with these colors, each petal being generally marked at the bottom with a black or purple spot. The seeds are black in the plants having purple flowers, and light-colored in those which are white; although the seeds of the latter, when of spontaneous growth, are sometimes black. The largest heads, which are employed for medical or domestic use, are obtained from the single-flowered kind, not only for the purpose of extracting opium, but also on account of the bland, esculent oil that is expressed from the seeds, which are simply emulsive, and contain none of the narcotic principle. For the latter purpose, if no other, its culture in this country is worthy of attention.

With regard to the cultivation of this plant, with the view of obtaining opium, there can be but little

doubt that our clear sky, fervid summer sun, and heavy dews would greatly favor the production of this article; but how far these circumstances, in connection with American ingenuity in devising improved methods for its extraction, would allow us to compete with the cheapness of labor in the East, can only be determined by actual trial. Certainly it is an object worthy of public encouragement, as the annual amount of opium imported into the United States is valued at upward of \$407,000, a considerable portion of which might be saved, and thereby add to our resources. Besides, if we were to raise a surplus, it could be sent to China in exchange for tea. The successful cultivation of the plant, however, requires the provision of good soil, appropriate manure, and careful management. The strength of the juice, according to Dr. Butler, of British India, depends much upon the quantity of moisture of the climate. A deficiency even of dew prevents the proper flow of the peculiar narcotic, milky juice, which abounds in almost every part of the plant, while an excess, besides washing off this milk, causes additional mischief, by separating the soluble from the insoluble parts of this drug. This not only deteriorates its quality, but increases the quantity of moisture, which must afterward be got rid of.

STATEMENT SHOWING THE IMPORTS OF OPIUM INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1856.

Whence Imported.	Pounds.	Value.
England.....	113,330	\$272,608
British East Indies.....	1,000	4,626
Sardinia.....	55	100
Austria.....	1,310	2,556
Turkey in Asia.....	9,457	26,508
China.....	32,062	179,358
Total.....	157,814	\$485,846

Besides the works previously referred to, we have consulted, in compiling this article, AINSLIE'S *Materia Indica*; MILBURN'S *Oriental Commerce*; WILKINSON'S *Commerce of Bengal* (J. R. McCulloch); *American Annals*, 1841, p. 63; *Patent Office Report*, 1853; HUNT'S *Merchants' Magazine*, ii. 386, iv. 9 (F. WHARTON), xxiii. 28, 147; *Eclectic Review*, vi. 458; FRASER, xxi. 365; NILES' *Register*, xxiii. 249; *China War and Opium Trade*; *Commercial Relations of the United States*, 1856.

Opoanax (Ger. *Opoanax*; Fr. *Opoanax*; It. *Oppomasso*; Sp. *Opopanax*; Arab. *Jawesheer*), a gum-resin obtained from the *Pastinaca Opopanax*, a species of parsnep. It is a native of the south of Europe and Asia Minor. The stem rises to the height of four or five feet, with a thick branched yellow-colored root. The roots being wounded, a milky juice flows from them, which, being dried in the sun, is the opoanax of the shops. It is in lumps of a reddish yellow color, and white within. Smell peculiar. Taste bitter and acrid. Specific gravity, 1.622. It is imported from Turkey. Being used only to a small extent in medicine, the consumption is inconsiderable.—THOMSON'S *Chemistry*; AINSLIE'S *Materia Indica*.

Oporto, or Porto, a large city and sea-port of Portugal, on the north bank of the Douro, about two miles from its mouth, lat. 41° 10' 30" N., long. 80° 37' 18" W. It is a beautifully situated, well-built city, and is supposed to contain, including the suburbs of Villanora and Gaya, on the opposite bank of the river, about 80,000 inhabitants. The harbor of Oporto is a bar harbor, and can only be entered, at least by vessels of considerable burden, at high water; and it is seldom at any time practicable for vessels drawing more than sixteen feet. On the north side of the entrance is the castle of St. Joao de Foz, whence a ledge of rocks, some of which are at all times above water, extends in a southwest direction. The outermost of these rocks, named Filgueira, which is always visible, is left on the left or larboard side on entering. Cabedelo Point, forming the southern extremity of the entrance, is low and sandy. The bar being liable, from

the action of the tides, and of sudden swellings or *freshes* in the river, to perpetual alterations, it is exceedingly dangerous for any vessel to attempt crossing it without a pilot. Pilots are always on the alert, and ready to offer their services when a vessel comes in sight, unless the weather be so bad that they can not go off. On some few occasions of this sort, vessels have been detained for three weeks off the port, without having an opportunity of entering. The chapel of St. Catherine in a line with that of St. Michael leads over the bar. The ordinary rise of spring tides is from ten to twelve feet, and of neaps from six to eight feet. A light-house with a revolving light, having the lantern 220 feet above the level of the sea, is erected on rising ground about 600 yards north-northwest of St. Joao de Foz. The swellings of the river, or *freshes*, as they are called, most commonly occur in spring, and are caused by heavy rain, and by the melting of the snow on the mountains. The rise of water at such times is frequently as much as forty feet; and the rapidity and force of the current are so very great, that no dependence can be placed on anchors in the stream. Fortunately, a *fresh* never occurs without previous warning; and it is then the practice to moor with a cable made fast to trees, or stone pillars erected on the shore for that purpose.—For further information as to the harbor of Oporto, see PURDY'S *Sailing Directions for the Bay of Biscay*.

Oporto is the emporium of a large portion of the kingdom of Portugal, and enjoys a pretty considerable foreign commerce. The well-known red wine, denominated Port, from its being exclusively shipped at this city, forms by far the largest article of export. The exports vary in different years, from about 26,000 to above 40,000 pipes. England is much the largest consumer of port. The high discriminating duties on French wine originally introduced port into the British markets, and gave it a preference to which, though an excellent wine, it had no just title; this preference first generated, and its long continuance has since so confirmed the taste for port among the great bulk of the population, that it bids fair to maintain its ascendancy as an after-dinner wine, notwithstanding the equalization of the duties. At an average of the nine years ending with 1851, there were shipped from Oporto for England 22,861 pipes a year. Next to England, Brazil, Russia, and the north of Europe are the principal consumers of port; but it appears, from the subjoined account, that the total exports to them do not amount to a half of those sent to England. The other exports are oil, oranges, and other fruits, wool, refined sugar, cream of tartar, shumac, leather, cork, etc. The imports are corn, rice, beef, salt fish, and other articles of provision; sugar, coffee, etc., from Brazil; cotton and woolen goods, hardware, tin plates, etc., from England; hemp, flax, and deals, from the Baltic, etc. Besides the British manufactured goods imported into Portugal for the use of the natives, a considerable quantity is destined for the consumption of Spain; being smuggled into that country through Braganza and other towns on the frontier.

Oranges (Ger. *Pomeranzen*; Du. *Orangen*; Fr. *Oranges*; It. *Melorange*; Sp. *Naranjas*; Russ. *Pomeranzevii*; Hind. *Narangs*; Malay, *Sinoo-manis*), the fruit of the orange-tree. The common or sweet orange (*Citrus sinensis*, or *Citrus nobilis*), and the Seville, or bitter orange (*Citrus aurantium*), are natives of China; and the Portuguese are entitled to the honor of having transferred the plant to other countries. Particular species of *Citrus* seem to be indigenous to various Eastern countries; but the birth-place of the proper orange may be distinctly traced to China. It is now to be found in our green-houses. Oranges are imported in chests and boxes, packed separately in paper. The best come from the Azores, Spain, and Cuba; very good ones are also brought from Portugal, Italy, Malta, South America, and other places.

The orange trade carried on by this country is of considerable value and importance. Oranges are not much more expensive than most of our superior domestic fruits, while they are, perhaps, the most refreshing and wholesome of those of warmer climates.

The *Citrus aurantium*, or golden-fruited orange-tree, under favorable circumstances, usually attains a height of twenty-five or thirty feet, and is graceful in all its parts. The trunk is upright, and branches into a regular or symmetrical head. The bark of the twigs is of a soft and almost translucent green, while that of the trunk and older branches is of a delicate ash-gray. The leaves are moderately large, beautifully shaped, of a fine healthy green, and shining on the upper sides, while the under sides have a slight appearance of down. The flowers occur in little clusters on the sides of the branches, are pleasing in their form, of a delicate white in the sweet oranges, and in the more acid varieties slightly tinged with pink. In some plants they have a more powerful odor, and are, for the moment, more rich; but in the orange-grove there is a fragrance in the aroma which never satiates nor offends; and as the tree is at one and the same time in all stages of its bearing—in flower, in fruit just set, and in golden fruit, inviting the “hand to pull and the palate to taste”—it is hardly possible to conceive or imagine any object more delightful. There is something, too, peculiar in the organization of the fruit of this tree. Its rind, or external covering, is of a spongy texture, containing but little juice or sap of any kind in its substance; but the external surface is covered, or tuberculated with little glands, which secrete an acid, volatile oil, very

inflammable, and of a strong, pungent taste. The interior of the fruit is usually divided into from nine to twelve carpels or cells, which contain the pulp, seeds, and juice, and are united by a whitish pellicle or leathery skin, radiating from the centre to the rind, and may easily be separated without wasting the juice. The seeds are solitary or several, and are attached to the inner angle of the carpel, and in some varieties are entirely wanting.

The wood of the orange-tree, when dry, weighs forty-four pounds to a cubic foot, is hard, compact, flexible, slightly odoriferous, and is susceptible of being polished. When recently cut, it is of a yellowish hue, but in the course of time it fades. From its scarcity and small size, it is but little employed in the arts, the only particular uses to which it is applied being to make boxes, dressing-cases, and other articles of fancy; and in Florida, considerable quantities of straight, young shoots are cut, and shipped in bundles, to be made into walking-canes.

The fruit of the orange may be obtained fresh in any region of the globe, and at almost every season of the year. The aromatic oil and the rind preserve it from the effects both of heat and of cold; and the acidity of the former renders it proof against the attacks of insects. It is true that oranges decay, like other fruit; but that does not happen for a long time, if the rind remains uninjured, and they are kept from humidity, and so ventilated as not to ferment. With regard to the quality of this fruit in various places, there appears to be a diversity of opinion. Some consider those of Malta the best; others those of St. Michael's; while others prefer those of Bahia, Havana, or of St. Augustine.

The *Maltese oranges* are usually large, the rind thick and spongy, and the glands which secrete the volatile oil are prominent. The pulp is red and delicious, although sometimes there is a trace of bitterness in their taste. They are shipped in boxes of an irregular size, and are generally packed in shavings or saw-dust.

The *St. Michael's oranges* are of a small size, the rind is thin and smooth, the glands small, which secrete but little volatile oil, the pulp light-colored, and of a delicious, sugary taste. They are put up in boxes of three hundred and fifty to four hundred, with each fruit enveloped in paper, or in the husks of maize.

The celebrated *Navel oranges* of Bahia are of difficult transport to Europe and the United States, in consequence of the length of the voyage, and of the humidity and warmth of the climate through which they have to pass. If they are gathered green, however, and suspended in the air above deck, or at the stern of the vessel, in netting, they will endure through the voyage.

The *Havana oranges* are usually of a good size, with a moderately rough rind, and a pulp well filled with delicious juice. From the shortness of the voyage to any of the American markets, they may be safely transported during the winter months. The fruit is ripe in Cuba at the end of October, and is usually shipped in barrels of two hundred and fifty to four hundred fruits in each, put up loosely, without any envelopes.

The *St. Augustine oranges* are superior, both in size and quality, to those of Cuba or the Mediterranean. They resemble those of Havana in flavor, but are much larger, and bring from twenty to thirty per cent. more in the New York and Boston markets. Of the smaller sizes, it requires about three hundred fruits to fill a barrel, but of the largest ones only one hundred are necessary.

In Europe, the *Valencia oranges* are eagerly sought after, on account of their early appearance, large size, and beautiful color. They are put up in boxes of two hundred and twenty to two hundred and forty fruits in each, enveloped in brown paper.

The *Sicilian oranges*, and those of the south of Italy, may be regarded as nearly of the same quality. They

are of a medium size, with a fine color, and are rather acid in their flavor. Those shipped from Messina are put up in boxes of two hundred to two hundred and ten fruits in each, and those of Palermo, which mature later, are shipped in boxes of three hundred or more fruits in each. The oranges of Reggio ripen very early, so much so, that it is not unusual to send them away by the 20th of October. They are packed in boxes of two hundred and forty fruits in each, and, like most of the oranges of the Mediterranean, are enveloped in paper.

The *Provence oranges* come to great perfection, and may be classed with those of Genoa. Along the River Var, they have two harvests of the orange, the first commencing from the 10th to the 15th of November, when the fruit begins to turn, and continues till the 4th of December; the second begins about the 10th of January, and is prolonged nearly to the end of February. They are put up in boxes of one hundred and twenty to three hundred and sixty fruits in each, according to their size and qualities.

With the *Seville oranges* may be classed those of Faro, St. Ubes, Oporto, Andalusia, Malaga, and the bitter oranges of Cuba and Florida. This fruit is usually of a good size, of a beautiful color, but unfit to eat, on account of its bitter flavor. Those shipped from Seville are put up in large boxes, of one thousand fruits in each; while those of Faro and St. Ubes are badly packed in cases of three hundred to three hundred and fifty in each. Those of Spain and Portugal are principally carried to England and the Baltic, and are employed in cookery, and in the manufacture of cordials and other aromatic liquors. The essential product of the fruit is in the rind or peel; it is cut into quarters, separated from the pulp, and caused to be quickly dried. It is used in Holland in aromatizing a liquor called *curaçao*.—BROWNE'S *Trees of America*.

Orchilla Weed, Orchella, or Archil (Ger. *Orseille*; Fr. *Orseille*; It. *Oricello, Orcella*; Sp. *Orchilla*), a whitish lichen (*Lichen orchella*) found in the Isle of Portland; but that which is used is imported from the Canary and Cape de Verd Islands, Madeira, Barbary, and the Levant. From it is obtained the archil, or orchal, of commerce, which yields a rich purple tincture, fugitive, indeed, but extremely beautiful. The preparation of orchilla was long a secret, known only to the Florentines and Hollanders; but it is now extensively manufactured in England. Orchil is generally sold in the form of cakes, but sometimes in that of moist pulp; it is extensively used by dyers; and in times of scarcity the weed or lichen has sold as high as £1000 per ton!—THOMSON'S *Dispensatory*.

Ordinary, in *Nautical language*, denotes the establishment of the persons employed by government to take charge of the ships of war which are laid up in the several harbors. These are principally composed of the warrant officers of the ships, as the gunner, boatswain, carpenter, deputy purser, and cook. There is, besides, enrolled in the list of the ordinary a crew of laborers, who pass from ship to ship occasionally, to pump, moor, move, and clean them, whenever it is necessary. The term *ordinary* is also applied sometimes to the ships themselves, and it is likewise used to distinguish the inferior sailors from the most expert and diligent. The latter are rated *able* on the navy books, and have higher pay than those who are rated as *ordinary*.

Oregon, territory, United States of America, bordering the Pacific coast, lies between the parallels of 42° and 46° 10' N. lat., and west of the Rocky Mountains. Area, 210,000 square miles. Much of this territory is mountainous, but it abounds in fertile valleys. It forms three sections, separated from each other by nearly parallel ridges, and following the general direction of the coast line. These several sections have each distinct characteristics of soil, productions, and climate. The division extending from the Pacific coast to the Cascade range has a genial climate throughout the year. The valley of the Willamette is exceedingly fertile, the intervalles and prairies form the best of farming lands, and the uplands afford good pasturage, and abound with valuable timber; and there is much fertile land bordering the Shastl and Umpqua rivers. The division between the Cascade range and the Blue Mountains has generally a light sandy soil, but with many valleys of rich alluvion; altogether said to be a fine grazing region. The portion lying west of the Rocky Mountains and east of the Blue Mountains, in extent full one half of the territory, is mostly a rocky and rough country, with some few narrow valleys of great fertility. In the southern portion of the territory gold has been extensively found. There were in Oregon and Washington territories in 1850, 132,857 acres of land improved, and 299,951 of unimproved land in farms. Cash value of farms, \$2,849,170; and the value of implements and machinery, \$183,423. *Live Stock*: Horses, 8056; asses and mules, 420; milch cows, 9427; working oxen, 8114; other cattle, 24,188; sheep, 15,382; swine, 80,235. Value of live stock, 1,876,189.

Agricultural Products, etc.—Wheat, 211,943 bushels; rye, 106; Indian corn, 2918; oats, 61,214; peas and beans, 6566; potatoes, 91,326; value of products of the orchard, \$1271; produce of market gardens, \$90,241; pounds of butter made, 211,464; of cheese, 36,980; molasses, 24 gallons; wool, 29,686 pounds produced; flax, 640; tobacco, 325; hay, tons of, 378; clover and other grass seeds, 26 bushels. Value of slaughtered animals, \$164,530.—See *Census Returns*, 1850.

The Columbia forms its north boundary for a distance of 300 miles, and the east part is almost entirely drained by the south branch, called Saptin or Lewis River, and its tributaries; a very small portion only in the southeast corner is drained by the head sources of the Rio Colorado, here called Green River; and also by

the Bear River of Great Salt Lake; Umatillah, John Days, and Willamette rivers enter the Columbia River on the south; and the Shastl or Rogue, Umpqua, Sequatchie, Yaquina, Kilamook, and several small streams enter the Pacific on the west. The principal places are Salem, the capital, Portland, at the head of navigation, Oregon city, and Astoria. The principal articles of export are lumber and agricultural produce. Tonnage in 1853, 1063 tons. There were in the territory in 1850, thirty-seven saw-mills employed in the manufacture of lumber. The fisheries of Oregon are important and valuable. The rivers abound with salmon, especially the Columbia and the Willamette, which are taken in large quantities below the fall. The hunting and trapping of the fur-bearing animals has given employment to a great number of persons, and the rivers and coasts abound with wild fowls. The governor is appointed by the President of the United States for four years. The Legislative Assembly is composed of a council of nine members, elected for three years, and a House of Representatives of eighteen members, elected annually. The elective franchise is enjoyed by every free white male inhabitant twenty-one years of age, and a citizen of the United States.

On the 7th of May, 1792, Captain Robert Gray, in the ship *Columbia*, of Boston, discovered and entered the Columbia River; to which he gave the name of his vessel. He was the first person that established the fact of the existence of this great river, and this gives to the United States the right of discovery. In 1804-'5, Captains Lewis and Clarke, under the direction of the government of the United States, explored the country from the mouth of the Missouri to the mouth of the Columbia, and spent the winter of 1805-'6 at the mouth of the Columbia. This exploration of the River Columbia, the first ever made, constitutes another ground of the claim of the United States to the country. In 1808, the Missouri Fur Company, at St. Louis, established a trading post beyond the Rocky Mountains, on the head-waters of Lewis River, the first ever formed on any of the waters of the Columbia. In 1810, the Pacific Fur Company, under John Jacob Astor, of New York, was formed; and in 1811, they founded Astoria, at the mouth of the Columbia, as the principal trading post, and proceeded to establish others in the interior. A little later in the same year, the Northwest Company sent a detachment to form establishments on the Columbia; but when they arrived at the mouth of the river, they found the post occupied. In consequence of the exposure of Astoria by the war of 1813, the post was sold out to the Northwest Company. At the close of the war, Astoria was restored, by order of the British government, to its original founders, agreeably to the first article of the Treaty of Ghent; but Britain still persisted in claiming this territory, south to the 42d degree of latitude, until 1845. In 1821, the Hudson's Bay and Northwest Company, who had previously been rivals, were united, and since that time have greatly extended their establishments in the region of Oregon. It was held in joint occupancy until the treaty of 1845, when Britain gave up all claims south of the 49th parallel of north latitude. It was organized with a territorial government in 1848. The portion now the Territory of Washington was set off by an act of Congress, March, 1853.

Organs. The invention of the organ is attributed to Archimedes, about 220 B.C.; but the fact does not rest on sufficient authority. It is also attributed to one Ctesibius, a barber of Alexandria, about 100 B.C. The organ was brought to Europe from the Greek em-

pire, and was first applied to religious devotions in churches in A.D. 658.—BELLARMINE. Organs were used in the Western churches by Pope Vitalianus in 658.—AMMONIUS. It is affirmed that the organ was known in France in the time of Louis I., 815, when one was constructed by an Italian priest. St. Jerome mentions an organ with twelve pairs of bellows, which might have been heard a mile off; and another at Jerusalem which might have been heard on the Mount of Olives. The organ at Haerlem is one of the largest in Europe; it has 60 stops and 8000 pipes. At Seville is one with 100 stops and 5300 pipes. The organ at Amsterdam has a set of pipes that imitate a chorus of human voices.

Orgol. See ARGOL.

Orinoco, one of the principal rivers of South America, ranking in size and importance immediately after the Amazon and Plata, north of which former its basin lies. It rises in the Sierra Nevada, Venezuelan Guiana, winds successively west, north, and east, through the centre of the Venezuelan territory, and enters the Atlantic by numerous mouths, in lat. 8° 40' N., and long. 61° W. Total course estimated at 1600 miles, for more than the latter half of which, or to the rapids of Atures, it is uninterruptedly navigable. Area of its basin, 252,000 square miles. It receives numerous large affluents, principal the Meta and Apure, each having a navigable stream of 500 miles, the Guaviara and Caroni. By the Cassiquiare it has a singular navigable communication with the Rio Negro and Amazon; and in the upper part of its course are several large cataracts and long rapids. At 200 leagues from the ocean, its breadth is about three miles; and at the city of Bolivar, between 250 and 300 miles from its mouths, to which place the tide reaches, it is four miles across, and, when lowest, 65 fathoms deep. About 100 miles from the ocean, it separates into a delta of numerous mouths. It rises gradually from March to September, yearly, usually from 60 to 70 feet, but in one narrow place to 120 feet. Its banks are clothed with dense forests, which, like its waters, abound with animal life. Like all great rivers, its upper waters separate into several branches, and it does not appear that the main source has been ascertained with any degree of certainty. According to La Cruz d'Olmedilla, it issues from a small lake called Ypava, situated in north latitude 5° 5', whence, by a bend of a spiral form, it enters the Lake Parima; but although the existence of this sheet of water has been determined, doubts are entertained whether it may not owe its origin only to the temporary overflowing of the river. From this lake it is said to issue by two mouths; and after a very circuitous route of upward of fifteen hundred miles, including its windings, it flows into the Atlantic Ocean, opposite the island of Trinidad, by about fifty mouths, seven of which are navigable. The Grand Boca, or principal mouth, which is six leagues wide, is southeast of Trinidad, in lat. 8° 30' N., and long. 59° 50' W.

Orpiment (Ger. *Operment*; Fr. *Orpiment*; It. *Orpimento*; Sp. *Oropimente*; Lat. *Auripigmentum*), the name usually given to sulphuret of arsenic. When artificially prepared, it is in the form of a fine yellow-colored powder; but it is found native in many parts of the world, particularly in Bohemia, Turkey, China, and Ava. It is exported from the last two in considerable quantities, and is known in the East by the name of hartal. Native orpiment is composed of thin plates of a lively gold color, intermixed with pieces of a vermilion red, of a shattery foliaceous texture, flexible, soft to the touch like talc, and sparkling when broken. Specific gravity, 3.45. The inferior kinds are of a dead yellow, inclining to green, and want the bright appearance of the best specimens. Its principal use is as a coloring drug among painters, bookbinders, etc.—THOMSON'S *Chemistry*; MILBURN'S *Orient. Comm.*

Orsedew, Orsidue, Manheim or Dutch Gold (Ger. *Flittergold*; Du. *Kluteroud*; Fr. *Oripeau*, *Oliquant*; It. *Orpello*; Sp. *Orope*), an inferior sort of gold leaf, prepared of copper and zinc. It is sometimes called *leaf brass*. It is principally manufactured in Manheim.

Ostrich Feathers. See FEATHERS.

Oswego. Oswego is one of the most thriving cities in the Union. With a population of 20,000, it does as much business as many cities of twice its population. The Welland Canal has given it advantages over even Buffalo, and hence its trade grows enormously. Its increase has been so steady that it will continue to grow with every improvement in the Western States.

The receipts of flour and grain by lake for three seasons are given as follows:

	1854.	1855.	1856.
Flour, barrels.....	167,267	224,643	102,920
GRAIN.			
Wheat, bushels.....	2,412,333	5,565,738	8,282,398

Totals.....	5,492,908	8,959,176	12,632,505
By converting the flour into wheat, at 5 bushels per barrel, the amount would be.....	836,335	1,123,215	514,050
Totals.....	6,429,238	10,092,391	13,146,555

Showing an increase in 1856 of 6,717,717 bushels over 1854, and 3,064,561 bushels over 1855.

The annual review of its commerce for 1856 says, of the grain warehouses of Oswego, "There are ten elevators, which are capable of elevating in the aggregate over 87,000 bushels of grain per hour, and storage room for over two million bushels." This is about the same as Milwaukee. There are in Oswego sixteen mills, with eighty-six run of stone, capable of manufacturing 8600 barrels of flour a day, or over 1,800,000 barrels in a year.

Out of Trim, the state of a ship when she is not properly balanced for the purposes of navigation, which may be occasioned by a defection in the rigging or in the stowage of the hold.

Outtrigger, a strong beam of timber, of which there are several, fixed upon the side of a ship, and projecting from it, in order to secure the masts in the act of careening, by counteracting the strain they suffer from the effort of the careening tackles, which, being applied to the mast-head, draw it downward, so as to act upon the vessel with the power of a lever, whose fulcrum is in her centre of gravity. *Outtrigger* is also a small boom, occasionally used in the top to give additional security to the top-mast.

Owners of Ships. The ownership or title to a ship can be acquired in several ways, as by purchase, building, or capture. In regard to the first, it is generally done by a bill of sale, of which there are two kinds: the first is where the ship passes from the builder to the first purchaser, and is called the grand bill of sale; the second is where the owner of the ship not being the builder, transfers his interest to another purchaser. Upon the death of the owner, his interests devolve upon his executors or his personal representatives. Special conditions may be introduced which may vest the property in the purchaser, although the property may not have been completed, such as a payment of a certain part of the purchase-money, when a part of the vessel has been completed; and he may insist upon the completion of that vessel, and the builder can not require him to accept any other.

er.—ABBOT. A ship's boat does not constitute a part of a vessel's tackle, apparel, furniture, etc.

Property in ships is sometimes acquired by capture. During war ships and private ships having letters of marque, are entitled to make prizes. But before the captors acquire a legal title to such prizes, it is necessary that they should be condemned in the admiralty or other court constituted for that purpose. When this is done, the captors are considered to be in the same situation, with respect to them, as if they had built or purchased them.—See articles PRIVATEERS, LETTERS OF MARQUE, PRIZES, and SHIPS and SHIPPING.

Oyster, a well-known edible shell-fish, belonging to the genus *ostrea*, occurring in most parts of the world. The European oyster (*O. edulis*), which forms a considerable article of trade on the coasts of England and France, is taken by dredging, after which the animals are placed in pits formed for the purpose, furnished with sluices, through which, at spring tides, the water is suffered to flow. In these receptacles they acquire the green tinge so remarkable in the European oyster, and which is considered as adding to their value. This color, which at one time was supposed to be owing to some mineral impregnation, has recently been ascertained to arise from the *confervee*, and other marine vegetable matter, on which the animal feeds. The oysters brought to the different markets in the United States are furnished by several species, which it is extremely difficult to discriminate, and are known among the venders and epicures of this food by appellations derived from the places from whence they are brought. The business of taking these shell-fish employs a great many hands, and no inconsiderable amount of tonnage. In many places oysters are *planted*, as it is called; that is, large artificial beds are formed in favorable situations, where they are permitted to fatten and increase. The breeding-time of oysters is in April or May, from which time to July or August the oysters are said to be *sick* or *in the milk*. This is known by the appearance of a milky substance in the gills. Oysters attain a size fit for the table in about a year and a half, and are in their prime at three years of age; though what the natural term of their lives may be, it is difficult, if not impossible, to determine with any degree of accuracy. Many curious discussions have arisen as to whether oysters possessed the faculty of locomotion. It is well known that, in general, they are firmly attached to stones or to each other; and it has been stated, and generally believed, that they were not endowed with any powers of changing their position. From the observations and experiments of naturalists, however, it appears that they can move from place to place by suddenly closing their shells, and thus ejecting the water contained between them with sufficient force to throw themselves backward, or in a lateral direction. Oysters form the basis of many culinary preparations, but are much more digestible in their raw state than after any mode of cooking them, as this process, in a great measure, deprives them of the nourishing animal jelly, which forms so large a portion of their substance. The shell of the oyster is composed of carbonate of lime and animal matter, and was at one time supposed to possess peculiar medical properties; but analysis has shown that the only advantage of these animal carbonates of lime over those from the mineral kingdom arises from their containing no admixture of any metallic substance. The lime obtained from the calcination of oyster-shells, though exceedingly pure and white, is better suited for work which does not require great tenacity, as for plastering rooms, than for the common purposes of building, as it does not form as hard a compound with sand as the mineral limes.

P.

Pacific Ocean, a vast watery expanse extending from the Arctic to the Antarctic circle, through 127° of lat., and between America on the east, and Asia, the Malay Archipelago, and Australia on the west. In its widest part, at the equator, it is 10,000 miles across; it narrows especially toward the north, where it communicates with the Arctic Ocean by Behring's Strait; and, including the Indian Ocean, it contains upward of 70,000,000 of square miles, or more than all the dry land on the globe. Its coast line on the American side, though generally bold, is very little broken by inlets; on the Asiatic side it is very irregular; and the Celebes, China, and Yellow seas, with the seas of Japan, Okhotsk, and Kamtschatka, are inlets of this ocean. It is studded with a great number of island groups, the principal of which, proceeding from west to east, are the Ladrões, Carolines, Solomon, Queen Charlotte's, New Hebrides, Feejee, Friendly, Society, Low, Marquesas, Sandwich, and Galapagos islands, and New Zealand, besides a vast multitude of solitary islands, reefs, and sand banks. The great equatorial current of this ocean originates in the *Antarctic drift current*, which flows north along the shores of South America, and then west through the Pacific, where it occupies the entire space between the tropics. Strong land currents sweep round the shores of East Australia and Japan. The northeast trade-wind prevails uninterruptedly between lat. 5° and 28° N.; the southeast trade-wind commonly blows from the equator to lat. 26° S.; between them is the region of calms, extending over 5°, and varying in position according to the season. Greatest equatorial temperature of Pacific 88°·5 Fahr. In lat. 56° 26' the temperature of the sea throughout its depth is 39°·5 Fahr. This ocean became first known to Europeans in 1513; it received its name from Magalhaens, who sailed across it in 1521. In the 18th century its different parts were explored by Behring, Anson, Byron, Bougainville, Cook, Vancouver, Broughton, La Perouse, etc. In the present century by D'Entrecasteaux, Krusenstern, Beechey, Fitzroy, D'Urville, Wilkes, and Sir James Ross.

Current of the Pacific.—Lieutenant Bent, of the United States navy, recently read a paper before the Geographical and Statistical Society of New York, of which the following is an abstract, upon "the great ocean current of the Pacific," corresponding with the Gulf Stream of the Atlantic. The Japanese have known it for many years, and call it the Kuro-suro, or Black Stream, from its dark blue color compared with that of the adjacent ocean. The fountain from which this stream springs is the great equatorial current of the Pacific, which in magnitude is in proportion to the vast extent of that ocean, when compared with the Atlantic. Extending from the tropic of Cancer on the north, to Capricorn, in all probability, on the south, it has a width of nearly three thousand miles. With a velocity of from twenty to sixty miles per day, it sweeps to the westward in uninterrupted grandeur around three-eighths of the circumference of the globe, until, diverted by the continent of Asia, and split into innumerable streams by the Polynesian Islands, it spreads the genial influence of its warmth over regions of the earth, some of which, now teeming in prolific abundance, would otherwise be but barren wastes. One of the most remarkable of these off-shoots is the Kuro-Suro, or Japan Stream, which, separated from the parent country by the Bashee Islands and south end of Formosa, where its strength and character are as decidedly marked as those of the Gulf Stream on the coast of Florida. This northwardly course continues to the parallel of 26° N., when it bears off to the northward and eastward, washing the whole southeastern coast of Japan as far as the Straits of Sangar, and increasing in strength as it advances, until reaching the chain of islands to the southward of

the Gulf of Yedo, where its maximum velocity, as shown by our observations, is 80 miles per day. Its average strength from the south end of Formosa to the Straits of Sangar is found to be from 35 to 40 miles per twenty-four hours at all seasons that we traversed it.—*Scientific Annual*, 1857.

The Pacific Trade of the United States.—The whole number of arrivals in the United States from ports in the Pacific during the year 1856 were 69; and in 1855, 146.

Package, Scavage, Baillage, and Portage, were duties charged in the port of London on the goods imported and exported by aliens, or by denizens being the sons of aliens. During the Dark Ages it was usual to lay higher duties upon the goods imported or exported by aliens, whether in British or foreign ships, than were laid on similar goods when imported or exported by natives. But according as sounder and more enlarged principles prevailed, this illiberal dis-

tion was gradually modified, and was at length wholly abolished, in so far at least as it was of a public character, by the act of 24 Geo. III. The duties thus preserved to the city were not very heavy; but the principle on which they were imposed was exceedingly objectionable, and their collection was attended with a great deal of trouble and inconvenience. Not being levied in other places, they operated to the prejudice of the trade of the metropolis. The act 3 and 4 Will. IV. c. 66, authorized the Lords of the Treasury to purchase up the duties in question from the city. This was done at an expense of about £140,000, and the duties were abolished.

Packet, in *Navigation*, meant originally a vessel appointed by government to carry the mails between the mother country and foreign countries or her own dependencies. It is now used as nearly synonymous with an ordinary vessel, chiefly of small burden, that freights goods or passengers.—See NEW YORK, PASSENGERS, and POST-OFFICE.

Pack-horse, a horse employed to carry goods on its back in bundles, called packages or packs. In countries not yet intersected by regular roads this is the only mode of transporting goods from one part to another. In Britain, horses were formerly employed for this purpose, but for these carts and wagons are now substituted. In Spain, mules and asses are still so employed, and in Asia and Africa camels and dromedaries.

Padang. This settlement lies on the west coast of Sumatra, and receives its imports almost exclusively from Java. It has no direct importations from foreign countries. Port, harbor, and other commercial regulations the same as at Java, to the government of which island Padang is subordinate. Under the operation of high tariff duties, especially on American cotton goods, the trade between the United States and Padang is insignificant.

Painter. In *Naval language*, a rope used to fasten a boat either along side of the ship to which it belongs, or to some wharf, quay, etc., as occasion requires.

Paints. The coloring substances or pigments used in the arts. The following are some of the principal pigments and coloring substances included in the commercial name of Paints, and coloring substances:

Asphaltum,	Lead, red and white,
Bronze Powders,	Mineral White,

Palermo (anciently **Panormus**), a large city and sea-port, the capital of the noble island of Sicily, on the north coast of which it is situated, the light-house being in lat. 38° 8' 15" N., long. 13° 21' 56" E. Population, 170,000. The Bay of Palermo is about five miles in depth, the city being situated on its southwest shore. A fine mole, fully a quarter of a mile in length, having a light-house and battery at its extremity, projects in a southerly direction from the arsenal into nine or ten fathoms water, forming a convenient port, capable of containing a great number of vessels. This immense work cost about £1,000,000 sterling in its construction; but the light-house, though a splendid structure, is said to be very ill lighted. There is an inner port, which is reserved for the use of the arsenal. Ships that do not mean to go within the mole may anchor about half a mile from it, in from sixteen to twenty-three fathoms, the mole light bearing N.W. & W. A heavy sea sometimes rolls into the bay, but no danger need be apprehended by ships properly found in anchors and chain cables. In going into the bay, it is necessary to keep clear of the nets of the tunny fishery, for these are so strong and well moored as to be capable of arresting a ship under sail.—SMYTH'S *Sicily*, p. 70, and *Append.* p. 4.

Imports and Exports.—The great articles of export

from Sicily are, olive oil, grain, particularly wheat and barley, silk, brimstone, wine and brandy, barilla, lemons and oranges, lemon juice, manna, shumac, linseed, fruit, salted fish, and salt; with argol, liquorice, pumice-stone, rags, skins, honey, cotton wool, saffron, etc.

ARTICLES EXPORTED FROM AND IMPORTED INTO PALERMO IN 1852.

EXPORTS.

Wheat is largely exported. It is of a mixed quality, hard, and is generally sold from the public magazines, or *caricatori*, by measure, without weight. But the best hard wheat, grown in the neighborhood of Palermo, is sold by the salma of 272 rottoli=476 lbs, English; the difference between weight and measure being made good by the seller or buyer, as the case may be. Wine is principally shipped from Marsala; lemons, oranges, and lemon-juice from Messina; salt from Trapani; and barilla from the southern coast. But all the articles to be found on the coast may, for the most part, be had at Palermo; unless, however, the quantity required be small, it is usually best to ship them from the outports, the expense of their conveyance to Palermo being very heavy. The crops of barilla and shumac come to market in August; but brimstone, salt, oil, wine, rags, etc., may generally be had all the year round. The first shipments of lemons and oranges may be made in the beginning of November.

Purchases of produce are always paid for in cash, generally half on making the purchase, and the other half on delivery, when in Palermo, and on receiving order for delivery, on the coast. The imports consist of cotton yarn, wool, and stuffs; sugar, coffee, cocoa, dye stuffs, iron, earthen-ware, spices, tin, hides, Newfoundland cod, timber for building, etc. The best of the old accounts of the trade of Sicily that we have met with is contained in SWINBURNE's *Travels in the Two Sicilies*, 4to ed., vol. ii. p. 401-413.

Palm (Lat. *palma*, the hand). An ancient measure of length taken from the extent of the hand. There were two different palms; one corresponding to the length of the hand, and the other to the breadth. The Roman palm was about eight and a half English inches. The English palm is understood to be three inches.

Palm Oil (Ger. *Palmöl*; Fr. *Huile de palme*, *Huile de Senegal*; It. *Olío di palma*; Sp. *Acete de palma*) is obtained from the fruit of several species of palms, but especially from that of the *Elais Guineensis*, growing on the west coast of Africa, to the south of Fernando Po, and in Brazil. When imported, the oil is about the consistence of butter, of a yellowish color, and scarcely any particular taste; by long keeping it becomes rancid, loses its color, which fades to a dirty white, and in this state is to be rejected. It is sometimes imitated with hog's lard, colored with turmeric, and scented with Florentine iris root. The inhabitants of the coast of Guinea employ palm oil for the same purposes that we do butter. Our supplies of palm oil are almost wholly derived from the west coast of Africa, of which it is the staple article of export.—LEWIS'S *Materia Medica*; THOMSON'S *Dispensatory*.

Candles are made of palm oil and cocoa-nut oil, of which many thousand tons per annum are now employed. This modern substitution of vegetable fat for animal fat is remarkable. It is bringing Central Africa into intimate commercial relations with civilized countries. The palm oil is liquid in Africa, but it assumes a solid state in a colder climate. The casks containing it have steam forced into them, by which the oil is melted and made to flow out; and the oil is then purified and bleached to various degrees of whiteness, according to the purpose to which it is to be applied. The whitened cakes of palm oil are cut into slices by a machine; the slices are deposited on mats of cocoa-nut fibre; the mats are piled in heaps, with iron plates between them; the heaps are placed in hydraulic presses, where intense pressure brings the palm oil to the state of dry, thin cakes. After a little more purification, the palm oil is fitted for melting, previous to the making of candles.

IMPORTS OF PALM OIL INTO THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1856.

Palms, called by Linnaeus, from their noble and stately appearance, the princes of the vegetable kingdom, are a natural order of arborescent endogens, chiefly inhabiting the tropics, distinguished by their fleshy, colorless, six-parted flowers, inclosed within spathes; their minute embryo, lying in the midst of albumen, and remote from the hilum; and rigid, plaited or pinnated infarticulated leaves, sometimes called fronds. Wine, oil, flax, flour, sugar, and salt, says Humboldt, are the produce of this tribe; to which Von Martius adds thread, utensils, weapons, food, and habitations. The most common species is the cocoa-nut. Their wounded stems, or spathes, yield in abundance a sac-

charine fluid, known in India by the name of toddy. The succulent rind of the date is a most nutritious as well as agreeable fruit. "Sago is yielded by the interior of the trunks of nearly all, except *Areca catechu*, the well-known *pisang*, or betel-nut. The fruit of the latter species is remarkable for its narcotic or intoxicating power." The common canes or ratans of the shops are the flexible stems of species of the genus *Calamus*.

Pampas. The name given to one of the great systems of South American plains, which can scarcely, with propriety, be called *deserts*, inasmuch as they are covered with luxuriant herbage, and inhabited by vast herds of wild cattle and droves of horses. The region of the Pampas forms the basins of the Paraguay and La Plata, and includes the vast plains of Buenos Ayres, extending from the foot of the eastern ridge of the Andes to the "sea-like Plata," and stretching southward into the deserts of Patagonia.—*TRAILL's Physical Geography.* See *Quarterly Review*, xxxv., 114 (ROBERT SOUTHBY).

Pamphlet, a small book, usually printed in the octavo or duodecimo form, and stitched with paper cover, popularly understood to comprise from fifty to two hundred pages.

Panama, a city and sea-port of New Granada, on the Pacific, thirty-eight miles southeast from Chagres, lat. 8° 56' N.; long. 79° 31' 2" W. Population, 7000. It stands on a rocky peninsula, projecting into the Bay of Panama, and has an imposing aspect from the sea. Its streets are well ventilated, and it is said to be cleaner than most Spanish-American cities. It is encircled by irregular and not very strong fortifications, constructed at different periods. The houses are partly of wood, straw, and other fragile materials; but many are substantially built of stone, the larger having court-yards, or *pacios*, in the old Spanish style; and no doubt it has been much improved within the last two or three years. Its roadstead is one of the finest in the world. There are a number of islands a short distance from the main land, which afford secure anchorage for ships of any burden, and from which supplies of provisions, including excellent water, may easily be obtained. The tides daily rise and fall from twenty to twenty-seven feet, so that it is peculiarly well fitted for the repair and building of ships. Previously to 1740, when the trade with the Pacific first began to be carried on round Cape Horn, Panama was the principal entrepôt of trade between Europe and Western America. From that period, however, it fell off; and its decay was peculiarly rapid after the independence of South America, and the opening of the other ports of the Pacific. But since the occupation of California by the Americans, and especially since the discovery of the auriferous deposits in that country, it has again rapidly increased. And now that a railway is carried across the isthmus, it will in all probability attain to greater commercial distinction than ever. In the course of the year 1855 as many as twelve steamers were employed in the trade between Panama and San Francisco.

There is a treaty of commerce between the United States and New Granada, the terms of which are complied with by New Granada, but are sometimes broken by the local government of the province, which placed a tax upon passenger-carrying vessels, at the rate of one dollar for each passenger, which has been recently annulled by the supreme government of New Granada. The commercial intercourse of the United States is alone dependent on the regulations made by the general government of New Granada, which latter, by an act of Congress, has made Panama and other ports on the isthmus free ports of entry since the 1st of January, 1850. There are no privileges permitted to the commerce of other nations which are denied to the United States, and there are no restrictions imposed on the commerce of other nations other than what are

imposed upon that of the United States. The sum of \$6 40 is collected from each American vessel; viz., \$4 80 to the captain of the port, and \$1 60 to the interpreter. The same charge is made against New Granadian vessels, except the interpreter's fee. The transshipment of goods from one port to another in New Granada, or to a foreign country, by United States ships, is permitted without restrictions. The currency of this country, by a recent law, is established at ten dimes to the dollar. The weights and measures are the same as used in France, but as yet are not brought into use in this country. The French silver, by a law of New Granada, is made a legal tender at the rate of twenty cents to the one-franc piece, although, compared with the value of United States silver, it would only be worth 18-6 cents. New Granada does not export anything from here other than a very few hides, and the imports of the United States to this place consist only of coal and provisions for the steamers which carry passengers to and from the isthmus. The laborer in this consular jurisdiction receives from two to three dollars per day; mechanics from six to eight dollars per day; and clerks from \$1500 to \$2000 per annum. There are no price-current sheets published in this consular jurisdiction.—*Commercial Relations of the United States.*

Panama, or Darien (Isthmus of), connects North (or rather Central) and South America, and is comprised in the republic of New Granada, sec., Isthmus, forming a province between lat. 9° and 10° N., and long. 77° 30' and 81° W., having north the Caribbean Sea and Gulf of Darien, and south the Gulf of Panama. Length, west to east, about 200 miles, average breadth 40 miles, but in long. 79° it is narrowed to less than 30 miles. Surface undulating, the hill chains which extend through the isthmus, uniting the mountain systems of Central and South America, are, near Panama, not more than 260 feet above the level of the Pacific. A great quantity of rain falls; in the months of July, August, and September it rains incessantly. Soil very fertile; products comprise fine timber, in great variety, fruits, rice, maize, sugar-cane, coffee, cocoa, caoutchouc, vanilla, dyes, drugs, hides, limestone. On its north coast are Aspinwall (colony), Puerto-Bello, and Chagres; on its south side is Panama. A connection between the Atlantic and Pacific oceans has been proposed at different points of Central America; viz., at Tehuantepec, at Chiquimula, at Nicaragua, and at the narrowest part, where a railroad has been constructed between Aspinwall and Panama.

Passage across the Isthmus of Panama or Darien.—Latterly, or since the discovery of the mineral riches of California, the isthmus has become a great thoroughfare, vast numbers of individuals having crossed from the port of Chagres on the Caribbean Sea to Panama on the Pacific Ocean, and conversely. The port of Chagres is within the mouth of the river of that name, in lat. 9° 18' 6" N., long. 79° 59' 2" W. A bar at the mouth of the river has only from 10 feet to 12 feet water, though within the bar the river deepens to from four to six fathoms. It is probable that the bar might be deepened without much difficulty, and a canal might be cut from the bottom of the Bay of Manzanilla to the river, from which it is only three miles distant. A short while ago the town (if so it might be called) was a mere cluster of huts, unhealthy, and without any accommodation for passengers. But having latterly become one of the starting-points in the nearest and shortest route from the east to California, it has been considerably improved. A joint-stock company was formed in New York for the construction of a railway from or near Chagres, at the bottom of Manzanilla Bay, to Panama, a distance of about 34 or 35 miles. This railway has been completed, and is now in operation. The undertaking reflects great credit on American enterprise and perseverance. The difficulties to be overcome were of a very formidable description, partly from

the nature of the ground, which not unfrequently consisted of deep marshes, but more from the luxuriance and strength of the vegetation through which it was necessary to penetrate, and the heat, moisture, and unhealthiness of the climate. Unluckily, the desire to accomplish their task in the shortest time and at the least expense, tempted the engineers to execute the work in a very superficial manner, substituting bridges, viaducts, pillars, etc., of wood for those of stone, mortar, and iron. In a country where the decomposition of vegetable matter is so very rapid this was as false and spurious a species of economy as can well be imagined. Already several miles of the railway have had to be repaired, or rather reconstructed, by the substitution of *lignum vitae* and other hard woods for the softer ones that were first used. This, however, will do little more than palliate the evil; and there can be no doubt that eventually stone and iron bridges and viaducts will have to be used instead of wooden ones every where along the line. Trains take about four hours in passing from sea to sea; but were the railway properly finished, the passage might be performed in less than half that time. A station, called Aspinwall, has been erected on Manzanilla Island, in the Caribbean Sea. But it is extremely unhealthy, and there is little prospect of its ever becoming a place of much importance. —TOMES's *Panama Railroad*, New York, 1855, *passim*.

But supposing (which is not the case) that this railway were every thing that could be desired, still it is plain that the grand desideratum is the carrying across the isthmus of a water communication between the Atlantic and Pacific oceans. We do not mean by this a canal suitable only for coasters, or vessels of comparatively small burden. Such a channel would be of little use, except to the countries contiguous to its termini. What is really wanted is a canal that will admit ships of the largest burden, and bound on the longest voyages. The advantages that would result from having the isthmus perforated by such a channel can not be easily exaggerated. No other project that appears to be within the limits of possibility, perhaps not even the carrying of a ship canal across the Isthmus of Suez, would give so great a stimulus to commerce and navigation. It would remove the barrier which renders the navigation between the eastern and western coasts of America so tedious and difficult. And, by doing this, it would enable ships from Europe to reach the latter and the Pacific in less than half the time they do at present, while it would greatly facilitate the voyage to Australia and China.

And a grand project of this sort is on foot. It is proposed to cut a canal that shall admit ships of 1000 tons burden and upward, between Porto Escoces (lat. 8° 5' N., long. 77° 21' W.), near Point Caledonia, in the Gulf of Darien, on the Caribbean Sea, and the Rio Savana, which falls into the Gulf of San Miguel, on the Pacific. The intervening space (about 38 or 40 miles) is said to be comparatively flat; the ports at each extremity are easy of access, and have deep water; and it is proposed that the canal should be constructed throughout on the same level, and have no locks. The cost of the project is estimated at from 12 to 15 millions sterling. And considering the vast importance of such a work to the United States, to England, and, indeed, to all maritime nations, this expense, heavy as it may appear, should be reckoned a subordinate matter. Were the country through which it is to pass in the possession of England or the United States, it would most probably have been undertaken. But the unsettled state of Central America, and the knotty questions that might eventually arise as to the property and management of the canal, are serious obstacles to its being proceeded with.—See, for ample details on this interesting subject, the work of Dr. CULLEN, entitled *Isthmus of Darien Ship Canal*.

The route by which the railroad passes is in every respect the most desirable for this purpose, and the

means by which the character of the country could be best known, as far as its topography and the features essential to the object in view could be seen. It was, in fact, the direct means for the accomplishment of the purpose. It is supposed that the canal will be united with the waters of the Pacific on either side of the city, and that a channel might be dredged to the depth of thirty feet, to meet the navigable waters for ships of large draught. The bay then expands into an ample harbor, where the winds are said never to blow with violence, sufficiently comprehensive for the commerce of the world, and studded with islands, convenient for all the great purposes that the condition of things would call for, by the construction of a canal through the isthmus.

The Isthmus itself seems to present no serious obstacle to science for the construction of a canal. The whole extent, from the Atlantic to the Pacific, is made up of swamps, hills, and plains; and the highest point of land where the railroad passes is not more than 286 feet above the level of the sea. On the whole route, most if not all the hills through which the canal would pass would be required for embankments over the plains and swamps; and there are no insuperable obstacles to piercing the highest part, so as conveniently to make the waters of the Chagres, Obispo, and Rio Grande available for the wants of a canal. In a climate less unfavorable to the white man, the question of "feasibility" would not be raised. It seems to be conceded, from experience, that the African race alone persistently labor in this climate. A few thousand of free blacks might be obtained from the West India Islands; but this resource would be inadequate, as was experienced by the operations on the Panama Road. The want of men to labor would seem to be the great obstacle to the successful accomplishment of a work of so much magnitude.

On the Atlantic side the canal would enter the Bay of Aspinwall. In approaching this point, it would pass a few miles from the Chagres, and enter the bay near the River Mindi. Here, it will be seen, as in the Bay of Panama, extensive dredging for a channel to meet the deep water would be necessary. The bay expands for the distance of about five miles, between two headlands, and is open to the sea. A breakwater would be necessary here. With such an one as would afford the necessary protection against the ocean swell, the Bay of Aspinwall, like the Bay of Panama, would afford ample room for the commerce of Europe as well as America; and in contemplating these two bays with the eye of a seaman, and in reference to the great work in question, it would look as though nature had provided them for the especial convenience of man in his laborious undertakings in the extension of commerce, and a place where all nations may meet, in their varied pursuits on the great highway of the ocean. In a work like that of a canal through the Isthmus of Darien, it is to be supposed that the requirements of commerce and navigation, in its most extended application, would alone be considered; and, taking this for a standard, a canal two hundred feet wide and thirty feet deep would seem to be the appropriate dimensions. With such an avenue from the Atlantic, the stormy and distant seas of the South would be abandoned by Europe as well as America, and we should meet there on neutral ground, pursuing with a common purpose the paths of peace and industry, which by its means, we may suppose, would effect a moral revolution such as the world has never known, and surpassing in importance that which would be effected in the revolution of the commercial world.

Appended is a paper submitted by Colonel G. M. Totten, containing dimensions and other data for the proposed ship-canal across the Isthmus of Panama:

Dimensions and other Data of the proposed Ship-Canal across the Isthmus of Panama.—Length from shore to shore, 45½ miles. Length from five fathoms water

in Navy Bay, on the Atlantic, to three fathoms water in Panama Bay, on the Pacific, 48½ miles. The prism of water to be 150 feet wide at the bottom, 270 feet wide at surface, and 31 feet deep. The locks to be 400 feet in clear length of chamber, and 90 feet in clear width. The summit level will be 150 feet above mean tide of the Atlantic and Pacific oceans. The summit cut will be about four miles long. The deepest cutting on this level will be 136 feet, and the average depth of the cut will be 49 feet. The River Chagres yields an ample supply of water for the canal at all seasons of the year. The summit level will be supplied by a feeder about twenty-four miles long, which will tap the River Chagres about twenty-one miles above the town of Cruces, where the level of the river is about one hundred and eighty-five feet above mean tide, and about thirty-five feet above the summit level. The cost of this canal, including the requisite harbor improvements at each end, will not exceed \$80,000,000. —COMMODORE PAULDING'S *Report to the Navy Department*, United States, 1857.

The following figures will show the comparative distances from New York to San Francisco of the four routes, exclusive of the land travel:

Routes.	Distance on Atlantic.	Distance on Pacific.	Total.
	Miles.	Miles.	Miles.
Panama.....	2392	3755	6147
Nicaragua.....	2403	2964	5367
Honduras.....	2102	2865	4967
Tehuantepec.....	2276	2305	4581

The several transit distances, and the total distances from New York to San Francisco, are shown by the following table:

Routes.	Transit Distances.	Total Distances.
	Miles.	Miles.
Panama.....	51	6198
Nicaragua.....	137	5504
Honduras.....	161	5123
Tehuantepec.....	236	4817

Papal States. This portion of Italy comprises an area of 17,210 square miles, and contained in 1850 a population of 3,066,771 inhabitants. The chief productions of the Papal States are wheat, maize, pulse, hemp, wine, oil, and tobacco. There are numerous mines of iron, lead, sulphur, alum, vitriol, and other volcanic products; but, with the exception of the sulphur mines near Rimini, they are unproductive. The quantity of this article annually manufactured amounts to about 84,000,000 pounds. The manufactures of the Papal States comprise silks, leather, gloves, paper, musical strings, iron and glass ware, a few cotton goods (at Rome), crape and sausages (at Bologna), and cordage, soap, cream of tartar, and glue. There is no direct trade between the United States and the Papal States—the latter deriving their supplies of cotton, sugar, coffee, cocoa, rum, etc., from the ports of Genoa and Trieste. The foreign commerce of these states is conducted chiefly through the ports of Ancona and Civita Vecchia—the former with the western shores of the Adriatic, and the latter with the Mediterranean ports. The celebrated Roman cement is exported from the port of Civita Vecchia.

Foreign Trade.—In 1850, the foreign trade of Ancona represented \$4,464,000, viz., imports, \$2,976,000; exports, \$1,488,000. This trade was distributed between Austria, England, and its dependencies in Europe, these countries appropriating more than three-fourths of the whole. During the same year the foreign trade of Civita Vecchia amounted to \$3,821,928; viz., imports, \$2,929,314; exports, \$892,614. The countries participating in this trade were France, Sardinia, England, Holland, and the Two Sicilies. The whole foreign commerce of the Papal States in 1850 amounted to \$19,208,680; and in 1851 to \$20,454,240. All foreign vessels are permitted to engage in the coasting trade of the States on the payment of the fol-

lowing dues: Anchorage, on French, Austrian, and American vessels, three bajocchi per ton—about three cents. Foreign vessels putting into harbor, either for anchorage or through stress of weather, pay half of the above-named duty.—See ITALY.

Clearance Duty.—For each vessel of from 1 to 149 tons, ten bajocchi (ten cents); and for 150 tons and upward, twenty bajocchi (twenty cents). No vessels enjoy an exemption from the custom-house duties on imports and exports. These duties have recently undergone several reductions, applicable chiefly to articles of necessity; on articles of luxury, in which sugar is included, the duties have been proportionably raised. —*Commercial Relations of the United States.*

Paper (Ger. and Du. *Papier*; Fr. *Papier*; It. *Carta*; Sp. *Papel*; Russ. *Bumaga*; Lat. *Charta*; Arab. *Kartas*; Pers. *Kaghaz*). This highly useful substance is, as every one knows, thin, flexible, of different colors, but most commonly white, being used for writing and printing upon, and for various other purposes. It is manufactured of vegetable matter reduced to a sort of pulp. The term paper is derived from the Greek word *παπύρος*, *popyrus*, the name of the plant on the inner bark of which (*Liber*, βίβλος, whence our word *book*) the ancients used to write. Paper is made up into sheets, quires, and reams, each quire consisting of twenty-four sheets, and each ream of twenty quires.

Historical Sketch of Paper. *Difference between ancient and modern Paper.*—Some of those learned and ingenious persons who have investigated the arts of the ancient world have expressed their surprise that the Greeks and Romans, though they possessed an immense number of books, and approached very near to printing in the stamping of words and letters, and similar devices, should not have discovered the art; the first rude attempts at typography being sufficiently obvious, though much time and contrivance have been required to bring the process to its present state of perfection. But they should rather, perhaps, have wondered that the more civilized nations of antiquity did not invent paper, an invention which, it may easily be shown, necessarily preceded that of printing. But this was an exceedingly difficult task; the more so, that the vast importance of paper could not be appreciated, or even imagined, till after it had been generally introduced. At first, the memory of important events appears to have been handed down by inscriptions cut on rocks, pillars of stone or marble, and the walls of edifices; and this primitive usage is still retained in the monuments in our churches and cemeteries. In a later, though still very remote age, men were accustomed to write upon portable surfaces of various kinds. Every body knows that the Decalogue was written upon tables of stone; and Joshua wrote a copy of the law upon the like materials.—*Josh. c. viii., v. 32.* The Greeks and Romans engraved laws, treaties, contracts, and other important documents, on plates of brass; and it is stated that a fire which broke out in the capitol, in the reign of Vespasian, consumed above 3000 such bronze muniments.—*Nouveau Traité de Diplomatique, i. 451.* But exclusive of plates of this sort, which were necessarily inconvenient, costly, and quite unfit for ordinary use, thin and flexible plates of lead and other metals (*Job, c. xix., v. 23, 24*), thin pieces of wood, skins, parchment, linen, and a variety of similar substances, were used in writing. Cheaper materials, such as the leaves and bark of trees, palms, etc., were also used from a very remote period for the same purpose; but leaves (*χάρται, chartæ*) being, when dry, apt to split in the direction of the fibres, it was found to be necessary, in preparing them for writing, to glue them together, so that the fibres might cross each other in opposite directions. The texture of the leaf, or sheet, if we may so call it, is thus greatly strengthened; and when it has been smoothed, polished, and fitted for use, it is less inconvenient and better looking than might be supposed. Such, in

fact, is the principle on which the paper of the ancients was formed. This, however, which was called *Charta Egyptiaca*, from the place of its manufacture, did not consist of leaves, but of the inner bark of the famous reed or rush, the *Cyperus Papyrus*, found along the banks of the Nile, or rather in the pools and ditches which communicate with the river. The ancients applied this useful plant to an immense variety of purposes; but here we shall only notice that from which it has acquired an immortality of renown. The inner bark having been divided by a needle or other sharp instrument into very thin and broad layers or filaments, portions of these were placed side by side longitudinally, and glued together at the ends; another portion being glued cross-wise on the backs of the latter, to give the page the requisite strength. Pliny and other writers have described the process (*Hist. Nat. lib. xiii. c. 11, 12, 13*), which has been further elucidated by Hardouin and other commentators. But the fullest and ablest discussion of this curious subject is contained in the very learned and elaborate work, the *Nouveau Traité de Diplomatique* (i. p. 448-524), where the most interesting particulars respecting the history and manufacture of papyrus, as well as of the greater number of the other writing materials used in antiquity, have been collected and set in the clearest point of view.—See also the *Dictionnaire Diplomatique* of De Vaines, art. PAPIER, ii. 165-174. Bruce has given a summary of the authorities in the seventh volume of the octavo edition of his *Travels*; and, not satisfied with this, he attempted to make paper from the papyrus, in which, not being very successful, he imputes his failure to errors in the statements of Pliny; not reflecting that, had he endeavored, trusting to written directions, without experience and traditional art, to make modern paper, or even a pair of shoes, he would most probably have been equally unsuccessful. Egypt enjoyed for a lengthened period a natural monopoly of this valuable article, and even attempted, in anticipation of a later policy, by prohibiting the growth of the papyrus, except in certain localities, and limiting its supply, to sell its produce at an artificially enhanced price!—AMELION, *Commerce des Egyptiens*, p. 238. But this policy ceased on the conquest of Egypt by the Romans, who, having imported the plant into Rome, succeeded in preparing from it a very superior article. Pliny enumerates the various kinds of paper, from the coarsest, which was used, like our brown paper, for packing, to the most expensive and finest. The latter, which was made of the innermost filaments, was of a snowy whiteness; and when properly dressed and polished, was easily written upon. The consumption was very considerable; and being, after the foundation of Alexandria, principally made in that city, it formed an important article in her commerce, and furnished employment for many workmen and much capital. Flavius Vopiscus relates that, in the third century, the tyrant Firmus used to say there was so much paper there, and so large a quantity of the glue or size used in its preparation, that he could maintain an army with it: "*Tantum habuisse de chartis, ut publicæ sæpe diceret, exercitum se alere posse papyrò et glutinò.*" We may doubt whether the value of the paper at present belonging to any single city would do the like. *Charta Egyptiaca* is very ancient, having, notwithstanding the assertion of Varro and Pliny to the contrary (*Hist. Nat. lib. xiii. cap. 11*), been in common use long before the age of Alexander. This is evident from the statement of Herodotus, who, though he lived about a century before that conqueror, tells us that in former times, when papyrus was scarce, the Ionians wrote on the skins of goats and sheep, and that that practice continued to be customary among several barbarous nations.—Lib. v. cap. 58.

Though white, smooth, durable, and not ill adapted for writing, ancient paper was not suited for the printer; by reason of the closeness of the grain, it would

not have received the ink from types more kindly than shavings of wood, and such like materials; and its texture was so very brittle that it would have shivered to pieces under the press. It was, in truth, an inartificial mass ("*viscera nivea virulentum herbarum*"), no great invention or ingenuity being discovered in its preparation. Modern paper, on the other hand, is wholly artificial; and the contrivances for its manufacture are marvelous alike for the sagacity evinced in their design and their practical efficiency. Like the paper of antiquity, it is formed of the filaments of various sorts of vegetable substances, derived principally from the tearing to pieces or pounding cotton and linen rags, and similar materials, mixed with water. This process is called beating them into pulp; and when examined with a microscope, the floating filaments are found to be well fitted for adhering together, being jagged and rough, and mixed in every possible way. A portion of this mixture or pulp being, when properly prepared, poured upon moulds or sieves of fine woven wire, the water is drained off, and the suspended fibres falling to the bottom, form a layer or sheet, which, being consolidated by pressure and dried, becomes paper, its strength and goodness depending, of course, in a great measure, on the quality of the rag or other material of which it is made. Paper used to be manufactured by dipping sieves or frames into the pulp, the portion of filaments so lifted up forming the sheet of paper. But the application of rotary motion to the manufacture has effected a total change in the mode in which it was carried on: instead of dipping the sieves or frames into the cistern of pulp, a circular web, or round towel of woven wire, revolves horizontally under the vessel (technically called the vat), receives the deposit, conveys it away, and, by an adjustment of extraordinary delicacy, transfers it uninjured, though as fragile as a wet cobweb, to a similar revolving towel of felt; thus an endless web of paper is spun, as long, at least, as the machine continues to move and pulp is supplied.

The pervious and spongy texture of paper make it readily imbibe and retain the ink impressed on it by types in printing, and by the pen in writing; its toughness hinders it from being easily torn; and, in a well-bound book, under favorable circumstances, its duration is indefinite, and, for all practical purposes, eternal! It is true that legal documents are sometimes written or printed on parchment, which is less liable to be torn or injured by rubbing; the luxury of typography occasionally, also, exhibits a few impressions of a splendid work upon vellum; and it is further true that these substances were used for writing upon by the ancients; but they are necessarily expensive, and the cost of either far exceeds the means of the great majority of book buyers—so that it would be altogether unprofitable to cast types, to construct presses, and to incur the various and heavy charges of an establishment for printing, unless we possessed a cheaper material on which to print. Almost all the more ancient and valuable existing Greek and Latin manuscripts are written either on parchment or vellum, but generally on the latter. It is singular, however, that while such is the case, all or almost all the very old charters and diplomas are written on papyrus. Indeed, the learned authors of the *Nouveau Traité de Diplomatique* affirm that no parchment charter has been discovered anterior to the sixth century.

It appears to be sufficiently established that paper, fabricated like that now in use, of cotton and other vegetable materials, and of silk, has been manufactured in China from a very remote epoch.—*Nouveau Traité de Diplomatique*. The Arab historians state that similar paper was manufactured in Mecca in the beginning of the eighth century (ANDRES, *Origine e Progressi d' Ogni Letteratura*, and GIBBON, ix. 379); and most probably the mode of its production was then also known to the Greeks. It appears to have been

soon after introduced into Europe, but it is doubtful whether this were done by the Arabians or Greeks. The mode of fabricating paper from cotton and other vegetable materials being once discovered, its fabrication from linen rags was a comparatively easy, and in Europe, where cotton was then extremely scarce, an all but necessary step. It is singular, however, that we have no positive information either as to the country where, or the epoch when, paper from rags began to be manufactured in Europe. *Mais on ne peut reculer son invention plus tard, qu'au Treizieme siecle, ni son usage ordinaire au-delà du Quatorzieme. — Nouveau Traité, etc., i. 524.* In fact, Egyptian paper, or paper made of papyrus in the manner described above, continued to be partially employed down to the middle of the eleventh century, though parchment was then the principal material used in writing. It is curious to observe how, very shortly the introduction of paper preceded the invention of printing, to which, indeed, as already seen, it was an indispensable preliminary. Muratori attributes the ignorance of the barbarous ages principally to the scarcity and high price of paper, and the superior intelligence of modern times to its abundance and cheapness. — ANDRES, i. 200. And whatever opinion may be entertained as to the first part of this statement, there can be no question that the latter is perfectly well founded.

Not only are we in the dark as to the history of modern paper, but we are unable to make any very satisfactory conjectural estimate of the mode in which it was invented. It is all but certain that the invention must have been suggested by accident, or by observing the effects produced by the accidental drying of triturated vegetable matter, or in some such way; and that the hint thus afforded was gradually improved upon. It is not possible to imagine that the invention should have been wholly the result of design; for we can not conceive how any one without any previous knowledge should have proposed to himself to produce paper by pounding rags, or other vegetable matter, mixing the mass in water, and then pressing and drying the deposit. But, without indulging in unprofitable conjectures, it is at all events certain that, however and by whomsoever discovered, no invention has been of greater importance. *Charte usu maxime humanitas vite constat et memoria.* — PLINY, *Hist. Nat. lib. xiii. cap. 11.* The processes by which the most worthless and vilest materials are converted into such admirable substances as paper and glass are probably the greatest triumphs of human talent and ingenuity. They have more than realized the dreams of the alchemists, and have been incomparably more advantageous than if we had become acquainted with a means of transmuting the inferior metals into gold.

In 1813, Dr. Colquhoun estimated the value of paper annually produced in Great Britain at £2,000,000; but Mr. Stevenson, an incomparably better authority upon such subjects, estimated it at only half this sum. From information obtained from those engaged in the trade, we incline to think that the total annual value of the paper manufactured in the United Kingdom, exclusive of the duty, may at present amount to about £1,600,000 or £1,700,000. There are about 700 paper-mills in England, and from 70 to 80 in Scotland. The number in Ireland is but inconsiderable. Of these mills, we believe, very few have lately been unemployed. It was formerly customary to collect the rags used in the manufacture into large heaps, in order that, by their heating and fermentation, they might be the more easily reduced to filaments. But this injured the rags; and it is now the practice to tear them to pieces, without any such preparation, by powerful machines constructed for the purpose. During the present century this manufacture has been signally promoted by the combined influence of science, ingenuity, and mechanical skill. These have been successfully exerted in the preparation of the pulp; the conversion of the pulp

into paper, and the provision of materials; and in none has their influence been more remarkable than in the last. This is evident from the fact that, while the manufacture has been more than doubled since 1820, the demand for Continental rags and other foreign materials has actually been reduced within that time, in consequence of the immense home supply we derive from substances previously regarded as worthless, and treated as refuse. The sweepings of cotton and flax mills, owing to the grease and dirt with which they are mixed up, were, until within these few years, of no value whatever, except as manure. The chemical and mechanical processes by which these materials are purified, whitened, and made available for the production of paper, without their strength being impaired, are not only exceedingly interesting in themselves, but are of great national importance; and, by reducing the cost of paper, have done ten times more to lower the price of books, and diffuse literature, than all the efforts of all the societies that ever existed.

The first idea of a machine for converting pulp into paper originated in France, the inventor being an ingenious workman of the name of Louis Robert. A model of this machine was brought to England by M. Leger Didot; and though at first it was far from giving an assurance of success, it sufficed to induce English capitalists and engineers, particularly Mr. Donkin, to follow up the scheme; and in the course of a few years they brought it to a high degree of perfection.

The following tabular statement exhibits the aggregate quantities, values, and prices per pound of rags imported into the United States from all countries, distinguishing in a separate column the quantities received from Italy during a period of ten consecutive years, from 1846 to 1855:

Years.	Rags imported from all Countries	Rags imported from Italy.	Aggregate Values	Price per Pound.
	Pounds	Pounds	Dollars.	Cents.
1846.....	9,837,706	8,002,865	385 020	3 89
1847.....	8,164 886	6,529,234	304 177	3 73
1848.....	17,014,587	13,808,036	626 136	3 68
1849.....	14,941,236	11,009,608	524 437	2 51
1850.....	20,696,875	15,861,266	747 137	3 61
1851.....	26,094,701	18,512,673	902 876	3 46
1852.....	18,288,458	12,220,579	622 876	3 42
1853.....	22,766,000	14,171,202	985 465	3 31
1854.....	32,015,753	24,240,999	1,007 826	3 39
1855.....	40,013,516	23,948,612	1,224 413	3 06
Aggregate.....	209,888,716	148,300,155	\$7,328,721	
Ann. average .	20,988,371	14,830,015	732 872	

From the preceding table it will be seen that during the decennial period ending with 1855 the aggregate quantity of rags imported into the United States from all parts was 206,631,954 lbs., while the aggregate quantity received from Italy reached as high as 148,300,155 lbs. The annual average for the period designated will, however, furnish a more statistical basis for ascertaining the relative importance of Italy compared with all other countries as the principal source of supply upon which the United States must rely, with any degree of certainty, for an article the consumption of which is so rapidly increasing there; even during the past year, an alarming deficiency of the manufactured material was seriously apprehended by the conductors of our periodical and newspaper journals. The average annual quantity imported into the United States from all countries during the period designated was 20,988,371 lbs.; the average annual quantity received from Italy was 14,830,015 lbs. Thus it is shown that instead of one-fifth Italy actually furnishes nearly two-thirds of all the rags imported into the United States.—See RAGS.

The consumption of paper in the United States is equal to that of France and England combined. In other words, the 28,000,000 inhabitants of the United States consume as much paper as the 64,000,000 inhabitants of France and England. This is very near-

ly correct. The statistics, however, will prove interesting. The number of paper-mills in operation in England in 1835 was 750, and the annual value of the paper manufactured reached as high as \$6,000,000. At that period, however, the manufacture of paper was burdened with an excise duty amounting to more than three times as much as the total wages of the hands employed in making it, and the quantity annually produced did not exceed 50,000,000 lbs. of first-class and 16,000,000 lbs. of second-class paper, requiring a supply of about 100,000,000 lbs. of rags.

Improvements in machinery and mode of manufacture, and the application of steam, have reduced the number of mills in Great Britain and Ireland to 380, according to the latest statistical returns; while the quantity of rags annually consumed has risen to 201,600,000 lbs., or over 100 per cent. We have compiled from a recent, though in this country a rare Dublin publication on statistics, the following tabular statement, showing the quantity of paper manufactured, consumed, and exported in Great Britain for a period of nine years, ending with 1854:

COMPARATIVE STATEMENT SHOWING THE QUANTITIES OF PAPER MANUFACTURED, CONSUMED, AND EXPORTED IN GREAT BRITAIN FROM 1846 TO 1854.

Years.	Pounds of Paper manufactured in Great Britain.	Pounds of Paper retained for Consumption in Great Britain.	Pounds of Paper exported from Great Britain.
1846	127,400,000	122,600,000	4,836,000
1847	121,900,000	116,100,000	5,852,000
1848	121,800,000	116,600,000	5,180,000
1849	132,100,000	126,100,000	5,966,000
1850	141,000,000	133,200,000	7,762,000
1851	160,900,000	142,500,000	8,305,000
1852	154,490,000	147,100,000	7,328,000
1853	177,600,000	164,900,000	13,296,000
1854	177,800,000	161,700,000	16,112,000

France turns into paper annually about 235,200,000 lbs. of rags, producing about 156,800,000 lbs. of paper. In the United States there are 750 paper-mills, which work up each year about 405,000,000 lbs. of rags. Assuming (the usual estimate) that $1\frac{1}{2}$ lb. of rags yields 1 lb. of paper, we have the following comparative statement for the United States, and France and Great Britain combined:

	Pounds of Rags annually consumed.	Pounds of Paper annually manufactured.	Pounds of Paper per Capita.
United States.....	405,000,000	270,000,000	10.30
Great Britain and France combined)	436,900,000	291,200,000	4.55

From this statement it appears that the United States consumes 31,800,000 lbs. of rags, and manufactures 21,200,000 lbs. of paper, less than Great Britain and France combined, while the quantity of paper manufactured *per capita* of the population of the former is more than double that assigned to the combined population of the two latter. The quantity of paper imported in Great Britain and France and added to

the stock for consumption might vary slightly, but not materially, the above results. The preceding statement, however, omits the quantities annually imported and exported by each of the countries respectively, items without which no calculation as to consumption can be accurately made. The importation of paper of all kinds into France in 1853 did not exceed 337,104 lbs., while the exports amounted to 17,053,657 lbs. This gives an excess of exports over imports to be supplied from the stock of domestic manufacture, of 16,716,553 lbs. Deduct this from 156,800,000 lbs., the quantity manufactured, and we have left for consumption 140,083,447 lbs., or 3.89 lbs. *per capita* of the population.

During the same year there were imported into England, according to the Report on Trade and Navigation, 909,250 lbs. of paper. The report gives this quantity for the last six months of the year only; assuming that the importation during the first six months was equal to that for the last as above given, and the total importation would reach, say 200,000 lbs. The quantity exported, we have seen, was 13,296,874 lbs., leaving an excess of exports over imports of 13,696,874 lbs. Recent and important improvements have been made, by the use of refuse tanned leather, bark of the cotton-stalk, pulp from the fibres of endogenous plants, as raw materials for the manufacture of paper.—*Scientific Ann.*

EXPORTS OF PAPER AND STATIONERY OF DOMESTIC MANUFACTURE FROM THE UNITED STATES FOR THE YEAR ENDING JUNE 30, 1856.

Paper Boxes.—The manufacture of boxes from paper, or rather pasteboard, has become a very large one, from the custom of so many manufacturers selling their goods in these boxes. It is said that in Paris four thousand persons are employed in this trade alone. The trade is divided into six branches. The first comprises the most elaborately-finished and ornamented boxes, for the display of artificial flowers, rich velvets, ribbons, silks, trimmings, medals, miniatures, and corbeilles for wedding presents. The second class consists of boxes and small ornaments for confectioners. The third kind are used for packing toys and trinkets of small size. The fourth kind are for perfumery, fans, gloves, etc. The fifth comprises large boxes for shawls and ribbons for exportation. The sixth are pill-boxes, wafer-boxes, and others of the smallest kind. The French productions in this department of manufactures are superior to any other in neatness of execution and taste of ornamentation.

Chinese Paper.—The Chinese make a filamentous kind of paper much superior to ancient papyrus; it obtains in England the name of rice-paper; but sufficient is now known of it to show that this is by no means a correct designation. Dr. Livingstone introduced Chinese rice-paper in England about half a century ago; it had great favor as a material for artificial flowers. It was many years afterward that information was obtained concerning the mode adopted by the Chinese in making these small but very expensive sheets of paper. There is a leguminous plant growing in China and India, the stem of which is cut into pieces eight or ten inches in length; and these are cut by the Chinese into one continuous spiral film, on the same principle as the modern mode of veneer cutting, but by the dexterous use of hand-tools. These laminae, spread out and pressed flat, form thin sheets, which, after being dyed and otherwise prepared, constitute the rice-paper of the Chinese.

The same ingenious people make paper of bamboo. The bamboo stems, when about three or four inches thick, are cut into pieces four or five inches long. These, when softened in water, are washed, cut into filaments, dried and bleached in the sun, boiled, beaten to a pulp, and made into thin sheets of paper. This is truly paper, which the former examples are not; and the art must have made a considerable advance before such a method could have suggested itself.

Paper-hangings.—Stamped paper for this purpose was first made in Spain and Holland about A.D. 1555. Made of velvet and floss for hanging apartments, about 1620. The manufacture of this kind of paper rapidly improved in Great Britain from early in the eighteenth century; and it has now been brought to great perfection. Since this important and elegant substitute for the ancient "hangings" of tapestry or cloth came into use about 200 years ago, the manufacture has undergone a gradual succession of improvements, and has now reached a high state of beauty and perfection. The patterns on these papers are sometimes produced by stencil plates, but more commonly by blocks, each color being laid on by a separate block cut in wood or metal upon a plain or tinted ground. The patterns are sometimes printed in varnish or size, and gilt or copper leaf applied; or bisulphuret of tin (*aurum musinum*) is dusted over so as to adhere to the pattern; and in what are called *flock papers*, dyed wools minced into powder are similarly applied. Powdered steatite, or French chalk, is used to produce the peculiar gloss known under the name of *satén*. Striped papers are sometimes made by passing the paper rapidly under a trough, which has parallel slits in its bottom through which the color is delivered; and a number of other very ingenious and beautiful contrivances have lately been applied in this important branch of art. The invention of the paper machine, by which any length of paper may be obtained, effected a great change in paper-hangings, which could formerly only be printed

upon separate sheets, and were much more inconvenient to print as well as to apply to the walls.

Papier-mache, a name given to articles manufactured of the pulp of paper, or of old paper ground up into a pulp, bleached, if necessary, and moulded into various forms. This article has lately been used upon an extensive scale for the manufacture of mouldings, rosettes, and other architectural ornaments; pilasters, capitals, and even figures as large as life, have also been made of it. It is lighter, more durable, and less brittle and liable to damage than plaster, and admits of being colored, gilt, or otherwise ornamented. Another article sometimes goes under the same name which is more like pasteboard, consisting of sheets of paper pasted or glued and powerfully pressed together, so as to acquire, when dry, the hardness of board, and yet to admit, while moist, of curvature and flexure: tea-trays, waiters, snuff-boxes, and similar articles are thus prepared, and afterward carefully covered by Japan or other varnishes, and often beautifully ornamented by figures or landscapes and other devices, etc., occasionally inlaid with mother of pearl. A mixture of sulphate of iron, quicklime, and glue, or white of egg, with the pulp for papier-mache, renders it to a greater extent water-proof; and the further addition of borax and phosphate of soda contributes to make it almost fire-proof. The chief papier-mache manufactory in England is that of Bielefeld, in Wellington Street, Strand, who has recently published a concise history of the manufacture, embellished with numerous illustrations. There are manufactories of papier-mache goods now established in Massachusetts. For the imports of articles of papier-mache, see PAPER.

Para, or Belem, a sea-port city of Brazil, capital of the province, 70 miles from the Atlantic, latitude of Fort St. Pedro $1^{\circ} 28' S$, long. $48^{\circ} 30' 5'' W$. Population estimated at 10,000, mostly of European descent. It stands on elevated ground, on the south shore of the Bay of Guajara, on the right bank of the Para, or Tocantins, and has a fine appearance from the river. Chief edifices, the governor's palace, cathedral, several other churches, convents, barracks, arsenal, episcopal palace and seminary, formerly a Jesuits' college; a prison, and an unfinished theatre. Vessels of large draft can lie near the city, and the cocoa, caoutchouc, isinglass, rice, and drugs, exported from Brazil are chiefly from Para. It has also a trade in cotton, vanilla, annatto, dye-woods, honey, wax, and a great variety of other vegetable and animal products. The trade is mostly with Liverpool, London, Barbadoes, Cayenne, and the North American and other Brazilian ports. The River Para, bounding the island of Marajo southward, extends between long. $48^{\circ} 10'$ and $50^{\circ} 40' W$, receives the Tocantins and Annapu from the south, and is connected northward with the Amazon.

Para enjoys an advantage possessed by no other sea-port town in Brazil—that of an unobstructed intercourse by water with the interior. The commercial resources of this province, and the admirable trading position of the city, are unsurpassed; but inhabitants are wanting to develop these elements of commerce and civilization. In 1840, some American citizens established several saw-mills at Maguary, in the vicinity of Para; but whether they met with better success than did the Glasgow merchants, whose property to the amount of \$350,000 was pillaged in the same place during a revolt in 1835, has not been ascertained. The cotton of Para has been highly prized. Caoutchouc, the use of which was first discovered in 1735 by French academicians sent to Brazil to make astronomical observations, is abundant, and is extensively manufactured into shoes, etc. Were this article admitted into the United States, as in England, free of duty, it would become one of the staple exports to this country. A well-informed American merchant, residing at Para, addressed a letter on this subject to one of the officers of Lieutenant Herndon's expedition to the Amazon,

urging the disadvantages under which American commerce labors, as compared with that of Great Britain, in the caoutchouc trade.—See "Letter from the Secretary of the Treasury, transmitting copy of circular letter and replies thereto, in reference to the Tariff, March 8, 1854." This article is now becoming the chief staple of the province of Para; and so various and multifarious are the uses to which it is applicable, both in the arts and in domestic economy—so important as an article of commerce has it already become, that, even against the import duty of 10 per cent. in the United States, it constitutes almost 50 per cent. of our trade with Para. The following statement exhibits the quantities of India-rubber imported from Para into the United States during the years designated:

	Pounds.	Value.
1850.....	1,500,000
1854.....	3,330,000
1855.....	2,740,000	\$1,660,000

The exports from Para to foreign countries consist of caoutchouc, cotton, rice, castor-oil, copaiva, seed oil, cocoa, cloves, cinnamon, hides, horns, isinglass, Peruvian bark, etc. From 1816 to 1827, the exports from this province averaged annually \$850,131. The following summary exhibits the total trade of Para for 1845: Inward—Vessels, 69; tonnage, 11,136; value of cargoes, \$495,940; of which there entered from the United States: Vessels, 28; tonnage, 3920; value of cargoes, \$236,200. Cleared to all countries—Vessels, 70; tonnage, 11,445; value of cargoes, \$737,525. To the United States—Vessels, 27; tonnage, 3629; value of cargoes, \$261,620. In this province, the sugar and coffee plantations do not produce sufficient for home consumption, and supplies are usually imported from the neighboring provinces. The imports from foreign countries consist of cotton goods, silks, hardware, wines, spirits, salt, flour, salt provisions, gunpowder, etc. The only manufactures are ordinary cotton cloths for sacks and hammocks, and India-rubber shoes; but these manufactures seem not to thrive, from a want of skill to direct them.

TOTAL NUMBER OF VESSELS, WITH THEIR TONNAGE, ENGAGED IN THE TRADE BETWEEN PARA AND FOREIGN COUNTRIES, AND VALUE OF EXPORTS AND IMPORTS, ETC., IN 1843 AND 1850.

1843.	Vessels.	Tons.	France.
Entered.....	83	12,528	Imports, 3,295,000
Cleared.....	83	12,029	Exports, 4,881,000
1850.			
Entered.....	96	16,877	Imports, 5,109,000
Cleared.....	92	16,433	Exports, 7,482,000

STAPLE PRODUCTIONS OF PARA, RELATIVELY CONSIDERED, WITH RESPECT TO THE QUANTITIES ANNUALLY EXPORTED:

Caoutchouc.....	33,600 arrobas.
Cocoa.....	200,000 "
Cotton.....	6,120 "
Hides.....	15,500 pieces.
Copaiva.....	2,300 pots.
Rice.....	130,000 arrobas.
Rice in the husk.....	26,000 alcuieres.
Sugar.....	21,230 arrobas.
India-rubber shoes.....	192,000 pairs.

The above are the leading exports from Para; but, besides these, the province produces various kinds of timber admirably adapted for ship-building purposes, and a great variety of textile plants, medicinal drugs, and dye-woods of the richest qualities. The present population of Para is about 205,000, though the province is said to be capable of maintaining some millions of inhabitants. With such a population, its natural resources might be more fully developed, and Para thus placed, in point of position and commercial importance, in the very first rank of Brazilian ports.—*Commercial Relations with the United States.*

Paraguay, a republic or consularship of South America, extends from lat. 21° to 27° 20' S., and long. 54° to 58° 40' W. The space thus inclosed forms a very compact territory, nearly in the shape of a parallelogram, about 480 miles long, north to south, with an average

breadth of about 200 miles, and contains an area of about 86,000 square miles. Population 300,000. Capital, Asuncion. The name Paraguay at one time was used in a very extensive sense, so as to include the whole of the immense regions of South America, between lat. 16° S., and the Strait of Magellan, and between Chili and Peru on the west, and Brazil on the east, now confined to the republic properly so called. On the north the limits of this state with Brazil are not definitely settled, but in other directions it has the advantage of great natural boundaries; the Parana on the east and south, and its tributary the Paraguay on the west. The whole surface thus belongs to the basins of these two rivers, a mountain range of considerable elevation stretching between them north to south, so as to form their water-shed, and send the drainage in opposite directions, but nearly in equal portions. The distance of the water-shed from the river scarcely any where exceeds 100 miles, and hence the tributaries by which the drainage is conveyed are more remarkable for their number than their magnitude. By far the largest is the Tibimari, which, owing to an eastern bend in the water-shed, has its course considerably prolonged, and being augmented by several large affluents from the north, becomes a noble stream before it reaches the Paraguay. The surface is mountainous in the centre, and also in the northeast, where a ramification, known by the name of the Sierra de Maracay, or Cordillera de Maracara, breaks off from the central chain, and proceeding east to the banks of the Parana, interrupts the navigation of that river, and forms one of the most remarkable cataracts in the world.

Paraguay is one of the finest countries in the world. It is almost inclosed by rivers, and the interior is also bountifully watered. The exterior waters are navigable, and constitute the great avenues which are destined to become the highways of the commerce of a magnificent interior country. Unlike the open countries surrounding it, Paraguay is well wooded, and among its trees are many valuable in the arts and manufactures. It also abounds in medicinal products, as rhubarb, sarsaparilla, jalap, sassafras, dragon's blood, copaiva, nux vomica, liquorice, ginger, etc., all of the finest quality. Of dye-stuffs, too, there is an immense variety; as cochineal, indigo, vegetable vermilion, saffron, etc. Many of the forest trees yield valuable gums, and they comprise some of the most delicious perfumes and incense that can be imagined. Others, again, are like amber, hard, brittle, and insoluble in water. The *seringa*, or rubber-tree, the product of which is now almost a monopoly with Para, and also the *palosanto*, which produces the gum guaiacum, crowd the forests, and the sweet-flavored vanilla is abundant. Upon the hills the celebrated yerba maté flourishes luxuriantly. The cultivated products are sugar-cane, cotton, tobacco, rice, mandioca, Indian corn, etc. On the plains thousands of cattle range, and large quantities of hides, hair, horns, bones, tallow, etc., are lost for want of transportation. The country is not celebrated for its minerals; but in all that constitutes an agricultural country, rich lands, a fine climate, and abundance of water, it has no equal. Hitherto, however, it has been shut out from the world by the arbitrary will of despotism; and its future commerce can only be measured from its resources and facilities. The recent revolutions in the states of the Plata have opened the magnificent rivers of this country, and there is certainly no further impediment to commercial enterprise.

This state, formerly a province of Buenos Ayres, withdrew from the connection in 1811, and the Spanish-American revolution breaking out about that date secured it from molestation. The policy of its rulers has been the exclusion of foreigners from the country, and under Dr. Francia, so celebrated in connection with its annals, the utmost despotism was exercised. The tyrant dying in 1840 the government was changed in its character, and a more liberal policy obtained,

and ultimately it has become in form an elective republic. As early as 1842, Paraguay acceded to the opening of its rivers to foreign commerce; but until the overthrow of Rosas, the tyrant of Buenos Ayres, who exercised authority over the estuary of the Plata, the concession was of no value. The successors of Rosas have now fully conceded free ingress and egress with the sea. These important revolutions in the policy of the two countries will eventuate in the development of the vast resources of the southeastern and middle portions of South America—countries which are unsurpassed in agricultural wealth and valuable commercial staples. For further information, see *American Statistical Annual*; *American Whig Review*, vi. 245 (U. S. Consul HOPKINS); *North American Review*, xxvi. 444 (A. H. EVERETT); *Dublin University*, xii. 474; *Quarterly Review*, xxvi. 277.

The commercial policy of Paraguay, however, is not of that liberal character to attract foreign merchants to its ports. In addition to the expense of purchasing stamped paper, by means of which every official transaction in the republic is conducted, and without which foreign merchants can not enter the markets, the internal taxes are such as to discourage efforts to develop the resources of the country, and, as a consequence, to oppress its commercial industry. The aggregate of these taxes bearing specially upon commerce is stated to amount to 26 per cent. on the value of every article sent to market. They consist of *diezmos* (tithes), 10 per cent.; export duty, 10 per cent.; and on rent of lands (almost wholly owned by the state, and fixed at a high valuation) 6 per cent. If to this be added an import duty of 20 per cent. on almost every article which the United States could send to the markets of Paraguay, it can be readily comprehended why the name of this republic does not appear among those of other foreign nations the details of whose commerce are minutely set forth in the annual Report on Commerce and Navigation, prepared by the Department of the Treasury of the United States. The "stamps," to which allusion has been made, are divided into eight classes: those of the first class cost 25 cents; of the second, 37½ cents; of the third, \$1; of the fourth, \$2; of the fifth, \$6; of the sixth, \$8; of the seventh, \$16; of the eighth, \$26. Permission to discharge or to load a vessel of 21 tons, or 2000 tons, can only be obtained on a stamp of this last description; so that to unload a cargo valued at \$100 will cost \$26—all the same as if it were worth \$100,000; and in like manner as to taking cargo on board. The foreign trade of Paraguay is conducted chiefly through the ports of the Argentine Confederation, especially that of Buenos Ayres, and those of the Republic of Uruguay. The exports consist of yerba maté (with which the hills of the country are literally covered), tobacco, cigars, woods, hides, hair, leather, molasses, rum, white starch, mandioca, peanuts, beans, and oranges; of which latter article not less than 30,000 bushels are said to be exported per month. The exports from the United States which would most readily find a market in Paraguay are cotton domestics, calicoes, plain cloths, clocks, boots and shoes, gunpowder and shot, saddlery, and agricultural implements.

If the navigation of the River Vermejo, an affluent of the Paraguay, were opened to foreign commerce, or were even permitted to the Argentine flag, the United States would, it is believed, soon enjoy the entire foreign trade of the upper provinces of the Argentine Confederation. This privilege, however, is refused by the government of Paraguay, notwithstanding the River Vermejo, in its entire course, lies within the territories of the sister republic. Hitherto a selfish and illiberal policy excluded foreign vessels from the port of Albuquerque, a place 1600 miles above Asuncion, the capital of Paraguay, in the Brazilian province of Matto Grosso, which the government of that empire has declared open to the commerce of the world. Brazilian vessels were not permitted to descend the River Paraguay, which

takes its rise in this province, nor are foreign vessels allowed to ascend higher than the city of Asuncion; thus cutting off all trade with the richest portions of Bolivia and the fertile province of Matto Grosso, in Brazil. The claim of Paraguay to exercise jurisdiction over both banks of this river, by prohibiting its navigation above Asuncion, and by closing the navigation of the Vermejo, both to the citizens of the Argentine Republic and to foreigners, has never been admitted.

A treaty between Paraguay and Brazil was duly signed and ratified June 14, 1856, by which it is stipulated that the waters of the Upper Paraguay shall henceforth be open to general navigation and commerce. This will bring not only the produce of the Brazilian province of Matto Grosso, but also the agricultural and mineral wealth of Bolivia, to an Atlantic market. The value of these mineral resources may be inferred from the fact that there are stated to exist in this region upward of a thousand valuable mines unworked, it having been found impossible hitherto to convey machinery thither, across the mountains, from the Pacific coast. A highway to the spot is now opened from the Atlantic, as broad as the Mississippi, and equally accessible. The rich province of Matto Grosso, with its diamonds, gold, silver, and copper, is also brought in connection with the good and contiguous sea-ports, Buenos Ayres and Montevideo, by the Paraguay River; and Cujaba, its capital, in the centre of the mining districts, can easily be reached from Asuncion. Dianantino, about two hundred miles from Cujaba, sends its produce to Santarem, on the Amazon, and thence to Para. This tedious and circuitous route is now superseded, as the Paraguay connects these markets with the estuary of the Plata. A Paraguayan journal, "*La Nacional*," of August 11, 1856, publishes the subjoined regulations: "All vessels from foreign ports to the Brazilian ports above shall take pilots at Asuncion, Concepcion, the junction of the Apa, and Olimpo. The vessels that descend that river from the upper Paraguay are obliged to take pilots from Olimpo, the junction of the Apa, and Concepcion; and the wages of the said pilots are to be agreed upon at the captain of the port's bureau in Asuncion."

In 1853, the United States steamer *Water Witch*, of 400 tons burden, and nine feet draught, was dispatched, under the command of Lieutenant Thomas J. Page, to make an exploration and survey of the tributaries of the River La Plata. The results of this expedition will, doubtless, contribute in an eminent degree to the advancement of commerce and the promotion of science. The navigation of the Paraguay River, which empties into the Parana at the distance from Buenos Ayres of 800 miles, was extended to the parallel of 18° south latitude; making the entire distance of the rivers Parana and Paraguay, through which this small sea-steamer had passed from Buenos Ayres to Corumba (an interior military post of Brazil), equal to about 1700 miles. There is no doubt that the navigation of the Paraguay, during the season of high water, could have been carried by the *Water Witch* to a still greater extent; but at the time of this exploration any further ascent was prohibited by Brazil. Permission was, however, subsequently granted by the imperial government, but refused by that of Paraguay. The expedition was thus restricted to a more limited exploration of the upper waters of this river than had been anticipated. It is to be hoped that the time is not far distant when all such prohibitions will be removed, and this interesting region of unknown country brought to the knowledge of the world.

The navigation of the Paraguay has thus been extended beyond Asuncion, to the distance of 650 miles. This fact has induced the Brazilian government to avail itself of this important channel of communication, by steam, with her northwestern province, Matto Grasso, in which is found the most valuable diamond region of the empire.

An expedition was dispatched by the French government, a few years since, for the exploration of the Parana and Paraguay rivers; and the following passage is translated from a report made in March, 1855, by Captain Picard, to whose charge it had been committed: "When we consider the excellent means of communication which nature has opened to the provinces of the Argentine Confederation and the Republic of Paraguay, we can not but regret to see them unemployed and deserted. The absence of population, continual civil war, and the administrative policy of Paraguay, have, so far, been the chief obstacles to progress. Let us indulge the hope that the day is not distant when the aspect of things will change, and these magnificent countries will flourish under the blessings of a more advanced civilization."

Paraguay can hardly be said to possess a merchant marine. In 1851 there were distributed, between the two ports of Asuncion and Villa del Pilar, 12 vessels, averaging each about 42 tons. In 1852 there were 11 of the same description, and in 1853 only 9. Besides these, there is one brig belonging to the government, which is said to monopolize almost exclusively the commerce of the state. The foreign vessels engaged in the trade of Paraguay in 1852 were 81, with an aggregate of 4582 tons, from the Argentine provinces south, below the Paraguay River, and three American vessels, tonnage not known. All these vessels trade with the ports of Asuncion and Villa del Pilar, which, with the port of Encarnacion, on the Parana, were alone open to foreign commerce. There is no treaty between the United States and Paraguay. With England a treaty was ratified November 2, 1853, by the second article of which the Republic of Paraguay concedes to the merchant flag of Great Britain the free navigation of the River Paraguay as far as Asuncion, the capital of the republic, and of the right side of the Parana, from where it belongs to her, as far as the city of Encarnacion. It stipulates, also, that British subjects shall be at liberty, with their ships and cargoes, freely and securely to come to, and to leave, all the places and ports of the said territories; hire houses and warehouses; and trade in all kinds of produce, manufactures, and merchandise of lawful commerce, subject to the usages and established customs of the country; also, that they may discharge the whole or part of their cargo at the ports of Pilar and where commerce with other nations may be permitted, or proceed with the whole or part of their cargo to the port of Asuncion, according as the captain, owner, or other duly authorized person shall deem expedient; and that, in the same manner, shall be treated and considered such Paraguayan citizens as shall arrive at the ports of Great Britain with cargoes in Paraguayan or British vessels.

There is an American company established in Paraguay, under a charter from the State of Rhode Island, which has been engaged in commercial operations for some time, under the title of "The United States and Paraguay Navigation Company." The chief object of this company is to introduce steam navigation on the rivers of Paraguay; but how far it has progressed in the accomplishment of this object, information is not at hand. The only direct trade, however, yet opened between the United States and this republic consists of some shipments of cigars and samples of wood made by this company. All other articles of Paraguayan produce which reach the United States come through the ports of Buenos Ayres or Montevideo, and are included in the custom-house returns to the Treasury Department of exports from the republics to which these places respectively belong.

The government of Paraguay puts forth no statistics relative to the commercial movements of the republic, and it is said to be quite impossible to obtain information on the subject from its administrative officials. Complete commercial statistics, which may be viewed as strictly accurate, can not, therefore, be looked for in

this Digest; but the subjoined statements, derived from a Memoir prepared in 1853 by M. L. Geoffroy, an attaché of the mission extraordinary sent by France to the Plata and Paraguay, are, no doubt, reliable, so far as they extend.

EXPORTS OF ASUNCION FROM JULY, 1851, TO DECEMBER 31, 1852.

Tobacco—229,000 arrobas, at 12 reals (or \$1 50)	
per arroba of 25 pounds	\$843,500
Yerba maté—175,000 arrobas, at 20 reals per arroba	437,500
Ilides—Dry, 100,000, at 10 reals each	125,000
" Tanned, 35,000, at \$3 each	105,000
Wood—Cedar, 50,000 yards, at 4 reals	25,000
" Cabinet, asloop-load of 7000 to 8000 arrobas	6,000
Hair—600 quintals, at \$8 per quintal	4,800
Sweetmeats—20,000 arrobas, at 6 reals per arroba	15,000
Cigars—2,000,000, at \$2 per 1000	4,000
" 250,000, at \$5 per 1000 (in boxes of 100)	1,250
Sundry products—White wax, rum, molasses (several cargoes), common wood (Urunday and Lapacho), several cargoes of oranges, maize, pulse, etc.; cotton, 1,500 arrobas; tiger-skins, 500, at \$2 each; India rubber, other-skins, hammocks, baskets, etc.; fringed napkins, lace, etc.	27,800
Total	\$1,094,850

It is believed that the above total might be increased at least one-third, could exact statements be obtained. If we add the export duties of 10 and 6 per cent. on the articles exported—yerba and wood, which are government monopolies, and are exempt from duty, being excepted, and which would amount to about \$70,000—and \$20,000 in silver, exported in contraband, and \$10,000 for sundry charges—we have \$1,500,000, or an amount equal to the value of imports during the same period. Indeed, such is the scarcity of money in circulation, that the trade is necessarily one of barter; so that the figures which represent the value of imports may also, generally, give the value of exports.

Measures.—The arroba equals 25 lbs.; the cubic vara about 20½ cubic feet; the pesada 36 lbs.; the almude about three-fourths of a bushel; the asmbre about one quart; the frasco about half a gallon; the fanega about four bushels. It may be observed, that these denominations of weight and measure represent different quantities in different countries, and even in the same countries, as regards different articles.

IMPORTS AND EXPORTS OF ASUNCION FROM 1851 TO 1854.

Years.	Imports.	Exports.	Total.	Duties paid.
1851	No data.	\$341,380	No data.	No data.
1852	\$549,159	474,499	\$1,023,658	\$123,976
1853	406,638	601,932	1,008,570	56,564
1854	535,523	777,467	1,312,990	123,289

Among the importations of 1854, tissues and wines hold the first rank, or, rather, they constitute four-fifths of the total value of imports.

Navigation.—Transportation by land being extremely difficult, the commercial movements already analyzed were effected by water—by the Paraguay, an affluent of the Parana. From the opening of the port of Asuncion in July, 1851, to December, 1852, there arrived about 120 sloops, of 6000 arrobas, on an average, for each. A cargo of 7000 arrobas equals 60 tons, which would give an average of from 40 to 80 tons for each vessel. From January 1, to February 28, 1853, there arrived at Asuncion 30 Sardinian vessels. These vessels, the owners of which, or the greater part of them, were Sardinians, sailed under the Uruguayan or Paraguayan flag. There arrived also, up to March 10, 1853, at this port, 19 sloops. In 1854 there arrived 160 merchant vessels, averaging each 50 tons burden. Of these, 2 were British, 31 were under the flag of the republic, 116 belonged to the Argentine Confederation, and 11 to Uruguay.

The customs tariff of Paraguay, now in force in that republic, is that promulgated by a decree given at Asuncion, January 2, 1846.—*Commercial Relations of the United States.*

Parallels of Latitude, on the Terrestrial Sphere, are small circles parallel to the equator; but in the Celestial Sphere they are parallel to the ecliptic.

Paramaribo, the capital town of Dutch Guiana, on the west bank of the Surinam, five miles from its mouth in the Atlantic, lat. $5^{\circ} 49' N.$, long. $55^{\circ} 22' W.$ Estimated population, 20,000, mostly blacks. It is regularly and well built; streets unpaved, but ornamented with rows of tamarind and orange trees; and it has Lutheran, Calvinistic, Roman Catholic, and English churches, Portuguese and German-Jewish synagogues, and is the centre of the trade of the colony. Fort Zeelandia, north of the town, is the residence of the governor. In a hospital for lepers, on the right bank of the Coppename, 450 patients are maintained at the expense of the colony. The Kwatta Canal, begun in 1846, is the first public work executed by free laborers.

Paramo (sometimes rendered, though incorrectly, by *desert* or *heath*). The name given in South America to a mountainous district covered with stunted trees, exposed to the winds, and in which a damp cold perpetually prevails. Under the torrid zone the Paramos are generally from 10,000 to 12,000 feet in height. Snow often falls on them, but remains only a few hours; in which respect they are distinguished from the *Nevados*, which enter the limits of perpetual snow. The Paramos are almost constantly enveloped in a cold, thick fog; so that when a thick, small rain falls, accompanied with a depression of the temperature, they say at Bogota, or at Mexico, *cae un paramito*. Hence has been formed the provincial word *emparamarse*—to be as cold as if one were on a *paramo*.—HUMBOLDT's *Pers. Nar.* ii. p. 252.

Parasang, a Persian measure of length; according to Herodotus, equal to 30 stadia, and (reckoning eight stadia to the English mile) equal to $3\frac{1}{2}$ English miles. The length of the parasang was reckoned differently by different authors; and such are the discrepant estimates of the ancients that some have assigned it the length of 60 stadia. The word is supposed to be derived from the Persian *seng*, signifying a *stone*.

Parcel, a term indifferently applied to small packages of wares, and to large lots of goods. In this latter sense, 20 hogsheads of sugar or more, if bought at one price, or in a single lot, are denominated "a parcel of sugar."

Parcels, Bill of, an account of the items composing a parcel.

Parchment and Vellum. The former consists of the skins of sheep and goats, and the latter of those of calves, prepared in such a manner as to render them suitable for being written upon, for covering books, and other purposes. The consumption of these articles is very considerable. In this and most other countries it is customary to use them instead of paper in the drawing up of a great variety of deeds and other legal instruments. They are also extensively used, especially in Italy, in the binding of books. The finest copies of the magnificent classics which issued from the Dutch presses in the 17th century, and the early part of the 18th, were all bound in vellum. Parchment is coarser than vellum, and not so well adapted for writing upon. The qualities of both articles differ very widely; so much so that the best parchment is preferable to inferior or even middling vellum. The goodness of each depends partly on the quality of the skins of which they are made, and partly, and indeed in a very high degree, on the care and skill with which they are manufactured.

The history of these articles is involved in some obscurity. Varro and Pliny (*Hist. Nat. lib. xiii. cap. 11*), who have been generally followed, state that they were originally manufactured at Pergamus, in Asia Minor, the capital city of Eumenes II., one of Alexander's successors, during the reign of that prince; and that parchment owes to this circumstance its classical name of *charta Pergamena*. But there seems to be little if any foundation for this statement. We have seen, in the preceding article on paper, that Herodotus,

who flourished rather more than a century before Alexander the Great, states distinctly that, previously to his era, when paper (*charta Egyptiaca*) was scarce, the Ionians were accustomed to write on the skins of sheep and goats, and that that practice was then followed (viz., in his time) by several barbarous nations.—Lib. v. cap. 58. And it is all but certain, seeing that the practice of writing on skins had been in use for at least 2½ centuries, and probably much more, previously to the era of Eumenes, that their preparation would, in the course of that lengthened period, be so much improved as to render them little different from parchment. It is probable, indeed, that their manufacture may have been improved in Pergamus; but we incline to think that parchment owes its name rather to the extensive demand for it in that city, in consequence of Eumenes having amassed a large and valuable library, than to any thing else. He was, in fact, compelled to use parchment and vellum in the copying of books, as his contemporary Ptolemy Philadelphus had prohibited the exportation of paper.—PLINY, *ubi supra*. The scarcity of parchment during the Middle Ages, and in antecedent times, led to the practice of obliterating the writing on old parchments, by rubbing them with pumice-stone, immersing them in boiling water, and such like devices; and there can be no manner of doubt that the prevalence of this practice has been most injurious to literature, and that it has most probably occasioned the total destruction of some of the noblest *chefs-d'œuvre* of antiquity. In the Middle Ages, these were erased that room might be made for some worthless treatise on scholastic theology or logic! Sometimes, however, it happens that the ancient writing is not so much obliterated but that it may still be read; and to that circumstance the recent discovery of a portion of Cicero's treatise *De Republica* is to be ascribed. It had been effaced to make room for a commentary of St. Augustine on the Psalms. Parchments that have been erased in this way are called *Palimpsests* (from *παλιν*, again, and *ψαω*, to efface or clean), or repeatedly cleaned parchments; because they have been repeatedly cleaned, renewed, or prepared for writing upon. If the learned world is ever to be gratified by the recovery of the lost comedies of Menander, or the lost books of Polybius, Livy, and Tacitus, it will most probably be by finding them under some homily or such like trash.—*Nouveau Traité de Diplomatique; Dom de Vaines*.

Paris (anc. *Lutetia Parisiorum*), the capital of France, and, after London, the largest and most populous city in Europe; lat. (observatory) $48^{\circ} 50' 12'' N.$, long. $79^{\circ} 23' 02'' E.$ from the national observatory, Washington, and long. $2^{\circ} 20' 30'' E.$ from London. Population in 1851, 1,021,530. Situated 193 feet above the level of the sea, on both sides and on two islands of the Seine, 111 miles from its mouth. It has recently, and at the expense of about \$100,000,000, been surrounded with fortifications, consisting of a wall 83 feet in height, bastioned and terraced, lined with a fosse about 20 feet deep, and embracing both banks of the Seine, with a continuous inclosure, and of outworks composed of 14 detached forts. These fortifications take in much of the suburbs, and even of the surrounding country; but the proper limits of the town are traced by an interior wall, erected at a much earlier date, for fiscal purposes. In this wall are 50 gates or barriers, which form the proper entrances of Paris, and at which the *octroi*, or duties on goods brought into it, are levied. Many of these barriers are magnificent structures. Among others may be specified the *Barrière de Neuilly*, consisting of two pavilions, and having in front the splendid triumphal arch *De l'Etoile*; the *Barrières de Vincennes*, de *St. Martin*, de *Fontainebleau*, de *Rouilly*, de *Chartres*, and de *Passy*. Outside the barriers and their connecting wall is a large zone, finely planted, which nearly makes the circuit of the town, and forms an excellent, though not very

much frequented, promenade. It receives the name of Outer Boulevards, to distinguish them from the Inner Boulevards, which form a similar internal zone, consisting, in their finest parts, of a magnificent central thoroughfare, bounded on either side with a double row of trees, under which a broad and elevated pathway has been formed, and lined by elegant shops and mansions, the whole forming a scene of animated gayety and splendor which no other capital in Europe can equal.

The Seine traverses the city in a west-northwest direction, and has a medium breadth of about 450 feet, nearly one-third less than that of the Thames at London. It is shallow, and navigable only by barges and small steamers. Its quays are built of solid masonry, and form large terraces, with a roadway in the centre, and a footpath on either side, generally planted. They extend about 11 miles, and, in addition to the splendid walks which they afford, serve the important purpose of protecting the lower parts of the city from inundations, from which, previously to these erections, it often suffered. The number of bridges is twenty-seven, all of stone, with the exception of seven suspension bridges, three of a combination of stone and iron, and one of wood.

Manufactures and Trade.—The government possesses only two properly manufacturing establishments—that known by the name of the Gobelins, celebrated for its tapestry and carpets, made, however, not for sale, but the supply of the palaces, and for presents; and that of tobacco, which the government holds as a monopoly, and carries on in a vast establishment on the south side of the Seine, producing about a fifth of all the snuff used in the kingdom, and yielding an annual profit estimated at \$14,000,000. In the other branches, which are free, the most important manufactures are articles of jewelry and precious metals; ebony and ivory trinkets, fine hardware, paper-hangings, saddlery, and other articles in leather; cabinet-work, carriages, various articles of dress, silk and woolen tissues, particularly shawls and carpets; lace, embroidery, artificial flowers, combs, machines, mathematical and optical instruments, types, books, engravings, refined sugar, chemical products, etc. The value of all the industrial products of Paris in 1847 was, after a very careful investigation, estimated at \$292,725,670. In 1848, during the turmoil of the last revolution, they fell to less than one half of what they were before. The value of the exports, composed almost entirely of the above articles of manufacture, was declared at the custom-house of Paris to amount in value, in 1850, to \$11,095,945. The estimated revenue of the city for 1852 was \$9,303,680; and the expenditure \$9,703,630.—See article FRANCE. For commerce, etc., of Paris, see HUNT's *Merchants' Magazine*, xviii. 60; *Quarterly Review*, lxxviii. 146; *Living Age*, ii. 404, xlii. 219; *Foreign Quarterly*, xxxi. 182; *Edinburgh Review*, lxxxv. 39; *Comm. Rel. U. S.*

The commercial intercourse between the United States and this consular district depends on the regulations of the custom laws of the empire, and on the local legislation of the city of Paris, by which *octroi* duties are levied on many articles brought into the city, whether foreign or domestic, but especially on spirits and articles of subsistence. These regulations are fixed, and rest only on the contingency of alteration by legislative enactment. There are some privileges accorded to Spain by ancient treaties which will be found set forth in the *Code des Douanes*, *Code Maritime*, and the *Tarif des Droits*. We are not aware of any privileges accorded to the commerce of other nations and denied to the United States, or of any important restrictions. The books referred to above give full information, in tabular statements, on this question. The transhipment of goods belongs to the coasting trade, and, by law, only French vessels are entitled to engage in this trade. Full information will be found upon this point in the *Code Maritime*.

Rates of insurance, by steamers, on goods,	$\frac{1}{2}$ to $1\frac{1}{2}$ per cent.
“ “ by ships,	1 to $1\frac{1}{2}$ “
“ “ by steamers, valuables,	$\frac{1}{2}$ to $\frac{1}{4}$ “
“ “ by ships,	$\frac{1}{2}$ to 1 “

Commissions for shipping,..... 3 francs each package.

Commissions for purchasing in large quantities..... 3 per cent.

Commissions for purchasing in small quantities..... 5 “

Average rate of exchange between New York and Paris..... 5 13 $\frac{1}{2}$ francs.

Sales of goods are made upon cash or upon orders, with credits from thirty days to six months. Commission houses are in the habit of advancing for many of their customers.—See *Tarif des Droits*, *Regulations des Douanes*, and *Statistique Industriel*.

Parrel. In *Naval language*, the collar of greased rope, or trucks, by which the yard is confined to the mast, while it slides up and down it.

Partnership. A partnership is an agreement between two or more to share in the profit and loss of the use and application of their capital, labor, and skill, in some lawful business, whether one supplies capital, and another skill and labor, or each both labor and capital. The benefits of a union of the means and advantages of different persons for the conduct of a branch of business, in many instances, are too obvious and common to need illustration. A partnership is not constituted merely by an interest of different parties in the same thing, but it depends on a participation of profits and joint liability to loss. And yet there are some exceptions to this rule, for it has been held that seamen shipping on shares in a shipping voyage are not copartners with the owners. And so, where a certain share or commission is allowed to a clerk or agent, depending on the success of the business or amount of profits, in addition to his other compensation, it has been held, in many cases, not to make him a copartner. It is difficult to point out the criterion by which cases of this description are distinguished from those of copartnership; and some of them look more like an exception of cases which strictly come within the definition of copartnership. A question has been made whether joint owners of a ship are copartners, and the general doctrine is that they are not so; and yet it is generally held that each one is liable for the whole amount of repairs and expenditures in the navigation of the ship; but still the ownership is not joint, for, in the case of the decease of one, the property in the whole ship does not survive to the others, as would be the case if it were partnership property, but the property is held in common, each part-owner having a distinct title to his share; and one part-owner can not, merely as such, convey a title to the whole ship, or to any share except his own. As to the share of each partner in the profits, or his liability for losses, if there is no agreement on this subject, all the partners stand upon an equal footing.

As to the objects of copartnership, they are not confined to commerce, though most frequent in that branch of industry, but may embrace manufacturing, the carrying on of any mechanic art, agriculture, the practice of law or medicine, and, in short, every lawful branch of business. Copartnership is more usually formed by a written agreement; and by some codes and in regard to certain copartnerships, formal stipulations are required by law in order to constitute a copartnership. This is not a general rule, however, for in many branches of business parties may agree orally for a participation in profit and loss. These associations are divided into different classes, distinguished by their objects, and the extent of the liability of each partner. The Roman law allowed of general copartnerships, extending the community of property, and joint profit and loss, not only to the business pursued, but also to all acquisitions by either party, whether by legacy, inheritance, gift, or as the fruits of industry. By that law, and so by the laws of France, Spain, Louisiana, and other codes derived from the Roman law, a man and his wife may

be copartners; and, in making the marriage contract, the kind and extent of copartnership is agreed upon, the form of the stipulation for this purpose being particularly pointed out by the French code. It was between the parties to the marriage contract that the general copartnerships above-mentioned were most frequently formed. In this respect, however, the Roman law, and those codes derived principally from it, leave the parties at liberty to agree upon a universal copartnership or a limited one, or a separate property.

Copartnerships are usually confined to the prosecution of a particular branch of business, and it very often happens that each copartner is concerned in other branches. The term *general copartnership* is also applied to one formed for trade generally, or business generally, without limitations; but where the joint interest extends only to a particular concern, as, for instance, the freighting of a ship, it is called a *special copartnership*. And so a partnership is called *special* when the parties enter into stipulations modifying and restraining the right and powers of the members, instead of leaving them to the operation of the laws generally applicable to such associations; and this is the usual meaning of such copartnerships. Another description is that of *limited copartnerships*, in which one or more partners put in a certain amount of capital, which is liable for the contracts of the firm; but beyond this the party or parties are not liable. This sort of partnership is particularly provided for in the French code, and is not unfrequent in France. It is a very useful provision of the law that allows of such associations, for it enables persons of fortune, and retired from business, to put a part of their capital at risk in trade, without risking their whole property; and it accordingly operates very favorably upon the enterprise of the community; for a young man who has only his talents and industry to put into a concern can thus more easily obtain the capital necessary to give his activity and enterprise scope, and every community ought to open all practicable channels for the intellectual and physical exertions of its members. This species of copartnership has accordingly been partially introduced into the United States, being provided for in the code of Louisiana, which is modeled on the French code, and having been introduced also into the laws of New York by a statute, the provisions of which were closely copied from the French code—the first instance (as Chancellor Kent remarks in his Commentaries) in which any other foreign law than the English had been adopted in the particular structure and provisions of an American statute, in those States of whose codes the English law is the basis. This species of partnerships has also been authorized by statute in Massachusetts, Rhode Island, Connecticut, Vermont, New Jersey, Pennsylvania, Maryland, South Carolina, Georgia, Alabama, Florida, Mississippi, Indiana, and Michigan. We will now proceed to a more extended account of limited partnerships.

The condition of a limited partnership is that the name of the person whose liability is thus limited must be used in the firm, and particular provisions are made as to paying in the amount of capital stipulated; and another suitable provision in such case is the provision for some registry by which it may appear to those who wish to make the inquiry what amount such partner pays in. Some partnerships are *secret*; that is, some one agrees, upon terms, to share profits with ostensible partners without any notice to the public of his being a member of the firm. Each partner has a joint interest in the whole personal property, and, unless the articles stipulate otherwise, may transfer it.

Each partner may also bind the whole firm by his contract made in the course of the business of the firm, unless it be otherwise agreed between them; and even when it is otherwise agreed, still, if a party with whom a partner contracts has a legal right, from the manner in which the joint affairs are managed, to presume that

a partner is authorized to contract for and to bind his copartners in regard to the subject of any contract, the firm will be bound by such contract. But if the party contracted with has notice that, by the articles of copartnership, a partner has not authority to make a contract, the company will not be bound by it. So if a partner contracts, in the partnership name, in a manner which the party contracted with knows is not within the business of the firm—as if he makes a negotiable note in the name of the firm for his own separate debt—the contract will not bind the firm to the party thus contracted with; but still, if this contract, being transferable in its nature, and holding out on the face of it the responsibility of the whole firm, is negotiated to those who have no notice that the paper was made for the private accommodation of the partner who signed the partnership name, the company will be bound in respect to such assignee; that is, the firm having given notice to the world that they are copartners in a certain branch of business, every one has a right to presume that all acts done by each of them in regard to it are authorized by the terms of their contract, or the circumstances of the case, unless he has notice to the contrary. But certain acts are not authorized by the general powers of copartners, and those no one partner can be presumed to have power to do; as, for instance, one partner is not merely, as such, authorized to make a deed in the name of the other, or to act as his attorney; and he can not, accordingly, convey land belonging to the members of the company; for, though it may have been acquired and paid for with the property of the firm, yet when acquired, it belongs to the members in common, if the title be in them all, and each member can himself convey only his share; and in order to the conveyance of that of another, he must be specially empowered. But a partner may release a debt due to the firm if it be done fairly, and without collusion between him and the debtor. It has been held, however, that one partner can not by deed submit a question to arbitration. A partnership may be dissolved by its own limitation, the death, bankruptcy, or insanity of a member, or by the breaking out of a war between the countries to which the members belong.

A question is also made whether a member may dissolve the copartnership voluntarily before the time for which it was formed expires, and the opinion seems to be that he may do so by giving sufficient notice to this effect; and this seems to be necessarily incident to new associations; for, though he would, in such case, be answerable to his copartners for the breach of his agreement, yet it would be exceedingly inconvenient if a partner were irrevocably bound to give his copartners the right of his credit, and of disposing of his property, after all his confidence in them had ceased. In case of mismanagement by any partner having charge of the partnership effects, so that the other partners are liable to be materially injured, they may make application to a Court of Chancery to appoint a receiver to take charge of the concerns of the company, and wind up its affairs, in case the partnership has already been dissolved, or in case there appears sufficient reason to dissolve it. But where there is no ground for such application to a Court of Chancery, and the company is dissolved by the death of one partner, the joint property will survive to the other partner, who may dispose of it, and collect and pay the debts of the concern, and will be liable to account to the personal representatives of the deceased partner for his proportion of the surplus property. In case of the decease of a partner, his personal representatives do not become copartners with the surviving partners, but the affairs of the concern must be settled with reference to the time of the death of the deceased partner.—E. A.

Limited Partnership in New York.—1. According to the Revised Statutes of the State of New York, limited partnership for transaction of any mercantile, mechanical, or manufacturing business within the State may

be formed of two or more persons; but the provisions of the act will not authorize any such partnership for the purpose of banking or making insurance. 2. Such partnerships may consist of one or more persons, who shall be called general partners, and who shall be jointly and severally responsible, as general partners now are by law; and one or more persons who shall contribute, in actual cash payments, a specific sum as capital to the common stock, who shall be called special partners, and who shall not be liable for the debts of the partnership beyond the fund so contributed by him or them to the capital. 3. The general partners only shall be authorized to transact business and sign for the partnership, and to bind the same. 4. The persons desirous of forming such partnership shall make, and severally sign, a certificate, which shall contain: I. The name or firm under which such partnership is to be conducted. II. The general nature of the business to be transacted. III. The names of all the general and special partners interested therein, distinguishing which are general and which are special partners, and their respective places of residence. IV. The amount of capital which each special partner shall have contributed to the common stock. V. The period at which the partnership is to commence, and the period at which it shall terminate. 5. The certificate shall be acknowledged by the several persons signing the same, before the Chancellor, a Justice of the Supreme Court, a Circuit Judge, or a Judge of the County Courts; and such acknowledgment shall be made and certified in the same manner as the acknowledgment of conveyance of land. 6. The certificate so acknowledged and certified shall be filed in the office of the clerk of the county in which the principal place of business of the partnership shall be situated, and shall also be recorded by him at large in a book to be kept for the purpose, open to public inspection. If the partnership shall have places of business situated in different counties, a transcript of the certificate, and of the acknowledgment thereof, duly certified by the clerk in whose office it shall be filed, under his official seal, shall be filed and recorded in like manner in the office of the clerk of every such county. 7. At the time of filing the original certificate, with the evidence of the acknowledgment thereof, as before described, an affidavit of one or more of the general partners shall also be filed in the same office, stating that the sums specified in the certificate to have been contributed by each of the special partners to the common stock have been actually and in good faith paid in cash. 8. No such partnership shall be deemed to have been formed until a certificate shall have been made, acknowledged, filed, and recorded, nor until an affidavit shall have been filed, as above directed; and if any false statement be made in such certificate or affidavit, all the persons interested in such partnership shall be liable for all the engagements thereof as general partners. 9. The partners shall publish the terms of the partnership, when registered, for at least six weeks immediately after such registry, in two newspapers, to be designated by the clerk of the county in which such registry shall be made, and to be published in the senate district in which their business shall be carried on; and if such publication be not made, the partnership shall be deemed general. 10. Affidavits of the publication of such notice, by the printers of the newspapers in which the same shall be published, may be filed with the clerk directing the same, and shall be evidence of the facts therein contained. 11. Every renewal or continuance of such partnership beyond the time originally fixed for its duration shall be certified, acknowledged, and recorded, and an affidavit of a general partner be made and filed, and notice be given in the manner herein required for its original formation; and every such partnership which shall be otherwise renewed or continued shall be deemed a general partnership. 12. Every alteration which shall be made in the names of the partners, in the nature of

the business, or in the capital or shares thereof, or in any other matter specified in the original certificate, shall be deemed a dissolution of the partnership; and every such partnership which shall in any manner be carried on after any such alteration shall have been made, shall be deemed a general partnership, unless renewed as a special partnership, according to the provisions of last section. 13. The business of the partnership shall be conducted under a firm, in which the names of the general partners only shall be inserted, without the addition of the word "Company," or any other general term; and if the name of any special partner shall be used in such firm, with his privy, he shall be deemed a general partner. 14. Suits in relation to the business of the partnership may be brought and conducted by and against the general partners, in the same manner as if there were no special partners. 15. No part of the sum which any special partner shall have contributed to the capital stock shall be withdrawn by him, or paid and transferred to him, in the shape of dividends, profits, or otherwise, at any time during the continuance of the partnership; but any partner may annually receive lawful interest on the sum so contributed by him, if the payment of such interest shall not reduce the original amount of such capital; and if, after the payment of such interest, any profits shall remain to be divided, he may also receive his portion of such profits. 16. If it shall appear that, by the payment of interest or profits to any special partner, the original capital has been reduced, the partner receiving the same shall be bound to restore the amount necessary to make good his share of capital with interest. 17. A special partner may, from time to time, examine into the state and progress of the partnership concerns, and may advise as to their management; but he shall not transact any business on account of the partnership, nor be employed for that purpose as agent, attorney, or otherwise. If he shall interfere contrary to these provisions, he shall be deemed a general partner. 18. The general partners shall be liable to account to each other, and to the special partners, for their management of the concern, both in law and equity, as other partners now are by law. 19. Every partner who shall be guilty of any fraud in the affairs of the partnership shall be liable civilly to the party injured to the extent of the damage, and shall also be liable to an indictment for a misdemeanor, punishable by fine or imprisonment, or both, in the discretion of the court by which he shall be tried. 20. Every sale, assignment, or transfer of any of the property or effects of such partnership, made by such partnership when insolvent, or in contemplation of insolvency, or after, or in contemplation of the insolvency of any partner, with the intent of giving a preference to any creditor of such partnership or insolvent partner, over other creditors of such partnership, and every judgment conferred, lien created, or security given by such partnership under the like circumstances, and with the like intent, shall be void, as against the creditors of such partnership. 21. Every such sale, assignment, or transfer of any of the property or effects of a general or special partner, made by such general or special partner when insolvent, or in contemplation of insolvency, or after, or in contemplation of the insolvency of the partnership, with the intent of giving to any creditor of his own, or of the partnership, a preference over creditors of the partnership, and every judgment conferred, lien created, or security given by any such partner under the like circumstances, and with the like intent, shall be void, as against the creditors of the partnership. 22. Every special partner who shall violate any provision of the two last preceding sections, and who shall concur in and assent to any such violation by the partnership, or by any individual partner, shall be liable as a general partner. 23. In case of the insolvency or bankruptcy of the partnership, no special partner shall, under any circumstances, be allowed to

claim as a creditor until the claims of all the other creditors of the partnership shall be satisfied. 24. No dissolution of such partnership by the acts of the parties shall take place previous to the time specified in the certificate of its formation, or in the certificate of its renewal, until a notice of such dissolution shall have been filed and recorded in the clerk's office in which the original certificate was recorded, and published once in each week for four weeks in a newspaper printed in each of the counties where the partnership may have places of business, and in the State papers.—LEONE LEVI's *Commercial Law of the World*.

Analysis of the general Law of Partnerships.—Partnership in Great Britain is a contract entirely free, and subject to no formalities; it belongs to the parties themselves to regulate the conditions; the law is merely circumscribed in protecting the rights of third parties, and to see them respected. Partnership in common law is divided into three classes—universal, general, and limited or special. They are also divided into private partnerships and public companies. Public companies are divided into unincorporated companies or associations, and incorporated companies, and corporations chartered by government. By the law of Scotland partnerships are divided into ordinary partnerships, joint-stock companies, and public companies. In the first the firm is a distinct person at law, and the partners, although jointly and severally liable for all the debts and contracts of the firm, are so as guarantors of the firm. This is general partnership. Special partnership is one contracted for a particular branch of business.

There are principles connected with the law which are identical in every country; namely, that all members of an ostensible partnership, or in collective name, are responsible in *solidum*; but differences appear in points regarding the continuation or cessation of partnership after the decease of one of the partners. Thus in Prussia or Frankfort, the heirs continue the partnership until the end of the year, and if they do not give notice of their retirement, or if they are not excluded by the other partners, they do not cease to form part of it.

In France partnership ends of full right at the instant of the death of a partner, unless by contrary agreement this last regulation has been generally adopted. It is the same for that by which the profits distributed among partners are not to be returned to the partnership fund, whatever may happen afterward, unless there be fraud, and the provision is added, that a partner who brings in only his labor can not, in any case, return the dividends which he has received.

Almost every legislation except that of Great Britain recognizes the existence of three kinds of commercial partnerships. 1st. Ostensible partnerships (in collective name); 2d. Partnerships in *commandité*; 3d. Anonymous partnerships.

The Portuguese code specifies each kind of partnership, indicating their rules at some length. In effect, besides the partnership anonymous, dormant, or secret, and in collective name, that of capital and labor is made prominent; in this case the partner with capital alone is responsible beyond his investment, in consequence of which the law characterizes this association as irregular. Then come partnerships in participation, with limited or unlimited capital, called *Parceria*, either for an indivisible object, or for a determinate end; but in all cases it is necessary that it should refer to a commercial operation, and that there be at least one merchant either dormant or ostensible. There are in this code some regulations worthy of being noted; namely, that a contract which would free the provider of funds from all obligations, when he has a share in the profits, is null, but then he becomes an interested party, and not a partner. A contract is declared usurious which should allow to a lender of money the profits besides the interests, without subjecting him to the losses,

which is very proper and just; because the principle of equality ought to govern, above all, matters of partnership; consequently this last clause ought to be annulled if it existed. In general, a minor, even not a trader, may not be a partner; but he has power to make use of the privilege of restitution in case of loss. If, at his coming of age, he has not declared that he wishes to retire, he becomes responsible for all further acts of the partnership.

It is most essential in partnership in collective name that the partners should all be responsible in *solidum*. In this the Dutch code is equal in all points to the French code; but the former code contains a derogation from this rule surprising at first, because it says that a collective partner who has become *commanditaire* is not responsible in *solidum*. The reason of this extraordinary regulation is founded upon the usage which permits the continuation of ancient commercial houses, known under the names of their founders, although these have still their capital invested in them; true it is that third parties ought to have been acquainted with it by the liquidation of the preceding house, or by the publication of the dissolution.

In the Spanish code there is a regulation different from any other legislation in matter of constitution of anonymous partnerships, by subjecting the articles, not to the examination of the government, but of the tribunals of commerce. The Spanish code and that of Portugal prescribe a measure the same as that of the Code Napoleon, which consists in making interests to run in full right, on the investments of the partners, from the day in which they ought to be made. With regard to the nomination of managers of partnership, in France the law has no provision for it. In Würtemberg and in Spain, when the manager is nominated by the articles, it is allowed, should his action be injurious to the interests of the company, to add another member. In Russia it is prohibited to confer by the articles the management of the partnership on certain parties for all its duration and without a renewal.

All legislation is silent upon the interests of the capital invested by the shareholders. It is, in fact, clear that an investment of funds in a partnership is not an employment, but a sum bestowed for mere operations, and which can only allow to raise sums on the realized profits, either every year, or at the time when balance-sheets are drawn up according to law, or at any other time, periodical or not. But in Hungary the "*commanditaires*," improperly called partners, because they are then only considered as lenders of money, may stipulate for interests beyond the legal rate which the other partners ought to pay, even if they should suffer losses. It is the same in Prussia.

With regard to the emission of shares and their transference, the Hungarian code contains very important regulations. It says that all persons may buy shares, but it proscribes shares to the bearer—a regulation which was reproduced in the Russian code and in the Würtemberg code. It says also that no investment of capital can be made nor interests claimed before the constitution of the partnership, and that only when all shares are disposed of the shareholders may establish the articles. Lastly, there is the remarkable regulation, that when the majority of shareholders have voted for a change or modification in the articles, of a nature to alter the object of the partnership, the minority have power to retire.

The Russian code prescribes several very curious measures. The sale of shares, or promises of shares on credit, is prohibited. A portion of the profits must be taken to constitute a reserve fund; the unreclaimed dividend, after ten years, is united to the social fund, or may be divided among the other shareholders. Lastly, if the directors are divided in their deliberations, the dissenting minority may exact that mention be made of their opinion in the verbal process. The same code indicates the mode of terminating disputes:

between shareholders or directors they may, with their consent, be decided by the general meeting, or by arbitrators; when third parties are concerned, it stands always with the tribunal of arbitrament to decide as a forced jurisdiction. In France the same clause is equally precise. But various modern legislations inserted regulations against this mode; thus the code of Württemberg permits parties to derogate from it; the Hungarian code says that disputes among partners shall be brought before the Tribunal of Commerce; and if it regards bills of exchange, or in case of insolvency, they shall be adjudicated upon by the ordinary tribunals. The Lombardo-Venetian code does not reproduce the section of the French code, called *On Disputes among Partners*. The recent codes of Nassau and Sardinia do not contain any regulation on this matter. In England, when a reference is depending, made, or determined, it may be a bar; but the agreement of the parties does not oust either courts of law or equity, as the former will not allow their jurisdiction to be ousted by any private arrangement, and equity will not decree a specific performance thereof.

The law of merchants differs from the common law in the power of binding a partner by deed.

Lord Kenyon said, in *Harrison v. Jackson*, 7 S. R. 210: "The law on merchants is part of the law of the land, and in mercantile transactions it never was doubted but that one partner might bind the rest. But the power of binding each other by deed is now for the first time insisted on. A general partnership agreement, though under seal, does not authorize the partners to execute deeds for each other, unless a particular power be given for that purpose. Yet in common law a partner has power to bind his copartner by deed."

Although, in the words of Hobart, C. J., "The custom of merchants is part of the common law of the United Kingdom, of which the judges ought to take notice; and if any doubt arise to them about their custom, they may send for the merchants to know their custom, as they may send for the citizens to know their law;" yet, on the other hand, Lord Holt says, "We take notice of the laws of merchants that are general, not of those that are particular usages."—See *Westminster Review*, xx. 58; *American Quarterly Review*, xix. 48; *Hunt's Merchants' Magazine*, xxiv. 66, xxxiii. 457, xxxv. 720. See also LEONE LEVI's *Commercial Law of the World*, 4to. London, 1854; and KENT's *Commentaries*, vol. iii.

Partners of the Masts, the wood-work round the mast at the deck, to strengthen and support the deck against the pressure of the mast. The term is also applied to the similar supports round the capstan and pumps.

Partridge Wood, a variegated wood imported from Martinique; it is said to be the produce of the *Heisteria coccinea*.

Passengers, in *Commercial navigation*, are individuals conveyed for hire from one place to another on board ship. Passage ships are those peculiarly appropriated to the conveyance of passengers. Passage ships are generally placed under certain regulations; and the extent to which emigration is now carried renders it of the utmost importance that these regulations should be carefully compiled. The greater number of emigrants are in humble life: few among them know any thing of ships, or of the precautions necessary to insure a safe and comfortable voyage; they are also, for the most part, poor, and exceedingly anxious to economize, so that they seldom hesitate to embark in any ship, however unfit for the conveyance of passengers, or inadequately furnished with provisions, if it be cheap. Unprincipled masters and owners have not been slow to take advantage of this; and in order to prevent the frauds that would otherwise be practiced on the unwary, it has been found indispensable to lay down some general regulations as to the number of

passengers to be taken on board ships as compared with their tonnage, the quantity of water and provisions as compared with the passengers, etc. But this is no very easy task. If the limitations be too strict, that is, if comparatively few passengers may be carried, or if the stock of provisions to be put on board be either unnecessarily large or expensive, the cost of emigration is proportionally enhanced, and an artificial and serious impediment is thrown in the way of what should be made as easy as possible, consistent with security. But, on the other hand, if too many passengers be allowed, their health is liable to suffer; and should the supply of provisions be inadequate, or the quality bad, the most serious consequences may ensue.

In some respects passengers may be considered as a portion of the crew. They may be called on by the master or commander of the ship, in case of imminent danger either from tempest or enemies, to lend their assistance for the general safety; and in the event of their declining, may be punished for disobedience. This principle has been recognized in several cases; but as the authority arises out of the necessity of the case, it must be exercised strictly within the limits of that necessity.—*Boyce v. Badcliffe*, 1 Campbell, 58. A passenger is not, however, bound to remain on board the ship in the hour of danger, but may quit it if he have an opportunity; and he is not required to take upon himself any responsibility as to the conduct of the ship. If he incur any responsibility, and perform extraordinary services in relieving a vessel in distress, he is entitled to a corresponding reward. The goods of passengers contribute to general average.—ABBOTT on the Law of Shipping.

Passenger Act of the United States.—It is made the duty of the Secretary of State, by the second paragraph of the 18th section of the act approved 3d of March, 1855, to give notice, in the ports of Europe and elsewhere, of the provisions of the act to regulate the carriage of passengers in steamships and other vessels.

The special attention of United States consular officers is called to this act, and also to the instructions which have been issued by the Treasury Department in reference to it. It will be observed that, while this act prescribes spaces of certain clear superficial feet of deck to each passenger (other than cabin passengers), it moreover fixes a maximum, by restricting the number of such passengers allowed to be carried in any such vessel in the proportion of one to every two tons of said vessel's tonnage measurement, excluding children under the age of one year in the computation, and computing two children over one and under eight years of age as one passenger. It follows, that though a vessel might afford clear spaces of the dimensions indicated for a greater number of passengers than one to every two tons of her tonnage measurement, yet if the number shall exceed that allowed by her tonnage measurement the penalties imposed by the law would attach; or if her tonnage measurement should allow a greater number of passengers than according to the clear spaces prescribed by law she could carry, yet if the number shall exceed that allowed by the clear spaces prescribed by law the penalties imposed by the law would equally attach. In other words, the one rule, as to the number of passengers a vessel is entitled to carry, is a limitation upon the other. The tonnage of each vessel, according to custom-house measurement, must, therefore, be ascertained, as well as the measurement of the spaces allotted to passengers, in order to determine the number of passengers she is entitled to carry.

In order to determine the number of passengers a vessel is entitled to carry in accordance with the spaces prescribed by this act, the height between decks must be measured, not from the bottom edge of the carlines or deck beams, but from the under surface of the upper deck to the top floor below; and no space shall be con-

sidered available for passengers that has not, when measured in this manner, the height called for by the law, as the case may be; nor shall any space in the vessel of a less width than four feet be measured; provided, however, if the vessel shall, in accordance with the provisions of the first section of this act, carry any portion of her cargo, or any other article or articles, on any of the decks, cabins, or other places appropriated for the use of passengers, in lockers or inclosures prepared for the purpose, the height between decks shall be measured from the bottom edge of the carlines, or deck beams, to the upper surface of said lockers or inclosed spaces, which shall be deemed and taken to be the deck or platform from which measurement shall be made for all the purposes of this act, and the spaces occupied by said lockers or inclosed spaces shall be deducted from the spaces allowable for the use of passengers. For example: the spaces in the main and poop decks, or platforms, and in the deck houses, if any there be, will be $16 \times 6 = 96$ feet; lower deck, $18 \times 6 = 108$ feet; two-deck vessels, $14 \times 7\frac{1}{2} = 105$ feet. The encumbering by merchandise or stores, not the personal baggage of the passengers, except in lockers or inclosures prepared for the purpose, of any part of the space occupied by the passengers, will vitiate the whole space, unless the part so encumbered be separated from that so occupied by a substantial bulkhead. The deck or platform must be of a permanent nature, flush, and impervious to the water.

Passport, a warrant of protection and authority to travel, granted to persons moving from place to place by the competent officer. The word appears to be derived from the maritime usage of some Continental countries of giving similar authorities from the admiral of a naval station to vessels leaving harbors within his jurisdiction. As passports are not required in our own country, the only species known to our travelers is that of foreign passports, which, for traveling on the continent of Europe, are usually made out by the resident minister or consul of the country he intends first to visit, or by the State Department. They are subject to *visa*, or inspection, by the proper authorities at the place where the traveler disembarks, and also at other places where he may reach, according to the police regulations of each particular country, and on passing the frontiers of states. Austria is, we believe, the only European state which at this time requires absolutely the *visa* of an ambassador or minister of her own for travelers entering her domains by land. In France, and in many Continental countries, home passports are necessary for the native traveler. According to the letter of the French law (since 1796), a Frenchman can not pass the limits of the canton in which he is domiciled without a passport; but in practice it is not required within the extent of the department. Legally speaking, the strict formalities of an internal passport in France require the direction of a journey to be specified, and its exact execution attested by the *visas* and signatures of the police authorities at every place mentioned in it; and these laws are, from their severity, so incapable of complete execution, that it is a common saying that no man but a rogue is ever entirely *en règle* with respect to his passport, suspicious characters being usually the most particular in their attention to formalities, for fear of detention. A Frenchman traveling without a properly-authenticated passport is liable to arrest and detention for a period not exceeding a month. The fees fixed in France are two francs for a passport to travel at home, and ten to go abroad.

By the twenty-first section of the act of August 18, 1856, the Secretary of State of the United States is authorized to grant and issue passports, and cause passports to be granted, issued, and verified in foreign countries by such diplomatic or consular officers of the United States, and under such rules as the President shall designate and prescribe, for and on behalf of the United

States, and no other person shall grant, issue, or verify any such passport; nor shall any passport be granted or issued to or verified for any other persons than citizens of the United States; nor shall any charge be made for granting, issuing, or verifying any passport, except in a foreign country; and in any case the fee allowed therefor shall not exceed the sum of one dollar, nor shall any such charge be made for more than one such verification in any foreign country; and if any person acting or claiming to act in any office or capacity under the United States, or any of the States of the United States, who shall not be lawfully authorized so to do, shall grant, issue, or verify any passport, or other instrument in the nature of a passport, to or for any citizen of the United States, or to or for any person claiming to be or designated as such in such passport or verification; or if any consular officer who shall be authorized to grant, issue, or verify passports, shall knowingly and willingly grant, issue, or verify any such passport to or for any person not a citizen of the United States, the person so offending shall be deemed and taken to be guilty of a misdemeanor, and on conviction thereof shall be imprisoned not exceeding one year, or fined in a sum not to exceed five hundred dollars, or both; and may be charged, proceeded against, tried, convicted, and dealt with therefor in the district where he may be arrested or in custody. It is likewise made the duty of all persons who shall be authorized, pursuant to the provisions of the act, to grant, issue, or verify passports, to make return of the same to the Secretary of State; and such returns shall specify the names and all other particulars of the persons to whom the same shall be granted, issued, or verified, as embraced in such passport.

From the foregoing provisions of the act it will be seen that passports can only be issued by the Secretary of State, and such diplomatic and consular officers of the United States in foreign countries as he may expressly authorize, and they can be granted to citizens of the United States only. Passports will be granted by the Secretary of State, and by the diplomatic representatives of the United States in foreign countries, free of charge; but when issued by a consul general or consul, the fee of one dollar, as prescribed in these instructions, is to be collected in every case. As passports granted by the Secretary of State secure to the bearers facilities from foreign governments not accorded to those issued by diplomatic officers, consuls general, or consuls, it will always be to the interest of travelers to procure their passports before leaving the United States, and this course is earnestly recommended by the Department of State. In any country where there is a diplomatic representative of the United States, no consul general or consul is authorized to issue passports, except in the absence of such representative from the place of his legation. Whenever he may be so absent, authority is given to consuls general and consuls only to issue passports; but in all cases the said consuls general or consuls, as the case may be, will report to the Department of State the names of the persons to whom passports have been issued by them, together with the evidence of their being citizens of the United States, and a copy of the same report will be forwarded to the legation of the United States, if there be any in the country. In case there should be no diplomatic representative accredited to the country in which a consul general or consul may reside, then these officers are authorized to grant passports, having regard to the general instructions to consular officers in reference thereto; they will transmit, in all cases, to the Department of State the information in regard to citizenship required by this section.

Whenever a foreign government shall require the *visa* of a passport of any citizen of the United States, it shall be given by the consular officer of the United States at the place where it is demanded, and he shall, for each passport so *visé*, collect and account for the

fee prescribed in these instructions, noting on the passport that this has been done; and no charge shall thereafter be made by any officer of the United States for any *visa* of that passport in the same country. Passports are granted upon the ground of international courtesy, and as affording evidence to the diplomatic and other agents in foreign countries that the bearer thereof is a citizen of the United States, and entitled to full protection as such. A passport, in proper form, must contain a description of the bearer, with his signature; it must also request all whom it may concern to permit the bearer thereof, being a citizen of the United States, safely and freely to pass, and, in case of need, to give him all lawful aid and protection while so doing. It must be signed by the diplomatic representative, consul general, or consul, and sealed with the seal of the legation or consulate. Consuls general and consuls are expressly instructed that when an application is made for a passport by a native citizen of the United States, before granting it, the applicant must file in the consulate an affidavit stating that fact, and also his age and place of birth; this must be signed and sworn to by himself and one other citizen of the United States named therein, to whom he is personally known, and to the best of whose knowledge and belief the declaration made by him is true. If the applicant be a naturalized citizen, a passport can only be granted upon his exhibiting a certificate of naturalization, or a certified copy thereof; an authenticated copy of which must be transmitted by the consul general or consul to the Department of State. When the applicant is accompanied by his wife, children, or servants, or by females under his protection, it will be sufficient to state the names and ages of such persons and their relationship to the applicant.

UNITED STATES CONSULAR PASSPORT.

CONSULATE OF THE UNITED STATES OF AMERICA.

To all to whom these presents shall come, greeting:

Age, years.	I, the undersigned, consul of the United
Stature,	States of America for ———, and the de-
Forehead,	pendencies thereof, hereby request all
Eyes,	whom it may concern, to permit safely and
Nose,	freely to pass, ———, a citizen of the
Mouth,	United States, and in case of need to give
Chin,	him all lawful aid and protection.
Hair,	Given under my hand and the seal of the
Complexion,	consulate, at ———, this ——— day
Face,	of ———, A.D. 18—, and in the
	[SEAL.] year of the independence of the
	United States ———.

Paste (Fr. *pâte*). In Gem Sculpture, a preparation of glass, calcined crystal, lead, and other ingredients, for imitating gems. This art was well known to the ancients, and, after being long lost, was restored, at the end of the fifteenth century, by a Milanese painter. Some modern artists have succeeded in obtaining a composition possessing a hard, fine, and brilliant lustre or appearance; but *pastes*, or mock diamonds, as they are called, depend most for brilliancy on the art displayed in setting the foil or tinsel behind them. Several recipes have been given by M. Fontanien; but the most useful, and that generally employed for the production of artificial diamonds, is the following: Take of litharge 20 parts, of silex 12, of nitre 4, of borax 4, and of white arsenic 2 parts. These ingredients are to be well mixed together in a crucible and melted; the fused metal is thrown into water; and should any of the lead employed be reduced to the metallic state, it becomes separated by this process, and the glass is remelted for use. For the finer kinds, rock crystal is used instead of flint or sand, as it occurs in a much purer state; i. e., more free from the admixture of metallic oxyds, which give to vitreous compounds their different colors. In place of the above,

Loyael recommends the following ingredients to form a compound having the same specific gravity as the Oriental diamond, and on this account considered superior, as it more nearly approaches the gem with regard to its refractive and dispersive powers; but, like the former, it requires to be kept for some two or three days in a fused state, in order to expel the superabundant alkali and to perfect the refining. A moderate degree of heat fuses it. The following is its composition: Take of white sand purified by being washed, first in muriatic acid and afterward in pure water until all traces of acid are removed, 100 parts; red oxyd of lead (minium) 150 parts; calcined potash 30 to 35 parts; calcined borax 10; and oxyd of arsenic 1 part.—See the *Polytechnic Journal* for July, 1841. The term paste is also applied to the earthy mixture for pottery and porcelain; also to dough, and to the solution of starch or wheat flour, made by first mixing it with a proper portion of cold water, and then adding boiling water under constant stirring, so as to form an even solution. Alum is often added to paste to strengthen it.—BRANDE'S Dictionary.

Pastel (Lat. *pastillus*). In painting, a crayon formed with any color and gum water, for painting on paper or parchment. The great defect of this mode of painting is its want of durability.

Patents. A patent, according to the definition of Mr. Philips, is a grant by the State of the exclusive privilege of making, using, and vending, and authorizing others to make, use, and vend, an invention.

The first act of Congress on this subject was passed April 10th, 1790, and it authorized the Secretary of State, the Secretary of War, and the Attorney General, or any two of them, to grant patents for such new inventions and discoveries as they should deem sufficiently useful and important. That act extended equally to aliens, and the board exercised the power of refusing patents for want of novelty or utility. This act was repealed, and a new act passed on the 21st February, 1793. It confined patents to the citizens of the United States, and they were to be granted by the Secretary of State, subject to the revision of the Attorney General. The act gave no power to the Secretary of State to refuse a patent for want of novelty or usefulness, and the granting of the patent became a mere ministerial duty. The privilege of suing out a patent was, by the act of 17th April, 1800, extended to aliens of two years' residence in the United States. The act of July 13th, 1832, only required the alien to be a resident at the time of the application, and to have declared his intention, according to law, to become a citizen.

But as every person was entitled to take out a patent, on complying with the prescribed terms, without any material inquiry, at least at the Patent Office, respecting the usefulness and importance of the invention or improvement, a great many worthless and fraudulent patents were issued, and the value of the privilege was degraded, and in a great degree destroyed. It became necessary to give a new organization to the Patent Office, and to elevate its character, and confer upon it more efficient power. This was done by the act of Congress of July 4th, 1836, which repealed all former laws on the subject, and re-enacted the patent system with essential improvements. A Patent Office is now attached to the Interior Department, and a commissioner of patents appointed. Applications for patents are to be made in writing to the commissioner, by any persons having discovered or invented any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement on any art, machine, manufacture, or composition of matter, not known or used by others before his discovery or invention thereof, and not at the time of his application for a patent in public use or on sale, with his consent or allowance, as the inventor or discoverer. The applicant must deliver a written description of his invention

or discovery, and of the manner and process of making, constructing, using and compounding the same, in full, clear, and exact terms, avoiding unnecessary prolixity, so as to enable any person skilled in the art or science to which it appertains, or is most nearly connected, to make, construct, compound, and use the same; and he must, in the case of a machine, fully explain the principle and the application of it, by which it may be distinguished from other inventions; and he must particularly specify the part, improvement, or combination which he claims as his own invention or discovery. He must accompany the same with drawings and written references, where the nature of the case admits of drawings or specimens of ingredients, and of the composition of matter sufficient in quantity for the purpose of experiment, where the invention or discovery is of a composition of matter. He must likewise furnish a model of his invention, in cases which admit of representation by model. The applicant also must make oath or affirmation that he believes he is the original and first inventor or discoverer of the art, machine, composition, or improvement for which he solicits a patent, and that he does not know or believe that the same was ever before known or used, and he must further state of what country he is a citizen.

If the applicant be a citizen, or an alien of one year's residence, he is to pay to the Treasury of the United States \$30; and if a British subject, \$500; and all other applicants, \$300. The original and true inventor is not to be deprived of the right to a patent for his invention, by reason of his having previously taken out letters patent therefor in a foreign country, and the same having been published at any time within six months next preceding the filing of his specification and drawing. The executors and administrators of persons dying before a patent is taken out, may apply and take it out in trust for the heirs or devisees, on due compliance with the terms of the statute. Patents are assignable, and may be granted in whole or in part by writing, to be recorded in the Patent Office. If invalid by reason of defective specifications, or by claiming too much, the patent may be surrendered, and a new patent taken out for the unexpired period, provided the error did not arise from any fraudulent intention. If the patentee be an alien, he forfeits his exclusive right, if he fails for eighteen months from the date of the patent to continue on sale to the public on reasonable terms the invention or discovery covered by the patent. The patentee does not lose his patent if it satisfactorily appears to the court, that at the time of his application he believed himself to be the first inventor or discoverer of the thing patented, though the invention or discovery, or any part thereof, had been before known or used in a foreign country; provided it does not appear that the same, or any substantial part thereof, had before been patented or described in any printed publication.

These are the principal existing statute provisions on the subject, and though the act of Congress of 1836 has made considerable alterations in the pre-existing laws respecting the organization of the Patent Office, and the limitations on the granting of patents, yet the essential and established doctrines concerning patents heretofore declared in the decisions of the courts remain unaffected. The act of 1793 declared that simply changing the form or the proportions of any machine or composition of matter in any degree was not a discovery. And also, that the person who had discovered an improvement in the principle of any machine, or in the process of any composition of matter, might obtain a patent for such improvement, but that he could not thereby make, use, or vend the original discovery, nor could the first inventor use the improvement. These declaratory provisions are omitted in the law of 1836, and I presume the construction was considered to be necessarily the same without the provision. In an age distinguished for an active and ar-

dent spirit of improvement in the arts of agriculture and manufactures, and in the machinery of every kind applied to their use, the doctrine of patent rights has attracted much discussion, and become a subject of deep interest both here and in Europe.—*KENT'S Commentaries*, vol. ii. p. 438; *DUNLAP'S Digest Laus U. S.*

Patras, or **Patrasso**, a sea-port in the northwest corner of the Morea, near the entrance of the Gulf of Lepanto, lat. 38° 14' 25" N., long. 21° 46' 20" E. Population variously estimated from 7000 to 8000. The port lies a little to the northward of the town; but the part fronting it is unsafe, and exposed to heavy seas, particularly in winter. Vessels, therefore, go a little farther up the gulf, where there is a mole or quay, and where they can lie close to the wharf. Patras has a more extensive trade than any other port of Greece. The principal exports are currants, oil, valonia, wine, raw silk, raw cotton, wool, skins, wax, etc. Of these, currants are by far the most important. The fruit is larger, and freer from sand and gravel, than that of the Ionian Islands. They are shipped in casks of various sizes; but as the weight of the cask is included in that of the fruit, it is said to be, for the most part, heavier and stronger than necessary. Morea currants are preferred in most countries, except England; but there the currants of Zante are held in equal, or perhaps greater, estimation. The export of currants from Patras may average from 70,000 to 80,000 cwts. a year; but the produce of the crop varies extremely in different seasons. Latterly the culture of currants in the Morea has been very greatly extended. Owing to the increase of their quantity, their price has been much reduced. But their cultivation would notwithstanding be extremely profitable were it not for the extraordinary risks by which it is attended. It is seldom, indeed, that the entire crop can be housed without serious damage; and very frequently it is all but entirely lost. This was the case with the crop of 1852, the loss of which occasioned much distress. The crops of oil, the next great article of export from Patras, are, if possible, still more fluctuating than those of currants. The imports at Patras, as at the other Greek ports, consist principally of sugar, coffee, and other colonial products; plain and printed cotton stuffs, woolen goods, salted fish, iron, tin plates, hardware, coal, cordage, hemp, deals, etc. Imported articles are brought principally from the Ionian Islands, Malta, Venice, Leghorn, Marseilles, and Trieste; but, from the want of authentic details, it is quite impossible to form any accurate estimate of their amount either as respects Patras or any other Greek port.

Commerce.—The Greeks have particularly distinguished themselves by the spirit and success with which they have engaged in naval and mercantile enterprises. Their commerce, next to their freedom, was the grand source of the prosperity of Athens, Corinth, and other Greek cities of antiquity. And in this respect the modern Greeks have been no unsuccessful imitators of their illustrious progenitors. The great articles of export from Greece consist of currants, silk, figs, wool, olive oil, valonia, wine, sponge, wax, tobacco, etc.; the principal imports being manufactured cotton and woolen goods, corn, with a great variety of subordinate articles, principally from England, but partly also from France and Germany. The mercantile navy of Greece was estimated in 1850 at 4000 vessels, of the aggregate burden of 150,000 tons, employing about 30,000 seamen. The Greeks have, in fact, attained to the distinction of being the carriers, factors, and traders of the Levant.

The advantage resulting to Greece from her being the seat of extensive trade is not so great as might have been anticipated. The import and export trade of the country is subjected to many troublesome regulations; there are no roads, which, however, are less wanted here than in most other countries. Manufactures on a large scale can not be said to exist, the bulk

of the population, but little removed from barbarism, using only those made at home; agriculture is also in the most backward condition, and is almost wholly carried on under the *metayer* system. Still, however, some improvements are taking place, especially in the islands; and it is probable that the progress toward a better state of things will be gradually accelerated. It is deeply to be regretted that Candia, or Crete, was not either added to the new kingdom of Greece, or made independent. We can not help considering it as disgraceful to the Christian nations of Europe, that this famous island, where European civilization first struck its roots, should be consigned to the barbarians by whom it is now laid waste. It is as well entitled to the favorable consideration of England, France, and Russia, as any part of Continental Greece; and we hope that measures may yet be devised for rescuing it from the atrocious despotism by which it has been so long weighed down.—See GREECE. For Commerce, etc., of Modern Greece, see *Living Age*, ii. 557; NILES's *Register*, xxv. 342 (DANIEL WEBSTER's *Speech*); HUNT's *Merchants' Magazine*, vii. 109; DE BOW's *Review*, xlii. 134; *Democratic Review*, viii. 204 (GEORGE SUMNER).

Patterns are specimens or samples of commodities, transmitted by manufacturers to their correspondents, or carried from town to town by travelers, in search of orders.

Pawnbrokers and Pawnbroking. A pawnbroker is a species of banker, who advances money, at a certain rate of interest, upon security of goods deposited in his hands; having power to sell the goods, if the principal sum and the interest thereon be not paid within a specified time. The origin of borrowing money by means of pledges deposited with lenders is referred, as a regular trade, to Perousa, in Italy, about A.D. 1458; and soon afterward in England. The business of pawnbrokers was regulated 30 Geo. II., 1756. Licenses were issued 24 Geo. III., 1783. In London there are 334 pawnbrokers; and in England, exclusively of London, 1127.

Advantages and Disadvantages of Pawnbroking.—The practice of impledging or pawning goods, in order to raise loans, is one that must necessarily always exist in civilized societies, and is in many cases productive of advantage to the parties. But it is a practice that is extremely liable to abuse. By far the largest proportion of the *bona fide* borrowers of money on pawn consist of the lowest and most indigent classes; and were the lenders not subjected to any species of regulation, advantage might be taken (as, indeed, it is frequently taken, in despite of every precaution) of their necessities, to subject them to the most grievous extortion. But, besides those whose wants compel them to resort to pawnbrokers, there is another class, who have recourse to them in order to get rid of the property they have unlawfully acquired. Not only, therefore, are pawnbrokers instrumental in relieving the pressing and urgent necessities of the poor, but they may also, even without intending it, become the most efficient allies of thieves and swindlers, by affording them ready and convenient outlets for the disposal of their ill-gotten gains. The policy of giving legislative protection to a business so liable to abuse has been doubted by many. But though it were suppressed by law, it would always really exist. An individual possessed of property which he may neither be able nor willing to dispose of, may be reduced to a state of extreme difficulty; and in such case, what can be more convenient or advantageous for him than to get a loan upon a deposit of such property, under condition that if he repay the loan and the interest upon it within a certain period, the property will be returned? It is said, indeed, that the facilities of raising money in this way foster habits of impudence; that the first resort for aid to a pawnbroker almost always leads to a second; and that it is impossible so to regulate the business as to prevent

the ignorant and the necessitous from being plundered. That this statement, though exaggerated, is to a certain extent true, no one can deny. On the other hand, however, the capacity of obtaining supplies on deposits of goods, by affording the means of meeting pressing exigencies, in so far tends to prevent crime, and to promote the security of property; and it would seem as if the desire to redeem property in pawn would be one of the most powerful motives to industry and economy. At the same time, too, it must be borne in mind that it is not possible, do what you will, to prevent those who are poor and uninstructed from borrowing; and that they must in all cases obtain loans at a great sacrifice, and be liable to be imposed upon. But the fair presumption is, that there is less chance of any improper advantage being taken of them by a licensed pawnbroker than by a private and irresponsible individual. Although, however, the business had all the inconveniences, without any portion whatever of the good which really belongs to it, it would be to no purpose to attempt its suppression. It is visionary to imagine that those who have property will submit to be reduced to the extremity of want, without endeavoring to raise money upon it. Any attempt to put down pawnbroking would merely drive respectable persons from the trade, and throw it entirely into the hands of those who have neither property nor character to lose. And hence the object of a wise Legislature ought not to be to abolish what must always exist, but to endeavor, so far at least as is possible, to free it from abuse, by enacting such regulations as may appear to be best calculated to prevent the ignorant and the unwary from becoming the prey of swindlers, and to facilitate the discovery of stolen property.

Obligations under which Pawnbrokers should be placed.—For this purpose it seems indispensable that the interest charged by pawnbrokers should be limited; that they should be obliged to give a receipt for the articles pledged, and to retain them for a reasonable time before selling them; that the sale, when it does take place, should be by public auction, or in such a way as may give the articles the best chance for being sold at a fair price; and that the excess of price, if there be any, after deducting the amount advanced, and the interest and expenses of sale, should be paid over to the original owner of the goods. To prevent pawnbrokers from becoming the receivers of stolen goods, they should be liable to penalties for making advances to any individual unable to give a satisfactory account of the mode in which he became possessed of the property he is desirous to pawn; the officers of police should at all times have free access to their premises; and they should be obliged carefully to describe and advertise the property they offer for sale.

Law as to Pawnbrokers.—It may appear singular that pawnbrokers should hardly have been named in any legislative enactment till after the middle of last century. It was enacted by the 30 Geo. II. that a duplicate or receipt should be given for goods pawned, and that such as were pawned for any sum less than £10 might be recovered any time within two years on payment of the principal and interest; but the rate of interest was not fixed.

Of the pledge of Mortgage and Chattels.—There is a material distinction to be noticed between a pledge and a mortgage. A pledge, or pawn, is a deposit of goods redeemable on certain terms, and either with or without a fixed period of redemption. Delivery accompanies a pledge, and is essential to its validity. The general property does not pass, as in the case of a mortgage, and the pawnee has only a special property. If no time of redemption be fixed by the contract, the pawnor may redeem at any time; and though a day of payment be fixed, he may redeem after the day. He has his whole lifetime to redeem, provided the pawnee does not call upon him to redeem, as he has a right to do at any time, in his discretion, if no time for redemption

be fixed; and if no such call be made, the representatives of the pawner may redeem after his death. As early as the time of Glauville, these just and plain principles of the law of pledges were essentially recognized, and it was declared, that if the pledge was not redeemed by the time appointed, the creditor might have recourse to the law, and compel the pawner to redeem by a given day, or be forever foreclosed and barred of his right. And if no time of redemption was fixed, the creditor might call upon the debtor at any time, by legal process, to redeem or lose his pledge. The distinction between a pawn and mortgage of chattels is equally well settled in the English and American law; and a mortgage of goods differs from a pledge and pawn in this, that the former is a conveyance of the title upon condition, and it becomes an absolute interest at law, if not redeemed by a given time, and it may be valid in certain cases without actual delivery. According to the civil law, a pledge could not be sold without judicial sanction, unless there was a special agreement to this effect; and this is, doubtless, the law at this day in most parts of Europe. The French *Civil Code* has adopted the law of Constantine, by which even an agreement at the time of the original contract of loan, that if the debtor did not pay at the day, the pledge should be absolutely forfeited, and become the property of the creditor, was declared to be void. While on this subject of pledges, it may be proper further to observe, that the pawnee, by bill in chancery, may bar the debtor's right of redemption and have the chattels sold. This has been done frequently in the case of stock bonds, plate, or other personal property pledged for the payment of debt. But without any bill to redeem, the creditor, on a pledge or mortgage of chattels, may sell at auction, on giving reasonable opportunity to the debtor to redeem, and apprising him of the time and place of sale; and this is the more convenient and usual practice. While the debtor's right in the pledge remains unextinguished, his interest is liable to be sold on execution; and the purchaser, like any other purchaser or assignee of the interest of the pawner, succeeds to all his rights, and becomes entitled to redeem.—See KENT's *Commentaries*, vol. iv.

Italy, France, &c.—The practice of advancing money to the poor, either with or without interest, seems to have been occasionally followed in antiquity.—BECKMANN, vol. iii. But the first public establishments of this sort were founded in Italy, under the name of *Monti di Pietà*, in the 14th and 15th centuries. As it was soon found to be impossible to procure the means of supporting such establishments from voluntary contributions, a bull for allowing interest to be charged upon the loans made to the poor was issued by Leo X. in 1521. These establishments, though differing in many respects, have universally for their object to protect the needy from the risk of being plundered by the irresponsible individuals to whom their necessities might oblige them to resort, by accommodating them with loans on comparatively reasonable terms. And though their practice has not, in all instances, corresponded with the professions they have made, there seems no reason to doubt that they have been, speaking generally, of essential service to the poor. From Italy these establishments have gradually spread over the Continent. The *Mont de Piété*, in Paris, was established by a royal ordinance in 1777; and after being destroyed by the Revolution, was again opened in 1797. In 1804 it obtained a monopoly of the business of pawnbroking in the capital. Loans are made by this establishment upon deposits of such goods as can be preserved, to the amount of two-thirds of the estimated value of all goods other than gold and silver, and to four-fifths of the value of the latter. No loan is for less than 3 francs. The advances are made for a year, but the borrower may renew the engagement. Interest is fixed at the rate of one per cent. per month.

The *Mont de Piété* has generally in deposit from

600,000 to 650,000 articles, worth from twelve million to thirteen million francs. The expense of management amounts to from 60 to 65 centimes for each article; so that a loan of 3 francs never defrays the expenses it occasions, and the profits are wholly derived from those that exceed 5 francs. At an average the profits amount to about 280,000 francs, of which only about 155,000 are derived from loans upon deposit, about 125,000 being the produce of other funds at the disposal of the company. In some respects, particularly the lowness of interest upon small loans, and the greater vigilance exercised with respect to the reception of stolen goods, the *Mont de Piété* has an advantage over the pawnbroking establishments in this country. It may be doubted, however, whether it is, on the whole, so well fitted to attain its objects. The limitation of the loans to 3 francs would be felt to be a serious grievance here, and it can hardly be otherwise in France; nor is it to be supposed that the servants of a great public establishment will be so ready to assist poor persons, having none but inferior articles to offer in security, as private individuals anxious to get business. And such, in point of fact, is found to be the case, not in Paris only, but in all those parts of the Continent where the business of pawnbroking is confined to a few establishments. And hence, though the question be not free from difficulty, it would seem that, were the modifications already suggested adopted, our system would be the best of any. For further information with respect to this curious and interesting subject, the reader is referred to the *Traité de la Bienfaisance Publique* of Degerando, iii. 1-55; besides giving a succinct historical notice of *Monts de Piété*, the learned author has discussed most part of the knotty questions connected with the proper organization of these establishments, and with their influence on society, with equal sagacity and ability.—See *Bankers' Magazine*, New York, August, 1850, p. 170; August, 1852, p. 124 (Sir F. HEAD), *Standard Lib. Cy.* London, 1849.

Peach-tree (*Amygdalus persica*). It is not certain in what part of the globe the peach-tree was originally produced; for although we have early accounts of its being brought to Europe from Persia, it does not follow from thence that it was one of the natural productions of that country. Pliny relates that it had been stated to have possessed venomous qualities, and that its fruit was sent into Egypt by the kings of Persia, by way of revenge, to poison the natives; but he treats this story as a mere fable, and considers it the most harmless fruit in the world; that it had the most juicy, and the least smell of any fruit, and yet caused thirst to those who ate of it. He expressly states that it was imported by the Romans from Persia; but whether it was indigenous to that country, or sent thither from a region still nearer to the equator, we have no information. He adds that it was not long since peaches were known in Rome, and that there was great difficulty in rearing them. He also informs us that this tree was brought from Egypt to the Isle of Rhodes, where it could never be made to produce fruit; and from thence to Italy. He says, moreover, that it was not a common fruit either in Greece or Natolia. No mention, however, is made of it by Cato. Powhall, in his *Roman Provinces*, makes it a Phœcean importation to Marseilles; and evidently it was cultivated in France at an early period, as Columella, in his account of this fruit, says:

"Those of small size to ripen make great haste;
Such as great Gaul bestows, observes due time
And season, not too early, nor too late."

The peach is said to have been first cultivated in Britain about the middle of the 16th century. Gerard describes several varieties of it as growing in his garden, in 1597. Tusser mentions it in his list of fruits in 1577; and in all probability it was introduced when the Romans had possession of that country.

The peach was introduced into North America by

the first European settlers, probably toward the close of the 16th or early in the 17th century, where it is cultivated in extensive plantations, which often grow with such luxuriance as to resemble forests of other trees. In New Jersey, Pennsylvania, Delaware, Maryland, Virginia, and several other States, much attention is paid to its culture, and the fruit is of an excellent quality. It is no uncommon circumstance for a planter to possess a peach orchard containing one thousand or more of standard trees. It is only in the Middle States of the Union where this fruit arrives at the greatest perfection. In favorable seasons, it matures in the open air as far north as Maine, New Hampshire, Vermont, and the Falls of Niagara; but its pulp is not so delicious as when grown some degrees farther south; it is also trained against walls at Montreal and Toronto, in Canada, where, in some seasons, fruit of a fine quality is obtained. In the Carolinas, Georgia, and Florida, the trees make much foliage and wood; still, if well cultivated and properly pruned, the fruit grows to a large size, and is juicy and well flavored. On the Mississippi, particularly in Louisiana, which lies in the same latitude as that part of Asia where this species is indigenous, it grows spontaneously, but is regarded as of foreign origin, having been introduced from Spain before that river was explored by the French. In the vicinity of Boston, Salem, New York, Philadelphia, and other populous cities of the United States, the peach is reared against walls and in hot-houses by numerous opulent citizens, and fruit of a large size and fine quality is produced. In some other parts of the American continent it also readily grows, and in great abundance. Sir Francis Head, in his *Rough Notes*, speaks in raptures of the beauty and luxuriance of this fruit, which was scattered over the corn-fields in the neighborhood of Mendoza, on the east side of the Andes; and the same traveler noticed dried peaches used as an article of food on the more elevated parts of those mountains, to which they must have been carried from the plains below. On the banks of Rio de la Plata, from Montevideo to Buenos Ayres, we have seen peach-trees growing spontaneously in the greatest perfection, and in such abundance as to form a considerable portion of the fuel of the provinces in which they grew. The fruit there is of a fine quality, large quantities of which are annually dried for domestic use, and the chief part of the remainder is consumed by cattle, or is suffered to decay upon the ground.

The wood of the peach-tree is hard, compact, of a roseate hue, and is susceptible of a fine polish; but owing to its inferior size and comparative scarcity, it is but little used in the arts, or for fuel, except in countries where other kinds of wood are rare. When obtained, however, of suitable dimensions, it may be employed for similar purposes as that of the almond. A color may also be extracted from it called *rose-pink*. Its leaves yield, by distillation, a volatile oil of a yellow color, containing hydrocyanic acid. Its bark, blossoms, and kernels of the fruit, also possess the same poisonous property. From the quantity of gum and sugar contained in the delicious pulp, the peach is nutritious, and is employed as a dessert, both fresh and preserved. From the malic acid contained in its juice, it is slightly refrigerant, and if eaten in moderate quantities it is generally considered as wholesome; but if taken too freely it is liable to disorder the bowels. When stewed with sugar, it may be given as a mild relaxative to convalescents. The kernels may be used for the same purpose as those of the bitter almond. The leaves are sometimes employed by the cook, the liquorist, and the confectioner, for flavoring, and they have also been substituted for Chinese tea; but, as fatal consequences have sometimes followed these uses, they should be looked upon with precaution. The preservation of peaches, plums, cherries, apricots, and other kinds of fruit in sirup occupies a prominent rank in the industry and commerce of France and of Ma-

jorca, and doubtless could be profitably carried on in those parts of the United States where these fruits are cultivated in abundance. To those who are desirous of entering into the business on an extensive scale, we would recommend the *Nouveau Manuel du Limonadier, du Glacier, du Chocolatier, et du Confiseur*, par MM. Cardelli, Lionnet-Clémandot, et Julia de Fontenelle, published at Paris in 1838; or, what would be still better, the employment of an intelligent *confiseur* who is practically acquainted with all its manipulations.—BROWNE'S *Trees of America*.

Peak, a name given to the upper corner of those sails which are extended by a gaff, or by a yard which crosses the mast obliquely, as the mizzen-yard of a ship, the main-yard of a bylander, etc. The upper extremity of these yards and gaffs is also denominated the *peak*.

Pear-tree (*Pyrus Communis*). The common pear-tree is indigenous to Europe, Western Asia, the Himalayas, and to China; but not to Africa nor America. It is found wild in most of the counties of Britain, as far north as Forfarshire; on the continent of Europe, from Sweden to the Mediterranean; and in Asia, as far east as China and Japan. It is always found on a dry soil, and more frequently on plains than on hills or mountains; and solitary, or in small groups, rather than in woods and forests. The varieties cultivated for their fruit succeed both in the temperate and transition zones of the two hemispheres, and it has been remarked that this tree, as well as the apple and the cherry, will grow in the open air wherever the oak will thrive.

The wood of the common pear-tree is heavy, strong, compact, of a fine grain, and slightly tinged with red. In common with that of all the Rosaceæ, it is liable to have its natural color changed by steeping in water, which, therefore, ought to be avoided when intended for particular purposes in the arts. When green, it weighs nearly eighty pounds to a cubic foot, and from forty-nine to fifty-three pounds when dry. According to Du Hamel, it is, next to the true service (*Pyrus sorbus*), the best wood that can be employed in wood-engraving, for which purpose, however, it is far inferior to that of the box. Yet it is allowed to be very hard and homogeneous, easy to cut, and, when perfectly dry, is not liable either to crack or warp. For the coarser kinds of engraving, such as large plans or diagrams, show-bills, etc., it serves a very good purpose. When it can be obtained, in Europe, it is much used by turners and pattern-makers; also for joiners' tools; and, as it can readily be stained, it is sometimes made into various articles, dyed black, in imitation of ebony. As fuel, the wood of this tree is excellent, producing a vivid and durable flame, accompanied by an intense heat. According to Withering, the leaves afford a yellow dye, and may be employed to impart a greenish shade to blue cloths. But the most important uses of the pear-tree are those which arise from its fruit. When ripe, it is employed at the table as a dessert, either raw, stewed, or preserved in sirup, and occasionally it is used in tarts. In most of the countries where it grows this fruit is very generally dried in ovens, or in the sun, in which state, when stewed, it is excellent, either as a substitute for puddings and pies, or as forming part of the dessert.

Another purpose to which the pear is applied is for making perry. It is extensively cultivated for this object in various parts of Britain, France, and Germany, where the trees are sometimes planted in rows eighteen or twenty yards apart, in order to admit a free access of light and air. Perry is made in the same manner as cider. The pears should be gathered before they begin to fall, and should be ground as soon after as possible. Should the perry not be sufficiently clear, when racked off, it may be fined in the usual manner of clarifying cider, by isinglass, in the proportion of about half an ounce to a barrel. The kinds of pears

used for making this liquor in Herefordshire are such as have an austere juice, as the "Squash," the "Old-field," the "Barland," the "Huff-cap," the "Sack," the "Red," and the "Longland" varieties. Pears were considered by the Romans as an antidote to the effect of eating poisonous mushrooms; and up to the present time perry is said to be the best remedy that can be employed for the same purpose. In Britain and France an agreeable wine is made from a mixture of crab-apples and pears, which in the latter country is called *piquette*. Pears, in general, produce flatulency, and consequently are unfit for weak stomachs; but when they are quite ripe, and contain a sweet juice, they seldom prove noxious, unless eaten to excess. Pears that are to be kept for winter use should hang as long on the trees as the state of the weather will admit. They should then be kept in heaps, in an open, dry situation, for about ten days, then wiped with a dry woollen cloth, and, lastly, packed up close from the air and moisture. But to keep the fruit in its greatest perfection, small earthen jars may be selected about the size of the pear, which should be packed separately, in clean oat chaff or wheaten bran, then tied down with oiled paper or skin, and cemented tight with wax or pitch. These jars should then be packed in a cask, chest, or some other secure place, with their bottoms upward, where they should remain until required for use.—BROWNE'S *Trees of America*.

Pearl-ash. See POTASH.

Pearls (Du. *Paarlen*; Fr. *Perles*; Ger. *Perlen*; It. *Perle*; Lat. *Margaritæ*; Russ. *Shemptschug, Perli*; Sp. *Perlas*; Arab. *Looloo*; Cyng. *Mootoo*; Hind. *Mootie*), are well-known globular concretions found in several species of shell-fish, but particularly the mother-of-pearl oyster (*Concha margaritifera*, Linn.). Pearls should be chosen round, of a bright, translucent, silvery whiteness, free from stains and roughness. Having these qualities, the largest are of course the most valuable. The larger ones have frequently the shape of a pear; and when these are otherwise perfect, they are in great demand for ear-rings. Ceylon pearls are most esteemed in England. The formation of the pearl has embarrassed both ancient and modern naturalists to explain, and has given occasion to a number of vain and absurd hypotheses. M. Réaumur, in 1717, alleged that pearls are formed like other stones in animals. An ancient pearl was valued by Pliny at £80,000 sterling. One which was brought, in 1574, to Philip II., of the size of a pigeon's egg, was valued at 14,400 ducats, equal to £13,996. A pearl spoken of by Boetius, named the *Incomparable*, weighed thirty carats, equal to five pennyweights, and was about the size of a muscadine pear. The pearl mentioned by Tavernier as being in possession of the Emperor of Persia was purchased of an Arab in 1633, and is valued at a sum equal to £110,400.—HAYDN.

Value of Pearls.—Pearls were in the highest possible estimation in ancient Rome, and bore an enormous price. *Principium culmenque omnium rerum pretii, margaritæ tenent.*—PLINY, *Hist. Nat.* Their price in modern times has very much declined; partly, no doubt, from changes of manners and fashions, but more probably from the admirable imitations of pearls that may be obtained at a very low price. According to Mr. Milburn, a handsome necklace of Ceylon pearls, smaller than a large pea, costs from £170 to £800; but one of pearls about the size of peppercorns may be had for £15. The pearls in the former sell at a guinea each, and those in the latter at about 1s. 6d. When the pearls dwindle to the size of small shot, they are denominated *seed pearls*, and are of little value. They are mostly sent to China. One of the most remarkable pearls of which we have any authentic account was bought by Tavernier at Catifa, in Arabia, a fishery famous in the days of Pliny, for the enormous sum of £110,000! It is pear-shaped, regular, and without blemish. The diameter is .63 inch at the largest part,

and the length from two to three inches. Much difference of opinion has existed among naturalists with respect to the production of pearls in the oyster; but it seems now to be generally believed that it is the result of disease, and is formed in the same manner as bezoar (see BEZOAR), pearls, like it, consisting of successive coats spread with perfect regularity round a foreign nucleus. In fact, the Chinese throw into a species of shell-fish (*mytilus cygneus*, or swan muscle), when it opens, five or six very minute mother-of-pearl beads strung on a thread; and in the course of a year they are found covered with a pearly crust, which perfectly resembles the real pearl.—MILBURN'S *Oriental Commerce*; AINSLIE'S *Materia Indica*.

Pearl Fisheries.—The pearl oyster is fished in various parts of the world, particularly on the west coast of Ceylon; at Tuticoreen, in the province of Tinnevelly, on the coast of Coromandel; at the Bahrein Islands, in the Gulf of Persia; at the Sooloo Islands; off the coast of Algiers; off St. Margarita; or Pearl Islands, in the West Indies, and other places on the coast of Colombia; and in the Bay of Panama, in the South Sea. Pearls have sometimes been found on the Scotch coast, and in various other places. The pearl fishery of Tuticoreen is monopolized by the East India Company, and that of Ceylon by government. But these monopolies are of no value; as in neither case does the sum for which the fishery is let equal the expenses incurred in guarding, surveying, and managing the banks. It is, therefore, sufficiently obvious that this system ought to be abolished, and every one allowed to fish on paying a moderate license duty. The fear of exhausting the banks is quite ludicrous. The fishery would be abandoned as unprofitable long before the breed of oysters had been injuriously diminished; and in a few years it would be as productive as ever. Besides giving fresh life to the fishery, the abolition of the monopoly would put an end to some very oppressive regulations enacted by the Dutch more than a century ago.

Persian Gulf.—The most extensive pearl fisheries are those on the several banks not far distant from the island of Bahrein, on the west side of the Persian Gulf, in lat. 26° 50' N., long. 51° 10' E.; but pearl oysters are found along the whole of the Arabian coast, and round almost all the islands of the Gulf. Such as are fished in the sea near the islands of Karak and Corgo contain pearls said to be of a superior color and description. They are formed of eight layers or folds, while others have only five, but the water is too deep to make fishing for them either very profitable or easy. Besides, the entire monopoly of the fishery is in the hands of the Sheik of Bushire, who seems to consider these islands as his immediate property. "The fishing season is divided into two portions—the one called the short and cold, the other the long and hot. In the cooler weather of the month of June, diving is practiced along the coast in shallow water; but it is not until the intensely hot months of July, August, and September, that the Bahrein banks are much frequented. The water on them is about seven fathoms deep, and the divers are much inconvenienced when it is cold; indeed, they can do little when it is not as warm as the air, and it frequently becomes even more so in the hottest months of the summer. When they dive, they compress the nostrils tightly with a small piece of horn, which keeps the water out, and stuff their ears with beeswax for the same purpose. They attach a net to their waists, to contain the oysters; and aid their descent by means of a stone, which they hold by a rope attached to a boat, and shake it when they wish to be drawn up. From what I could learn, two minutes may be considered as rather above the average time of their remaining under water. Although severe labor, and very exhausting at the time, diving is not considered particularly injurious to the constitution; even old men practice it. A person

usually dives from twelve to fifteen times a day in favorable weather; but when otherwise, three or four times only. The work is performed on an empty stomach. When the diver becomes fatigued, he goes to sleep, and does not eat until he has slept some time. At Bahrein alone the annual amount produced by the pearl fishery may be reckoned at from £200,000 to £240,000. If to this the purchases made by the Bahrein merchants or agents at Aboottabee Sharga, Ras-ul Khymack, etc., be added, which may amount to half as much more, there will be a total of about £300,000 or £360,000; but this is calculated to include the whole pearl trade of the Gulf; for it is believed that all the principal merchants of India, Arabia, and Persia who deal in pearls make their purchases, through agents, at Bahrein. I have not admitted in the above estimate much more than *one-sixth* of the amount some native merchants have stated it to be, as a good deal seemed to be matter of guess or opinion, and it is difficult to get at facts. My own estimate is in some measure checked by the estimated profits of the small boats. But even the sum which I have estimated is an enormous annual value for an article found in other parts of the world as well as here, and which is never used in its best and most valuable state except as an ornament. Large quantities of the seed pearls are used throughout Asia in the composition of majoons, or electuaries, to form which all kinds of precious stones are occasionally mixed, after being pounded, excepting, indeed, diamonds; these being considered, from their hardness, as utterly indigestible. The majoon in which there is a large quantity of pearls, is much sought for and valued, on account of its supposed stimulating and restorative qualities. The Bahrein pearl fishery boats are reckoned to amount to about 1500, and the trade is in the hands of merchants, some of whom possess considerable capital. They bear hard on the producers or fishers, and even those who make the greatest exertions in diving, hardly have food to eat. The merchant advances some money to the fishermen at cent. per cent., and a portion of dates, rice, and other necessary articles, all at the supplier's own price; he also lets a boat to them, for which he gets one share of the gross profits of all that is fished; and, finally, he purchases the pearls nearly at his own price, for the unhappy fishermen are generally in his debt, and therefore at his mercy."—*Manuscript Notes communicated by Major D. Wilson, late political Resident at Bushire.*

The fishery at Algiers was farmed by an English association in 1826, but we are ignorant of their success. The pearl fisheries on the coast of Colombia were at one time of very great value. In 1587 upward of 697 lbs. of pearls are said to have been imported into Seville. Philip II. had one from St. Margarita which weighed 250 carats, and was valued at 150,000 dollars. But for many years past the Colombian pearl fisheries have been of comparatively little importance. During the mania for joint-stock companies, in 1825, two were formed; one, on a large scale, for prosecuting the pearl fishery on the coast of Colombia; and another, on a smaller scale, for prosecuting it in the Bay of Panama and the Pacific. Both were abandoned in 1826. The best fishery ground is said to be in from six to eight fathoms water. The divers continue under water from a minute to a minute and a half, or at most two minutes. They have a sack or bag fastened to the neck, in which they bring up the oysters. The exertion is extremely violent; and the divers are unhealthy and short-lived.—For further information, see HUNT'S *Merchants' Magazine*, xviii. 565.

Pearl shells, commonly called *Mother-of-pearl shells*, are imported from various parts of the East, and consist principally of the shells of the pearl oyster from the Gulf of Persia and other places, particularly the Sooloo Islands, situate between Borneo and the Philip-

pinas the shores of which afford the largest and finest shells hitherto discovered. On the inside the shell is beautifully polished, and of the whiteness and water of pearl itself: it has the same lustre on the outside, after the external laminae have been removed. Mother-of-pearl shells are extensively used in the arts, particularly in inlaid work, and in the manufacture of handles for knives, buttons, toys, snuff-boxes, etc. The Chinese manufacture them into beads, fish, counters, spoons, etc.; giving them a finish to which European artists have not been able to attain. Shells for the European market should be chosen of the largest size, of a beautiful pearly lustre, thick and even, and free from stains. Reject such as are small, cracked or broken, or have lumps on them. When stowed loose as dunnage, they are sometimes allowed to pass free of freight.—MILBURN'S *Oriental Commerce*. The imports during the three years ending with 1842 amounted, at an average, to about 950,000 lbs. a year.

Artificial Pearls.—These are small globules or pear-shaped spheroids of thin glass, perforated with two opposite holes, through which they are strung, and mounted into necklaces, etc., like real pearl ornaments. They must not only be white and brilliant, but exhibit the iridescent reflections of mother-of-pearl. The liquor employed to imitate the pearly lustre is called the *essence of the East* (*essence d'Orient*), which is prepared by throwing into water of ammonia the brilliant scales, or rather the *lamellæ*, separated by washing and friction, of the scales of a small river fish, the blay, called in French *ablette*. These scales digested in ammonia, having acquired a degree of softness and flexibility which allow of their application to the inner surfaces of the glass globules, they are introduced by suction of the liquor containing them in suspension. The ammonia is volatilized in the act of drying the globules. It is said that some manufacturers employ ammonia merely to prevent the alteration of the scales; that when they wish to make use of them, they suspend them in a well-clarified solution of isinglass, then pour a drop of the mixture into each bead, and spread it round the inner surface. It is doubtful whether, by this method, the same lustre and play of colors can be obtained as by the former. It seems, moreover, to be of importance for the success of the imitation, that the globules be formed of a bluish, opalescent, very thin glass, containing but little potash and oxyd of lead. In every manufactory of artificial pearls there must be some workmen possessed of great experience and dexterity. The French are supposed to excel in this ingenious branch of industry. False pearls were invented in the time of Catherine de Medicis, by a person of the name of Jaquin. They are made of small globules of glass, blown by the ordinary lamp. The pearly lustre is communicated by introducing by means of a blow-pipe a small quantity of nacreous substances obtained from the surface of the scale of a small fish very common in the Seine and the Rhine, and also in the Thames. This substance preserved with sal ammoniac in a liquid state is commonly sold under the name of "*Oriental essence*." After having covered the inside of the pearl with this liquid, a coating of wax is added, which is colored to the required shade. The manufacture of pearls is principally carried on in the department of the Seine in France. There are also manufactories in Germany and Italy, but to a small extent. In Germany, or rather Saxony, a cheap but inferior quality is manufactured. The globe of glass forming the pearl in inferior ones being very thin, and coated with wax, they break on the slightest pressure. They are known by the name of German fish pearls. Italy also manufactures pearls by a method borrowed from the Chinese; they are known under the name of Roman pearls, and a very good imitation of natural ones; they have on their outside a coating of the nacreous liquid. The Chinese pearls are made of a kind of gum, and are covered likewise with the same liquid. In the year

1834 a French artisan discovered an opaline glass of a nacreous or pearly color, very heavy and fusible, which gave to the beads the different weights and varied forms found among real pearls: gum instead of wax is now used to fill them, by which they attain a high degree of transparency, and the glassy appearance has been lately obviated by the use of the vapor of hydro-fluoric acid. This acts in such a manner as to deaden the surface, and remove its otherwise glaring look.—*USE'S Dictionary.*

Peas (Ger. *Erbsen*; Fr. *Pois*; It. *Piselli*, *Bisi*; Sp. *Pesoles*, *Guisantes*; Russ. *Gorochi*). The pea is one of the most esteemed of the leguminous or pulse plants. There are many varieties; but the common garden pea (*Pisum sativum*), and the common gray or field pea (*Pisum arvense*), are the most generally cultivated; being reared in large quantities in all parts of the country. But since the introduction of the drill husbandry, the culture of the pea as a field-crop has been to a considerable extent superseded by the bean. Sometimes, however, it is drilled along with the latter; for, being a climbing plant, it attaches itself to the bean, so as to admit the ground being hoed, at the same time that the free admission of air about its roots promotes its growth. It is not possible to frame any estimate of the consumption of peas. The field pea is now hardly ever manufactured into meal for the purpose of being made into bread, as was formerly the case in many parts of the country; but there is reason to think that the garden pea is now more extensively used than ever.—*LOUBON'S Encyclopedia of Agriculture*; BROWN on *Rural Affairs*.

Various kinds of pulse, from the facility with which they are produced in almost every country of the globe, and the highly nutritive properties which they usually possess, have been a favorite food for man and animals among all nations, and in every age of the world. Thus we find that the Athenians employed soddan beans in their feasts dedicated to Apollo, and that the Romans presented them as an oblation in their solemn sacrifice called *Fabaria*. Pliny informs us that they offered bean-meal cakes to certain gods and goddesses in these ancient rites and ceremonies; and Lempriere states that bacon was added to beans in the offerings to Cama, not so much to gratify the palate of that goddess as to represent the simplicity of their ancestors. The bean came originally from the East, and was cultivated in Egypt and Barbary in the earliest ages of which we have any records. It was brought into Spain and Portugal in the early part of the eighth century, whence some of the best varieties were introduced into other parts of Europe, and finally into the United States. The first beans introduced from Europe into the British North American colonies were by Captain Gosnold, in 1602, who planted them on the Elizabeth Islands, near the coast of Massachusetts, where they flourished well. They were also cultivated in Newfoundland as early as 1622; in New Netherlands in 1644; and in Virginia prior to 1648. French, Indian, or kidney beans were extensively cultivated by the Indians of New York and New England long before their settlement by the whites; and both beans and peas (calavances), of various hues, were cultivated by the natives of Virginia prior to the first landing of Captain John Smith. Among these were embraced the celebrated cow-pea (*Phaseolus*), or Indian pea, at present so extensively cultivated at the South for feeding stock, as well as for the purposes of making into fodder, and for plowing under, like clover, as a fallow crop.

The varieties of beans at present cultivated in the United States, as field and garden crops, are too numerous to admit of repetition in this report. For field culture, the common small white, the red-eyed China, the turtle-soup, the Mohawk, and the refugee are preferred; for garden culture, the Mohawk, the early six-weeks, the early Valentine, the yellow six-weeks, the black Valentine, the royal white kidney,

the Carolina, or Sewee, the cranberry, the London horticultural, and the Dutch case-knife. The yield usually varies from thirty to sixty bushels per acre, weighing sixty-three pounds to the bushel. The common pea is supposed to have been indigenous to the South of Europe, and was cultivated both by the Greeks and Romans. Its introduction into the British North American colonies probably dates back to the early periods of their settlement by Europeans, as it is enumerated in several instances among the cultivated products of this country by our early historians. The cultivation of the pea as a field crop is principally confined to the Middle, Eastern, and Western States, the varieties of which are distinguished as the early and the late ripening. The early varieties are generally small and dark-colored, among which the gray and grass are the most common. The yield varies from twenty-five to forty bushels per acre, weighing sixty-four pounds to the bushel. The marrow-fats are among the richest of the field peas, which are much preferred for good lands. The small yellow are thought to be best for poorer soils. A very prolific "bush pea" is cultivated in the Southern States, bearing pods six or seven inches in length, which hang in clusters, and are filled with fine white peas, much esteemed for the table, either green or dry. The amount of peas exported from Savannah in 1755 was 400 bushels; in 1770, 601 bushels; from Charleston, in 1754, 9162 bushels; from North Carolina, in 1758, 10,000 bushels; annually from Virginia, before the Revolution, 5000 bushels; annually from the United States, twenty years preceding 1817, 90,000 bushels. The amount of beans annually exported during the last-named period, from 30,000 to 40,000 bushels.—*Patent Office Report.*

Peat, a well-known inflammable substance, employed in many parts of the world as fuel. There are two species of peat. The first is a yellowish brown or black peat, found in moorish grounds in Scotland, Holland, and Germany. When fresh, it is of a viscid consistence, but hardens by exposure to the air. It consists, according to Kirwan, of clay mixed with calcareous earth and pyrites; sometimes, also, it contains common salt. While soft, it is formed into oblong pieces for fuel, after the pyritaceous and stony matters are separated from it. By distillation, it yields water, acid, oil, and volatile alkali, the ashes containing a small proportion of fixed alkali, and being either white or red, according to the proportion of pyrites contained in the substance. The oil which is obtained from peat has a very pungent taste, and an empyreumatic smell, less fetid than that of animal substances, but more so than that of mineral bitumens. It congeals in the cold into a pitchy mass, which liquefies in a small heat; it readily catches fire from a candle, but burns less vehemently than other oils, and immediately goes out upon removing the external flame; and in rectified spirit of wine it dissolves almost totally into a dark, brownish red liquor. The second species is found near Newbury, in Berkshire. In the *Philosophical Transactions* for the year 1757, we have an account of this species, the substance of which is as follows: Peat is a composition of the branches, twigs, leaves, and roots of trees, with grass, straw, plants, and weeds, which having lain long in water, is formed into a mass soft enough to be cut through with a sharp spade. The color is a blackish brown, and it is used in many places for fuel. There is a stratum of this peat on each side of the Kennet, near Newbury, in Berks, which is from about a quarter to half a mile in width, and many miles in length. The depth below the surface of the ground is from one foot to eight. Great numbers of entire trees are found lying irregularly in the true peat. These are chiefly oaks, alders, willows, and firs, and appear to have been torn up by the roots; many horses' heads, and bones of several kinds of deer, the horns of the antelope, the heads and tusks of boars, and the heads of beavers, are also found imbedded in it.

Peck, a dry measure for grain, pulse, etc. The standard, or imperial peck, contains two gallons, or 554.55 cubic inches. Four pecks make a bushel, and four bushels a coomb.—See WEIGHTS and MEASURES.

Pecculation, the term, in the Roman law, for the embezzlement of public money belonging either to the government or to communities. Under *pecculation*, also, was comprised the adulteration of gold, silver, or any metal belonging to government. Connected with it, by a law of the dictator, Cæsar, were the *crimen de residuis* (if a person had received public money for a particular purpose, and did not apply it for the same), and the *sacrilgium* (the theft or misappropriation of money or other things sacred to a god). In most governments the embezzlement of public money by public officers is severely punished. Pecculation and treason were, by the French charter of 1814, the only crimes for which a minister was impeachable.—E. A.

Pellitory, the root of a perennial plant (*Anthemis pyrethrum*), a native of the Levant, Barbary, and the south of Europe. The root is long, tapering, about the thickness of the finger, with a brownish cuticle. It is imported packed in bales, sometimes mixed with other roots, from which, however, it is easily distinguished. It is inodorous. When chewed, it seems at first to be insipid, but after a few seconds it excites a glowing heat, and a pricking sensation on the tongue and lips, which remains for 10 or 12 minutes. The pieces break with a short, resinous fracture; the transverse section presenting a thick, brown bark, studded with black, shining points, and a pale yellow radiated inside. It is used in medicine as a stimulant.—Thomson's *Dispensatory*.

Peltry is the name given to the skins of different kinds of wild animals found in high northern latitudes, particularly in North America, such as the beaver, sable, wolf, bear, etc. When the skins of such animals have received no preparation they are termed *peltry*; but when the inner side has been tanned by an aluminous process they are denominated *furs*.

Pencils (Ger. *Pinzel*; Du. *Pinseelen*; Fr. *Pinceaux*; It. *Pennelli*; Sp. *Pinceles*). The word pencil is used in two senses. It signifies either a small hair brush employed by painters in oil and water colors—they are of various kinds, and made of various materials, some being formed of the bristles of the boar and others of camel's hair, the down of swans, etc.—or a slender cylinder, of black-lead or plumbago, either naked or inclosed in a wooden case, for drawing black lines upon paper. The last sort, which is the one to be considered here, corresponds nearly to the French term *crayon*, though this includes also pencils made of differently-colored earthy compositions. The best black-lead pencils of this country are formed of slender parallelepipeds, cut out by a saw from sound pieces of plumbago, which have been previously calcined in close vessels at a bright red heat. These parallelepipeds are generally inclosed in cases made of cedar wood, though of late years they are also used alone, in peculiar pencil-cases, under the name of ever-pointed pencils, provided with an iron wire and screw, to protrude a minute portion of the plumbago beyond the tubular metallic case, in proportion as it is wanted.

Pendant, or **Pennant**, a sort of long and narrow banner displayed from the mast-head of a ship-of-war, and usually terminating in two ends or points, called the *swallow's tail*. It denotes that the vessel is in actual service. A *broad pendant* is a kind of flag terminating in one or two points, used to distinguish the chief of a squadron. *Pendant* is also a short piece of rope, fixed on each side, under the shrouds, upon the heads of the main and foremasts.

Penknives (Gerin. *Federmesser*; Fr. *Cunifs*; It. *Temperini*; Sp. *Corta plumas*), small knives, too well known to need any particular description, used in making and mending pens. The best penknives are manufactured in London and Sheffield.

Pennsylvania, one of the central United States, lies between 39° 43' and 42° N. lat., and between 74° and 80° 40' W. long. It is 307 miles long and 160 broad, containing 47,000 square miles. Population in 1790 was 434,373; in 1800, 602,545; in 1810, 810,091; in 1820, 1,049,313; in 1830, 1,347,672; in 1840, 1,724,035; and in 1850, 2,311,786. The Alleghany Mountains cross the State from southwest to northeast, and there are many smaller ranges on each side of the principal ridge and parallel to it. The southeastern and northwestern parts of the State are either level or moderately hilly. The soil is generally fertile, and much of it is of a superior quality; the best land on the southeast is on both sides of the Susquehanna. Between the head-waters of the Alleghany and Lake Erie the soil is very fertile. The anthracite coal region is immense. The Mauch Chunk, Schuylkill, and Lyken's Valley coal-field extends from the Lehigh River across the head-waters of the Schuylkill, and is 65 miles in length, with an average breadth of five miles. The Lackawanna coal-field extends from Carbondale, on the Lackawannock; to 10 miles below Wilkesbarre, on the Susquehanna. The Shamokin field has been less explored. Iron ore exists in nearly every county, and in the vicinity of Pittsburgh vast quantities are manufactured. Beds of copper and lead exist, and quarries of marble and building-stone abound. There are in the south part valuable mineral springs. There were in the State, in 1850, 8,628,619 acres of improved and 6,294,728 acres of unimproved land in farms; cash value of farms, \$407,876,099; and the value of implements and machinery, \$14,722,541. *Live Stock*.—Horses, 350,398; asses and mules, 2259; milch cows, 580,224; working oxen, 61,527; other cattle, 562,195; sheep, 1,822,357; swine, 1,040,366; total value of live stock, \$41,500,053.

Early History of Pennsylvania.—The territory of this State was, before the year 1681, for the greater part comprised under the name *Northern Virginia*, and after 1616 under the name of *New England*. When Penn, in the year 1681, obtained from Charles II. a grant of a great tract of land, between 40° and 42° N. lat., he himself wished to give to it the name of *New Wales*; but the king, against Penn's wish, called it, in honor of Penn, *Pennsylvania*. The name is to be found for the first time in the King's charter of the 4th of March, of the year 1681. In the year 1682 Penn, desirous of approaching his province to the sea-coast, bought from the Duke of York the whole tract of land and settlements along the west side of Delaware Bay, the so-called *three lower counties*. This tract of land remained, however, in connection with Pennsylvania only until the year 1776, when the inhabitants of these lands declared themselves independent and founded the State of Delaware. By this the State of Pennsylvania was again excluded from the sea-coasts, and as a nearly entirely inland State the history of its limits is not of a great interest for our hydrographical researches.—J. G. KOHL.

The Delaware River washes the entire eastern border of the State, and is navigable for ships to Philadelphia. The Lehigh, after a course of 75 miles, enters it at Easton. The Schuylkill, 130 miles long, unites with it six miles below Philadelphia. The Susquehanna is a large river, which rises in New York; flows south through this State, and enters the Chesapeake Bay in Maryland. It is much obstructed by falls and rapids. The Juniata rises among the Alleghany Mountains, and, after a course of 180 miles, enters the Susquehanna 11 miles above Harrisburg. The Alleghany River, 400 miles long, from the north, and the Monongahela, 300 miles long, unite at Pittsburgh, and form the Ohio. The Youghiogheny is a small river which flows into the Monongahela.

Agricultural Products.—Wheat, 15,367,691 bushels; rye, 4,805,160 bushels; Indian corn, 19,835,214 bushels; oats, 21,538,156 bushels; barley, 165,584 bushels;

buckwheat, 2,193,692 bushels; peas and beans, 55,281 bushels; potatoes, 5,980,732 bushels; sweet potatoes, 52,172 bushels. Value of products of the orchard, \$723,389; produce of market gardens, \$688,714. Pounds of butter made, 39,878,418; of cheese, 2,505,034; maple sugar, 2,326,525; molasses, 50,652 gallons; beeswax and honey, 839,509 pounds; wool, pounds produced, 4,481,570; flax, 530,307; silk cocoons, 285; hops, 22,088; tobacco, 912,651; hay, tons of, 1,842,970; hemp, 44 tons; clover seeds, 125,080 bushels; other grass seeds, 53,913 bushels; flax seed, 41,728 bushels; and were made, 25,590 gallons of wine. Value of home-made manufactures, \$749,182; value of slaughtered animals, \$8,219,848.—*Census Report*, 1850.

Manufactures.—There were in the State in 1850, 136 cotton factories, with a capital invested of \$4,671,015, employing 4283 males and 4374 females, producing 59,532,000 yards of sheeting, etc.; 5,308,561 pounds of yarn; valued at \$5,812,126; 254 woolen factories, with a capital invested of \$1,776,268, employing 1747 males and 753 females, manufacturing articles valued at \$2,703,409; 178 establishments making pig iron, with a capital invested of \$8,357,525, employing 9264 persons, producing 322,752 tons pig iron, etc., valued at \$6,170,625; 320 establishments, with a capital of \$3,422,924, employing 4783 persons, and making 57,810 tons of castings, etc., valued at \$5,354,881; 131 establishments, with a capital of \$7,620,066, employing 6771 persons, manufacturing 182,506 tons of wrought iron, valued at \$8,902,907; 2380 flouring and grist mills, 2936 saw mills, 1540 tanneries; 103 printing-offices, 328 newspapers, 25 daily, three tri-weekly, one semi-weekly, 275 weekly, eight semi-monthly, 12 monthly, and two quarterly publications. Capital invested in manufactures, \$91,463,210; value of manufactured articles, \$154,944,698.

Canals.—The State of Pennsylvania as early as the

year 1791 initiated a system of inland water communication. William Penn, it is said, first conceived the idea. In 1792 two companies were formed, to build the Schuylkill and Susquehanna, and Delaware and Schuylkill canals. They constructed fifteen miles and abandoned the work. In 1821 the enterprise was renewed, and completed in 1827, when other works were started, and nearly all the present canals authorized and their routes surveyed. The State has now 848 miles of canals, which cost \$24,168,000, according to an estimate considered to be under rather than above the mark. Private companies have built 485 miles of canal, costing \$21,955,000. The State has therefore 1333 miles of canal, costing upward of \$46,000,000. Besides these it has 2164 miles of railroad, which cost some \$58,000,000. The totals of these important improvements added together, make 3497 miles, and their cost foots up \$104,000,000. Their value to the State is not represented by their cost, for without them Pennsylvania would be a wilderness. They unite her to the Great West, to the southern part of our State, and to the great metropolis; and enable her to send her coal and iron to distant marts, enriching her beyond estimate.

The following is presented as a comparison of the anthracite coal trade of Pennsylvania for two years:

	1855.	1856.
	Tons.	Tons.
Reading Railroad	2,213,292	2,148,903
Schuylkill Navigation Co.	1,105,263	1,169,286
Pine Grove	105,656	170,154
Little Schuylkill	437,550	454,514
Lehigh	1,274,906	1,361,332
Lackawanna	1,052,595	1,167,513
Wyoming	553,000	510,000
Shamokin	122,500	126,500
Lyken's Valley	112,000	100,000
Scranton	50,000
Total	6,626,288	7,258,591

FOREIGN COMMERCE OF THE STATE OF PENNSYLVANIA FROM OCTOBER 1, 1820, TO JULY 1, 1856, SHOWING ALSO THE DISTRICT TONNAGE IN 1821, 1831, 1841, AND 1851.

Years ending	Exports.			Imports.	Tonnage cleared.		District Tonnage.	
	Domestic	Foreign	Total.		American.	Foreign.	Registered.	Enrolled and Licensed.

* Nine months to June 30, and fiscal year begins July 1, 1843.

Philadelphia, near the confluence of the rivers Delaware and Schuylkill, in lat. $39^{\circ} 57' N.$, long. $75^{\circ} 10' W.$, and near the head of the Delaware Bay. Vessels of the largest burden ascend the river as far as New-castle, but those drawing above 18 or 20 feet of water can not reach Philadelphia, on account of a bar a little below the city. The entrance to the magnificent bay formed by the embouchure of the Delaware has Cape May on the north, and Cape Henlopen on its south side. The commerce of Philadelphia has not kept pace with her growth in other respects, especially in manufactures. The tonnage in 1856 was 197,228 tons.—See PHILADELPHIA.

Erie, port of entry, is beautifully situated on Presque Isle Bay, on Lake Erie, covers one mile square, and has one of the best harbors on the lake, the channel or entrance to which has lately been much improved; the water is from 11 to 20 feet deep, and the largest steamboats enter without difficulty. There is a light-house on the west side of the entrance of Presque Isle Bay, lat. $42^{\circ} 8' 14" N.$; shows a fixed light, elevated 93 feet above the surface of the lake, and visible for a distance of $14\frac{1}{2}$ miles. The beacon is on the east side of the bay; visible $8\frac{1}{2}$ miles.—For further information of the commerce and resources of Pennsylvania, see *Bankers' Magazine*, New York, 1851–1856; *North American Review*, xlii. 241 (C. CUSHING); HUNT's *Merchants' Magazine*, x. 308, xii. 237; DE BOW's *Review*, xii. 476. See also articles DELAWARE RIVER—COAL—CANALS and RAILROADS.

Penny, formerly a silver, but now a copper coin. This was the first silver coin struck in England by our Saxon ancestors, being the 240th part of their pound; so that its weight was about $22\frac{1}{2}$ grains Troy. Camden derives the word from the Latin, *pecunia*, money. The ancient English penny, penig, or pening, was the first silver coin struck in England, nay, the only one current among our Saxon ancestors, as is agreed by Camden, Spelman, Hickea, and others. The penny was equal in weight to our threepence; five of them made one shilling or scilling Saxon, and 30 a mark or mancuse, equal to 7s. 6d. Till the time of King Edward the First, the penny was struck with a cross, so deeply indented into it that it might be easily broken, and parted, on occasion, into two parts, which were thence called *half-pennies*, or into *four*, which were called *fourthings*, or *farthings*. But that prince coined it without indenture, instead of which he first struck round half-pence and farthings. He also reduced the weight of a penny to a standard, ordering that it should weigh 32 grains of wheat, taken out of the middle of the ear. This penny was called the penny *sterling*; and, as 20 of these pence were to weigh an ounce, the penny thus became a weight as well as a coin. The penny sterling was long disused as a coin, and was scarcely known, except as a money of account, containing the twelfth part of a shilling; but latterly it has been introduced into the British current coin.—See POST-OFFICE.

To ascertain the, as yet unknown, quality of the metal in the old British penny, the chief assayers in Philadelphia were addressed, to procure information from books of reference or actual assay. The answer decided: "The ancients intended fine silver and pure gold in their coins, refined them as well as they could, and issued them for fine metal. But the old silver pennies of Britain are now so few and expensive—one in the mint collection cost seven dollars—we can not afford to assay them." As this point was essential for accurate calculation, Mr. DuBois added, in a postscript, "Since writing the above I have assayed a silver penny of William the Conqueror. It gives a fineness of .950 thousandths, and contains gold equal to .0094 thousandths." This trial shows an alloy of some base metal exceeding .040 thousandths (.0404) contained in the silver penny, diminishing its standard in that degree from one of perfect purity. "The Mint remedy" of the United States, regarded to be a necessary allow-

ance for casual deviations in the quality of silver pieces, can not exceed .003 thousandths, instead of .040, on each side the standard. It is not now proposed at mints to have the coins of the highest quality, but the rule or standard of purity, ordered by law, must be exact, both in fine metal and alloy. By recent proof with wheat corn measure, the weight of the old penny may have varied from five grains in the red to eight grains in the white wheat. The modern "allowance" for variation in quantity is one-fourth or one-half a grain, in a coin approaching the value of the Anglo-Norman penny. The silver penny of old time—the only money except rings known to the native Britons—was at once a coin, a weight, and a measure. Its character of purity checked and ruled the values of all moneys, weights, and measures represented by or deduced from it. Such values do not depend solely on weight nor solely upon fineness, but on their combined powers, the product of both. The keystone of the so-called "system" of 1266 was conceived to be "the weight of the silver penny sterling." But defective quality caused this "keystone" to crumble. The superstructure erected upon such foundation failed, because metallurgical irregularity was not checked by metrical exactness. The measures were faulty throughout—"weighed in the balances, they were both found wanting." The bases for calculation in this ancient scale being inaccurate, no truth could be elicited by any increase of numbers—or quantities in progression. Some of the silver pennies of the early Britons were nearly divided by the impression of a cross, through the middle on the reverse, so they could be broken into half-pennies, and again into quarters, called "fourthings," or farthings. This practice of simple division had continued until silver half-pennies and farthings were specially coined by King John, in 1185—first in Ireland, where his principal Mint was. During the latter part of the reign of Henry the Third, of England, "a penny" of fine gold was ordered of the value of twenty pennies of silver. The word "penny" had its derivation from the French "denier," the "denarius" of the Latins. The French title, shortened into "denny" by the Normans, was easily changed on the English tongue to "penny"—at that time a common term for money in general, of whatever metal it might be. Golden deniers, coined sparingly in France, bearing the figure of a lamb, were called deniers d'agneau, or moutons d'or. During the reigns of the early Norman kings, their rents, though reserved in money, were answered in cattle, corn, and other provisions, because money was then scarce among the people. Coins of gold, named "nobles d'or," were first issued from the British Mint by Edward the Third, in 1344; but with so much difficulty that it was thought necessary to order by law, "no one should be obliged to receive them." It was decided to prove the standard of the silver penny of our remote ancestry, by the approval of English and other contemporaries, in wheat corn grains from "the Old North State of Carolina." Six different growths of the crop of 1856, intended for seed and consumption, selected in October from two prominent varieties, the red and the white, choosing grains of average quality, but perfect fullness, were antagonized by a penny-weight Troy of the purest silver, specially prepared from solution, for assays of gold. No two samples of thirty-two wheat corn grains were found of the same weight. Of early red—May wheat—from thirty-eight to forty and forty-three corns were required to balance the silver piece, while of white wheat from twenty-eight to thirty-five and thirty-six grains effected the same purpose, showing a disproportion equal to fifteen wheat grains in the six parcels; that is, from twenty-eight to forty-three corns—a deviation in the value of a silver penny equivalent to nearly one half the standard weight. An act of Henry the Third, in 1266, explains the primitive initials of these ancient British, Gallic, and German standards, to all which one common deri-

vation is imputed. "By consent of the whole realm, the measure of the king was made, that is to say, an English penny of silver, called a sterling, round, and without any clipping, shall weigh thirty-two wheat corns, taken from the middle of the ear. And twenty pence of silver do make one ounce. And twelve ounces of silver do make one pound. And eight pounds of silver do make a gallon of wine. And eight gallons of wine do make a London bushel, which is the eighth part of a quarter." This general arrangement for money weights and measures was that of the Eastern nations, by which Europe had been overrun. The term "easterlin" of the Norman French was transmuted on the English tongue, first to "easterling," and finally to "sterling."—*Report of Dr. J. H. GIBBON, United States Mint, North Carolina. See POUND.*

Penny-Post. First set up in London and its suburbs by a Mr. Murray, upholsterer, A.D. 1681. Mr. Murray afterward assigned his interest in the undertaking to Mr. Dockwra, a merchant, 1683; but on a trial at the King's Bench bar in the reign of Charles II., was adjudged to belong to the Duke of York as a branch of the general post, and was thereupon annexed to the revenue of the crown.—*DELAUNE, 1690.* This institution was considerably improved in and round London, July, 1794, *et seq.*, and was made a twopenny-post. A penny-post was first set up in Dublin in 1774.—*See POST-OFFICE.*

Pennyweight, a Troy weight, containing twenty-four grains, each grain weighing a grain of wheat, gathered out of the middle of the ear and well dried. The name took its rise from the circumstance that this was anciently the weight of one of our silver pennies.

Pens (Fr. *Plumes à écrire*; Ger. *Schreibfedern*; It. *Penne da Scrivere*; Russ. *Pera Stvoli*), well-known instruments for writing, usually formed of the quills of the goose, swan, or some other bird. Metallic pens have been occasionally employed for a lengthened period; but it is only within these few years that they have been extensively introduced. They are now, however, manufactured in vast quantities, and of an immense variety of forms. But though they have superseded to a very considerable extent the use of quills, and have some peculiar advantages, it does not appear possible to give them the elasticity of the quill, nor to fit them so well for quick and easy writing on common descriptions of paper. Quills are said to have been first used for pens in A.D. 553; but some say not before 635. Quills are for the most part plucked with great cruelty from living geese; and all persons, from convenience, economy, and feeling, ought to prefer metallic pens, which came into use in 1830.—*PHILLIPS.*

For the manufacture of steel pens the best metal, made from Dannemora or hoop (L) iron, is selected and laminated into slips about three feet long and four inches broad, of a thickness corresponding to the desired stiffness and flexibility of the pens. These slips are subjected to the action of a stamping-press, somewhat similar to that for making buttons. The point destined for the nib is next introduced into an appropriate gauged hole of a little machine, and pressed into the semi-cylindrical shape; where it is also pierced with the middle slit, and the lateral ones, provided the latter are to be given. The pens are now cleaned, by being tossed about among each other, in a tin cylinder, about three feet long, and nine inches in diameter; which is suspended at each end upon joints to two cranks, formed one on each of two shafts. The cylinder, by the rotation of a fly-wheel, acting upon the crank-shafts, is made to describe such revolutions as agitate the pens in all directions, and polish them by mutual attrition. In the course of four hours several thousand pens may be finished upon this machine. When steel pens have been punched out of the softened sheet of steel by the appropriate tool, fashioned in the desired form, and hardened by ignition in an oven and sudden quenching in cold water, they are best tempered

by being heated to the requisite spring elasticity in an oil bath. The heat of this bath is usually judged of by the appearance to the eye; but this point should be correctly determined by a thermometer, according to the scale; and then the pens would acquire a definite degree of flexibility or stiffness, adapted to the wants and wishes of the consumers. They are at present tempered too often at random.

IMPORTS OF METALLIC PENS INTO THE UNITED STATES FOR THE FISCAL YEAR ENDING JUNE 30, 1850.

Whence imported.	Value.

England,	113,587
France,	2,020
New Granada,	76
Total value,	\$116,155

Pepper (Fr. *Poivre*; Ger. *Pfeffer*; Du. *Peper*; It. *Pepe*; Sp. *Pimienta*; Russ. *Perez*; Lat. *Piper*), the berry or fruit of different species of plants, having an aromatic, extremely hot, pungent taste, used in seasoning, etc. The following sorts of pepper are met with in commerce: *Black Pepper* (Fr. *Poivre*; Ger. *Schwarzer Pfeffer*; It. *Pepe negro*; Sp. *Pimienta*; Sans. *Mercha*; Hind. *Gol-mirch*; Malay, *Lada*; Jav. *Mariha*), the fruit of a creeping plant (*Piper nigrum*), one of the pepper genus, of which there are upward of 80 species. It is cultivated extensively in India, Siam, the Eastern islands, etc. It requires the support of other trees, to which it readily adheres. It climbs to the height of 20 feet, but is said to bear best when restrained to the height of 12 feet. It begins to produce at about the third year, and is in perfection at the seventh; continues in this state for three or four years; and declines for about as many more, until it ceases to be worth keeping. The fruit grows abundantly from all the branches, in long small clusters of from 20 to 50 grains; when ripe, it is of a bright red color. After being gathered, it is spread on mats in the sun, when it loses its red color, and becomes black and shriveled as we see it. The grains are separated from the stalks by hand rubbing. That which has been gathered at the proper period shrivels the least; but if plucked too soon, it will become broken and dusty in its removal from place to place. The vine produces two crops in the year; but the seasons are subject to great irregularities. Pepper should be chosen of a pungent aromatic odor, an extremely hot and acid taste, in large grains, firm, sound, and with few wrinkles—for of these it always has some. Reject that which is shriveled, or small grained, or which on being rubbed will break to pieces. In point of quality, the pepper of Malabar is usually reckoned the best; but there is no material difference between it and that of Sumatra, and the other islands. In the market of Bengal, where they meet on equal terms, the produce of Malabar is generally about two per cent. higher than the other. In Europe there is generally a difference of $\frac{1}{4}$ d. per lb. in favor of Malabar; but in China they are held in equal estimation. Black pepper sold ground is said to be often adulterated with burned crust of bread.

White Pepper is made by blanching the finest grains of the common black pepper by steeping them for a while in water, and then gently rubbing them, so as to remove the dark outer coat. It is milder than the other, and is much prized by the Chinese; but very little is imported into England.

Cayenne Pepper is the produce of several varieties of the *Capsicum*, an annual plant, a native of both the Indies. The best is brought from the West Indies ready prepared, and is made from the *Capsicum baccatum* (bird pepper). It has an aromatic, extremely pungent, acrimonious taste, setting the mouth, as it were, on fire, and the impression remaining long on the palate. It is sometimes adulterated with muriate of soda; and sometimes with a very deleterious substance, the red oxyd of lead; but this fraud may be detected by its weight, and by chemical tests.

Long Pepper.—This species is the produce of a peren-

nial (*Piper longum*), a native of Malabar and Bengal. The fruit is hottest in its immature state, and is therefore gathered while green, and dried in the sun. It is imported in entire spikes, which are about one and a half inch long. It has a weak aromatic odor, an intensely fiery, pungent taste, and a dark gray color. The root of long pepper is a favorite medicine among the Hindoos. The quantities of the last three species of pepper imported are quite inconsiderable.—MILBURN'S *Oriental Commerce*; AINSLIE'S *Materia Indica*; THOMSON'S *Dispensatory*, &c.

Trade in Pepper.—Pepper is extensively used, all over Europe and the East, as a condiment. It was originally imported into England by way of the Levant; and for many years after the establishment of the East India Company it formed the most important article of their imports. In nothing has the beneficial effect of opening the Indian trade been so unequivocally displayed as in the instance of pepper. The private traders have resorted to new markets, and discovered new sources of supply, which had hitherto been wholly unexplored; so that there has been not only a very great increase in the quantity of pepper brought to market, but also a very great fall in its price, which does not now exceed a third part of what it amounted to in 1814!

Supply of Pepper.—The following instructive details with respect to the supply of pepper are taken from the *Singapore Chronicle*, to which they were contributed by John Crawford, Esq., than whom there can be no more competent authority as to such subjects. Of all the products of the Eastern islands, and of the countries immediately in their neighborhood, in demand among strangers, black pepper is the most important, both in value and quantity. The pepper countries extend from about the long. of 96° to that of 115° E., beyond which no pepper is to be found; and they reach from 5° S. lat. to about 12° N., where it again ceases. Within these limits we have Sumatra, Borneo, the Malayan peninsula, and certain countries lying on the east coast of the Gulf of Siam. The whole produce of the island of Sumatra is estimated not to fall short of 168,000 piculs of 133½ lbs. each; the southwest coast being said to produce 150,000, and the northeast coast 18,000 piculs. The pepper ports on the northeast coast of Sumatra are Lankat and Delli, with Sardang. The first two produce 15,000 piculs, and the latter 3000 annually. The cultivation is carried on by the Battanation in the interior. The ports on the southwest coast, and the amount of their produce, as given in a recent estimate, are as follows: viz., port and district of Trumah, 40,000; district of Pulo Dua, 4000; ditto of Cluat, 80,000; coast from Tampat. Tuan to Susu, 83,000; port of Susu, 1000; Kualla Batta, 20,000; Analabu, 2000; districts to the north of Analabu, 20,000; making in all, 150,000 piculs. Here it is of importance to remark that the culture and production are extremely fluctuating. During the last pepper season, there obtained cargoes on the west coast of Sumatra, 27 American ships, six country traders, four large French ships, besides the ships belonging to the East India Company, which generally take away 500 tons. Nearly the whole of this trade is in the hands of Europeans or Americans; the pepper finds its way to Europe, to America, and in a small proportion to China. The northeast coast of Sumatra, from Pedier down to the Carimons, is estimated, as already mentioned, to produce 18,000 piculs. Prince of Wales Island is the principal *dépôt* for this, from whence the greatest part is exported to India and China. The produce of Prince of Wales Island itself is about 15,000 piculs. Of the islands at the mouth of the Straits of Malacca and Singapore, Bintang, on which Rhio is situated, and adjacent islands, produce 10,000 piculs; and Lingga about 2000. A large proportion of this is brought to Singapore, which exported last year about 21,000 piculs; some part to Bengal and China, but

principally to Europe direct, in free traders. The west coast of the Malayan peninsula produces no pepper, with the exception of about 4000 piculs afforded by the territory of Malacca. On the east coast of the peninsula, the production of pepper is very considerable. The ports of Patani and Calantan—chiefly the latter—yield about 16,000 piculs annually, and Tringanu about 8000. A portion of this is brought to Singapore and Penang; but we believe the greater proportion goes direct to China in junks, of which three large ones frequent Tringanu annually, and one Calantan. The Americans, too, occasionally visit these ports. In the year 1821, three vessels of considerable burden obtained cargoes. The east coast of the Gulf of Siam, from the lat. of 10½° to that of 12½° N., affords an extensive produce of pepper. This coast is scarcely known, even by name, to the traders of Europe. The principal ports here are Chantibun, Tungyai, Pongsom, and Kampot—the first two being under the dominion of Siam, and the latter under that of Kamboja. The whole produce is estimated at not less than 60,000 piculs; 40,000 of which are brought at once to the capital of Siam as tribute to the king, and the whole finds its way to China in junks. It remains only to estimate the produce of the island of Borneo. The whole produce of Borneo is estimated at about 20,000 piculs; of which a large share is carried to China direct in junks, some by Portuguese vessels; and about 7000 piculs are now annually brought by the native craft of the country itself to Singapore in the course of that free trade which is happily flourishing at this settlement. The data which have been stated will enable us to estimate the whole production of the Malayan Archipelago, including that of the peninsula of Malacca, and that of the east coast of the Gulf of Siam, at 308,000 piculs; and as there is no other part of the world that affords pepper, excepting the western coast of the peninsula of India, and this affords but 30,000 piculs, or less than one-tenth part of what the places we have enumerated produce, we have, accordingly, at one view the whole production of the earth, being 338,000 piculs, or 45,066,666 lbs. avoirdupois. The average price of pepper has been lately about nine Spanish dollars a picul; so that the whole value drawn into India from Europe, China, and the New World, on account of this single commodity, is 3,042,000 dollars. The quantity given in this statement may appear enormous; but if meted out to the whole population of the globe, or to 1,000,000,000 of people, it would be found that the average annual consumption of an individual would amount to no more than 323 grains. Mr. Crawford has more recently supplied a revised estimate of the annual production of pepper as follows:

	Pounds
Sumatra (west coast)	20,000,000
" (east coast)	8,000,000
Islands in the Straits of Malacca	3,600,000
Malay peninsula	3,733,333
Borneo	2,666,667
Siam	8,000,000
Malabar	4,000,000
Total	50,000,000

Perch, or **Rod**, a long measure, 16½ feet in length.—*See* **WEIGHTS AND MEASURES**.

Perfume (Fr. *parfum*), a term used to denote the volatile effluvia from any body affecting the organ of smelling, or the substance emitting those effluvia. Perfumes were in general use among the ancients (see the *Quarterly Review*, vol. xxiii.); and in France, Germany, Spain, and Portugal, and even, though not to so considerable an extent, in England, they are regarded almost as necessities. In general they are made of musk, ambergris, civet, rose, and cedar woods, orange flowers, jessamines, jonquils, tuberose, and other odoriferous flowers. Aromatic drugs, such as storax, frankincense, benzoin, cloves, etc., enter into the composition of a perfume; and many perfumes are composed of aromatic herbs or leaves, as lavender, marjoram, sage, thyme, etc.

Perfumery. Many of the wares coming under this name were known to the ancients, and the Scriptures abound with instances of the use of incenses and perfumes. No such trade as a perfumer was known in Scotland in 1768.—**CREECH**. A stamp tax was laid on various articles of perfumery in England, and the vendor was obliged to take out a license, in 1786. At the corner of Beaufort Buildings, in the Strand, resided Lilly the perfumer, mentioned in the *Spectator*.—**LEIGH**.

Some of the most exquisite of perfumes are obtained from the most offensive substances. In olden times the most delicate perfumes were distilled from flowers, whose names they bore; but chemistry has shown how to obtain them from other sources. To give one example, a peculiarly fetid oil, called fusel-oil, is formed during the making of brandy and whisky. Now this loathsome oil, by a particular mode of treatment, is made to yield the fragrant oil of pears; by another process, oil of apples; and by others, oil of grapes and oil of cognac. The oil of pine-apples is produced from sugar and putrid cheese. The oil of bitter almonds is a resultant from aquafortis and the offensive oils from gas tar. The dainty eau de mille fleurs is made from the drainage of cow-houses. And in all these cases, there is not the same kind of fraud which is practiced in ordinary adulterations; for though the perfumes are not actually, in the present state of things, produced from the flowers and fruits which give them their names, yet they are really identical, or nearly so, in chemical composition with the original perfumes; nature mixes the ingredients in one case, man in the other, but the ingredients are the same. The passion for perfumes is increasing. British India and Europe consume about 150,000 gallons of handkerchief odors yearly; and the English revenue from eau de Cologne is about 8000 pounds sterling a year. The total revenue from imported perfumes in England is estimated at about £40,000 sterling per annum. The largest revenues of the estates on the borders of the Mediterranean are those which proceed from the sale of the orange blossoms and Parma violets. The house of Faguer, 83 Rue de Richelieu, and many of the other perfumers of Paris, pay a yearly sum, varying from 10 to 30,000 francs, to the proprietors, for their whole crop of orange blossoms or violets. The *fleurs de citronnier* of Faguer is one of the favorite and most delightful odors used for scenting the pocket handkerchief.

Periodical Publications. These, as the name implies, are publications which appear at fixed periods or stated intervals, and consequently include newspapers, monthly and other magazines, quarterly reviews, and journals, and all such books as appear at monthly or other intervals. But the term "periodical publications" is usually understood in a more confined sense, or as comprising only magazines and such political, literary, and scientific journals as appear at regular intervals, without including newspapers or works published in parts. Even when thus restricted, this is a very extensive and important department of literature. No doubt a vast deal of trash gets into print by

the agency of magazines that might not otherwise see the light; but most part of these publications contain at the same time some superior articles; and a few are ably conducted and embrace a wide range of topics. Since the establishment of the *Edinburgh Review* in 1802, the quarterly journals, especially those that embrace politics and literature, have risen to great eminence, and have had a powerful influence over the public mind. At present, however, and for some time past, the influence of this class of journals has been declining. An ably conducted daily paper is, at this moment, by far the most powerful engine the press can bring into the field.—*See* **NEWSPAPERS**. For further information refer to *American Almanac*, 1835, p. 97, 256, 1836, p. 92; *North American Review*, xxxix. 277 (J. G. PALFREY); *Southern Literary Messenger*, ii. 393; *Westminster Review*, i. 206, ii. 463; *Edinburgh Review*, xxxviii. 349; *American Quarterly Observer*, iii. 185.

Pernambuco Province. This is one of the most important provinces in Brazil. It abounds with many good harbors, and possesses an exceedingly fertile soil. Its chief staples are sugar, cotton, and hides. Of these its average annual exports from 1840 to 1845 were as follows: Sugar, 34,177 tons; cotton, 32,279 bags (160 lbs. each); hides, 72,500. The city of Pernambuco maintains the third rank in the empire. There are in this province about six hundred "engenhos," or sugar estates, each covering about one square league. On each engenho are produced annually about fifty cases of white, and five of brown, or muscovado sugar—or forty tons of the former, and four and a half tons of the latter—equal to about 24,000 tons of white, and 2550 tons of brown, for the whole province. The province is estimated to be capable of yielding 396,800 tons of white, and 40,800 tons of muscovado sugar. Imports from the United States consist chiefly of cotton domestics. Fabrics of this kind, thirty yards in length, and twenty-seven to twenty-eight inches in width, are in demand, and bring much better prices than similar goods from England. Of late years the manufacturers of Lancashire have imitated these cloths, and have succeeded in sharing the advantages which the American article had secured. In printed cottons Manchester and Glasgow almost monopolize the markets of Pernambuco. The quality as well as the cheapness of their goods have secured this privilege. The importation of butter, hitherto almost exclusively in the hands of the French, might be advantageously shared by the citizens of the United States.

In 1840 the French imported.....	4100½	firkins.
" 1841	5549	"
" 1842	5366	"
" 1843	7981	"
" 1844	8962	"
In 1840 were imported from Great Britain	4487	"
" 1841	3889	"
" 1842	3249	"
" 1843	4022	"
" 1844	3616	"

The production of cotton has diminished, owing mainly to the expense attending its transportation to market; but the production of sugar has increased. From 1828 to 1831, the average annual export was 1,607,389 arrobas, and in the years 1841 to 1844 it was augmented to 2,083,212 arrobas; being an annual increase of 475,823 arrobas, or 6797¾ tons. The number of hides exported during the two periods of four years above-named increased in a still greater ratio than sugar. From 1828 to 1831 the annual average export was 60,272 hides; and during the latter four years, from 1841 to 1844, the same average augmented to 122,573 hides per annum; showing an annual increase of 62,301 hides. It has already been observed that if the export duty levied upon the produce of Brazil transmitted to foreign ports were modified or repealed, a vast augmentation in agricultural productions would unquestionably follow. While an export duty of ten per cent. on the weekly average price of

sugar continues, and a similar duty on cotton, coffee, tobacco, rum, hides, and, with one or two unimportant exceptions, on all other articles produced in the country, the producing interests must remain crippled, and exportations either continue to be stationary or decrease. The cotton and sugar-growing districts suffer most under these heavy taxes upon their industry and capital. The planters are obliged to carry cotton and sugar to Pernambuco by horse conveyance, a distance of from twenty to one hundred leagues, during the dry season, when food and water are difficult to be obtained. These charges are such, in addition to those imposed by law, that when the planter reaches market his cotton hardly yields him net four cents per lb. And so with his sugar, and all other heavy produce.

The navigation and trade of Pernambuco in 1845 stood as follows: Inward from all nations—Vessels, 242; tonnage, 49,796; value of cargoes, \$4,136,075. Of which from the United States: Vessels, 35; tonnage, 6117; value of cargoes, \$602,075. Outward to all nations—Vessels, 226; tonnage, 48,539; value of cargoes, \$4,567,870. Of which to the United States: Vessels, 19; tonnage, 3216; value of cargoes, \$283,460. During the year 1845 two United States vessels went south with cargoes; two were sold, and four remained in port. This will, to a certain extent, account for the difference between the values of imports and exports to and from the United States, as above shown.

The vessels from the United States imported as follows:

Cottons	1018 packages.
Silks	3 "
Woolens and silks	1 "
Flour	24,918 barrels.
Do.	648 half-barrels.

And on return voyage home, exported—

Sugar	9,104 barrels.
Do.	23,410 bags.

Total quantity of sugar produced and entered in the market of Pernambuco in the years 1844 and 1845:

In 1844	Arrobas, 2,146,683 = Pounds, 68,624,027
In 1845	" 2,465,824 = " 78,906,371

Of which were sent, in 1845, to the United States, 184,417 arrobas 26 lbs. = (at 32 lbs. to arroba) 5,901,344 lbs.

Hides.—Total number exported to all countries: In 1844, 124,074; in 1845, 163,935. Of which to the United States, 10,888.

TOTAL EXPORTS OF COTTON, SUGAR, AND HIDES FROM PERNAMBUCO FROM 1828 TO 1845, BOTH INCLUSIVE.

Years.	Cotton. Bags.	Sugar. Arrobas.	Hides. Number.
1928	70,785	1,460,628	52,444
1929	54,820	1,463,392	46,573
1830	61,151	1,705,614	65,489

1835	52,142	1,388,838	91,492
1836	62,532	1,825,392	90,701
1837	43,847	1,450,420	93,771
1838	60,648	1,750,380	105,851
1839	39,173	1,878,675	111,052
1840	35,840	2,191,063	132,993
1841	26,990	2,261,699	136,494
1842	21,357	1,906,936	125,296
1843	35,906	2,017,522	104,428
1844	41,385	2,146,683	124,074
1845	26,562	2,565,824	163,935

Number of vessels to and from the United States in Pernambuco in 1846: Vessels, 117, of 30,801 tons.

VALUE OF IMPORTS FROM AND EXPORTS TO ALL COUNTRIES.

	1845.	1846.
Imports	Francs, 24,567,000	17,936,000
Exports	" 20,327,000	19,851,000

Value of imports and exports from the United States in 1846: Imports, 1,928,000 francs; exports, 641,000 francs; total, 2,569,000 francs.

PRODUCTS EXPORTED TO ALL COUNTRIES IN 1846, COMPARED WITH 1847, IN FRANCE.

Years.	Sugar.	Hides.	Cotton.	Tobacco.
1846	15,107,000	2,750,000	1,055,000	644,000
1847	17,478,000	1,124,000	1,326,000	82,000

From the preceding table it will be seen that the market at Pernambuco was more brisk in 1847 than during the preceding year. Sugar is the leading article in this market, and is exported to England, Trieste, Genoa, Portugal, the north of Europe, and to the United States. The total exports of sugar from Brazil are thus distributed throughout the ports of the empire. The exports for 1846 are taken as a basis for calculation:

	Kilo.	Pounds.
Bahia	62,447,000	137,383,400
Pernambuco	40,570,000	8,254,000
Rio de Janeiro	8,244,000	9,825,000
Total kilo. and pounds.	111,261,000	236,533,200

EXPORT OF SUGAR FROM PERNAMBUCO FROM 1852 TO 1854.

Exported to	1851-'52. Tons.	1852-'53. Tons.	1853-'54. Tons.
Great Britain	11,838	15,096	18,505
France—Nantes	1,173

Total	47,156	64,829	50,549

The sugar produced in the province of Pernambuco amounts to about 80,000 tons a year, of which 60,000 are exported to foreign countries, 5000 coastwise, and 15,000 are retained for home consumption. There are about 1000 eugenhos or sugar estates, 257 of which have been established within the last ten years. They average in extent about two square miles, and their crops vary from 200 tons as a maximum to 30 as a minimum; or at an average of about 75 tons each. Very few eugenhos possess 150 slaves, and the smallest not more than 10 or 12; the average number of slaves employed on each eugenho is about 50, so that 50,000 may be said to be here employed in sugar cultivation. They are badly treated and hard worked.

Pernambuco has many of the privileges of a sovereign state; it has its own president, provincial and municipal chambers, levies a portion of its own taxes, and maintains a militia which can not be removed from the province. It sends four senators and fifteen representatives to the imperial government—elected, the former for life, and the latter for four years, by almost universal but indirect suffrage. The imperial revenue levied within the province in 1849-'50 amounted to £512,423; in 1850-'51 to £690,526; and as these sums are derived chiefly from imports and exports, and no additional duties have been imposed, the increase is a proof of its commercial prosperity. The details of the latter year's general revenue were as follows:

Duties upon imports	£426,105
Duties upon exports	61,705
Port charges	7,883
Post-office, crown lands, etc.	34,737
Extraordinaries	1,066
Deposits for charities, restitution unclaimed estates	3,573
Remittance of funds to the imperial treasury	155,354
Total	£690,526

In 1841 the receipt of imperial taxes from the province of Pernambuco amounted to only £273,852 11s. 2d.; so that in the course of ten years it has nearly trebled. Provincial taxes are levied upon sugar, coffee, tobacco, cattle, horses, spirits, passports, licenses for potteries, saw-mills, cigar shops, auctions, etc.; upon houses, legacies, inheritances, slaves, the tolls of bridges, etc., etc. Total amount in 1850-'51, £173,997 5s. The municipal

taxes are derived from the stamping of weights and measures, licenses to public houses, and places of entertainment, etc. They amounted in 1850-'51 to 123,650 reals, or £12,506 11s. 3d., making the total taxation of the province as follows:

Imperial taxes.....	£690,526
Provincial.....	173,997
Municipal.....	12,506
Total.....	£877,030

Of these sums nearly two-thirds are expended by the imperial government; and to this is chiefly to be attributed the many attempts which have been made by Pernambuco to free herself from the imperial connection; and if the weight of a country's taxation may be judged of by its relation to the number of its inhabitants, the province of Pernambuco is as heavily taxed as most European states. The population of the province of Pernambuco amounted, according to the last census, to 606,936; of these 143,102 are white, and 463,834 colored; viz., 4078 Indians, 322,685 mulattoes, and 137,071 blacks. 506,702 were free, and 106,234 are slaves; 315,749 males, and 291,157 females. But the population must have increased considerably of late years.

Pernambuco, a city and sea-port of Brazil, inferior only to Rio Janeiro and Bahia in commercial importance; capital of the province of its own name, on the Atlantic, at the mouth of the Capabaribe, 210 miles northeast from Bahia; latitude of light-house, 8° 3' 25" S.; longitude, 34° 52' W. Population estimated in 1852 at 100,000. It consists of the separate towns of Olinda, Recife, Boa-Vista, and St. Antonio: the first of which is on the main land, and the others lie south from it on a succession of low sandy banks, separated by salt-water creeks and different arms of the river, but connected with each other by two bridges. Recife, or Pernambuco proper, the most southerly, about four miles southwest from Olinda, is defended by the principal forts, and comprises the dock-yard and the large merchants' warehouses. In St. Antonio are the governor's palace, formerly the Jesuits' convent; the treasury, town-hall, prison, barracks, with convents, churches, and several good squares. A long embankment connects this town with the main land. Boa-Vista is extensive, but irregularly laid out; it has one handsome street, and comprises the residences of many of the richer inhabitants of the city, with gardens, various churches and convents, etc. Olinda, though beautifully situated, is in a state of decay, having been deserted by many of its population for Recife and the other parts of the city. The harbor of Pernambuco is defended from the swell of the ocean by an extensive reef (*recife*), which, according to Koster, continues along the whole coast from Maranham, at a variable distance from the shore, and has numberless breaks, through which ships approach the land. This reef, which is said to be of coral, "is scarcely sixteen feet broad at top; it slopes off more rapidly than the Plymouth breakwater, to a great depth on the outside, and is perpendicular within to many fathoms."—*GRAHAM*, in *Modern Traveler*, xxx., 228. This natural breakwater forms the harbor; for though at high-water the waves beat over it, they strike the quays and buildings of the town with diminished force. Along the sandy neck of land between Olinda and Boa-Vista, however, which is not covered by the reef, the surf is very violent; but the harbor itself is quite safe for vessels that are well-found and well-moored. It consists of two parts—the Poco, capable of receiving vessels of 400 tons and upward, entered across a bar on which there are from seventeen to thirty feet of water, and the Mosqueiras, much better protected than the former, but on the bar of which there are but seven feet of water at ebb-tide. Vessels trading with Pernambuco should not, however, draw more than from ten to twelve feet of water.—*BLUNT'S American Coast Pilot*, 51b. The harbor is defended by several strong military works, the principal

being the stone forts of Do Buraco and Do Brum. The light-house, on a reef at the entrance to the harbor, has a revolving light.—See PROVINCE OF PERNAMBUCO; also BRAZIL.

Foreign vessels are not allowed to engage in the coasting trade, but they can load here for any foreign port. Vessels from the United States can discharge part of their cargo, and, if desired, they can proceed on with the remainder to Bahia, Rio de Janeiro, etc.

There are no insurance offices here, all business of that kind being done either in the United States or England. With funds in hand, a commission of 2½ per cent. is charged. Vessels are generally chartered both ways, arriving with flour, the charterer stipulating for a return cargo of sugar. Vessels coming out on their own account have been chartered back this season as low as 60 cents a bag of 160 lbs. Usually, however, the freight ranges from 80 cents to \$1 per bag. There is no business done in exchange between this port and the United States, except the few whalers' drafts that are purchased at from two to twelve per cent. discount. The value of the milreis is governed by the state of exchange on England. The principal articles imported from the United States are flour and tea. The former pays a duty of 3 milreis (\$1 50) per barrel, and the latter pays 600 reis (30 cents) per lb.; hams pay 60 reis (3 cents) per lb.; tobacco pays 180 reis (9 cents) per lb. Sugar and hides are the only articles of export worth mentioning. Sugar pays an export duty of eight per cent. The export duty on hides is ten per cent. on a valuation fixed weekly by a committee appointed for the purpose. The only articles on which this government levies a consumers' tax are, all spirituous and malt liquors, cigars, tobacco, soap, and snuff. Wines and liquors pay 1½ cents a canada (1½ gallons); 56 cents, in addition to this, is levied on each pipe for what the decree terms "charitable purposes." Cigars pay 56 cents per 1000; tobacco, 1 cent per lb.; soap, 1½ cents per lb. This tax affects the United States only in tobacco and snuff.—*Consular Returns for the United States*, 1854.

Perry, a fermented liquor made from pears, in the same manner as cider from apples. The pears best fitted for producing this liquor are exceedingly harsh and tart; but it is itself pleasant and wholesome.—See CIDER; PEARS.

Peru, a republic of South America, between lat. 3° 25' and 21° 48' S., and long. 68° and 81° 20' W. Area, 520,000 square miles. Peru is bounded north by Ecuador, east by Brazil, southeast and south by Bolivia, and west by the Pacific Ocean. Its coast reaches from the mouth of the Rio Tumbez to that of the Loa, 1240 miles; capital, Lima. All the mountains of Peru form part of the great chain (cordillera) of the Andes. From Porco, in Bolivia, it is separated into two chains—that of Ancumar, which runs from the east between the provinces of Carabaya and Azangaro, in the department of Puno, and that which runs to the west through Tacna, Moquegua, and Arequipa. Both reunite afterward near the city of Cusco, and again separate, the one running to the east of the provinces of Huanta and Tarma, and the other to the west of those of Castrovireyna, Huancavelica, and Huarochiri, reuniting themselves again in Pasco. From Pasco three chains detach themselves—the eastern between the Rio Guallaga and the Pachitea, the central one between the Guallaga and the Upper Marañon, and the western one between the latter and the coast of Trujillo and Paita. These several chains reunite in the province of Loja, in Ecuador. The direction of these chains of mountains determines the great valleys of the interior of Peru. The lakes most notable in Peru are those of Titicaca, between the departments of Puno and La Paz, the latter in Bolivia; of Uraos to the south of the city of Cuzco; of Pleyes or Junin; and of Lauricocha, in the department of Junin. Lake Titicaca has a periphery of ninety leagues, and that of Junin of ten leagues. The other two are

smaller. In that of Lauricocha the Rio Marañon has its birth; in that of Junin, the Rio Janja, which runs into the Ucayali; and in that of Titicaca, the Desaguadero (anglice, *outlet*), which empties into the Lake of Paria, in the Republic of Bolivia. The rivers of Peru flow, some to the Pacific Ocean, others into the Amazon, and others into Lake Titicaca. Those that empty into the Pacific are the Tumbes, Chira, Sechura, Jequetepeque, Saña, Viru, Santa, Patavilla, Huaura, Chillon, Rimac, Mala, Cañete, Pesco, Ocoña, Camana, Quilca, Tambo, and Loa; and those flowing to the Amazon are the Tungaragua or Marañon, which takes the name of Amazon at its confluence with the Ucayali, the Guallaga, the Ucayali (formed by the rivers Pachitea, Apurimac, and Beni), and the Rio Yavari. The mineral resources of Peru, like those of Mexico, are inexhaustible. The very name of the country is associated in the mind with ideas of gold and silver. Besides the precious metals, however, the country produces copper, tin, iron, coal, saltpetre, etc., in abundance—the latter, under the name of nitrate of soda, has become an important export. The agricultural staples of the country are sugar, rice, tobacco, etc., which grow in the warmer situations; the vine, wheat, etc., in the milder. Potatoes are cultivated in all parts. Maize is cultivated, and is the common diet of the people. Medicinal plants, drugs, and dye-stuffs form a large part of the exports; and some of the hard woods abound in the forests. The Cinchona, or Peruvian bark, is indigenous to the country: it grows at the elevation of 10,000 or 12,000 feet, and abounds most in the northern provinces. Among the wild animals of Peru are the puma, the utrunca (a species of tiger), the acumari (a black bear), and great varieties of deer, wild bears, armadillos, etc. The llama, alpaca, guanaco, vicuña, etc., are the most valuable animals. Four varieties of condor are indigenous. Of acclimated animals the sheep has succeeded best, and goats, hogs, etc., thrive well. In the mountains cattle and horses find a congenial climate, but on the coast speedily pine and die away. The wool of Peru is among the best in the markets. The political divisions of Peru consist of eleven departments, and two provinces called "litorales." The departments are subdivided into sixty-one provinces, the provinces into districts, and these into parishes. The government, civil and economical, of each department is in charge of a Prefect, dependent directly on the President of the Republic; that of the provinces is in charge of Sub-prefects, dependent on the Prefects; that of the districts is in charge of Governors, and that of parishes is in charge of Sub-governors. The departments and the population in 1852 were as follows:

Departments.	Population.	Capitals.
Amazonas	43,074	Chachapoyas.
Ancash	219,145	Huarez.
Arequipa	119,336	Arequipa.
Ayacucho	132,921	Utamanga.
Cuzco	349,718	Cusco.
Huancavelica	70,117	Huancavelica.
Junin	222,949	Cerro de Pasco.
Libertad	263,553	Trujillo.
Lima	253,801	Lima.
Moquegua	61,432	Tacna.
Puno	285,661	Puno.
Provincia Littoral de Callao	8,453	
Provincia Littoral de Plura	76,932	
Total population	2,106,492	

The most eastern parts of the departments of Amazonas, Junin, Ayacucho, and Cuzco have not been well explored, and are inhabited by diverse tribes of savage Indians, for whose civilization different missions have been established, and to whom belongs entirely all the territory to the east of the Ucayali, and where the Prefects of the departments above-named do not exercise their authority.

Peru is an integral republic. The Constitution, which was finally settled in 1839, recognizes legislative, judicial, and executive powers entirely separate and independent of each other. The legislative power is vested in a Senate and Assembly, chosen by the peo-

ple through electoral colleges; the deputies are apportioned in the ratio of one to every 20,000 inhabitants. The judiciary is appointed by the President, and judges are not removable except for cause. The Constitution provides for sub-judiciaries, having separate qualifications, for departments, districts, towns, and parishes. The executive power is delegated to a President, whose term is six years. There is no Vice-president, but the President of the Executive Council supplies the place of President in case of the removal, inability, or death of that officer. The Council consists of the Ministers and members of the Senate. The established religion is the Roman Catholic. The Church is presided over by an Archbishop and several suffragans. It is immensely rich. The Inquisition has been entirely abolished throughout the Republic.

Peru was conquered in 1532 by the Spaniards, under Pizarro and Almagro, and remained a colony of Spain for nearly three hundred years. The independence of the country was proclaimed at Lima, 28th July, 1821. Since that period the following parties have exercised supreme power: General San Martín, to 21st September, 1822; thence a "Junta Gubernativa," composed of General Lamar and Señors Salazar-y-Baquijano and Alvarado; thence General Don José de la Riva Agüero, as President, to July, 1823; thence José Bernardo Tagle; thence General Simon Bolivar, to July, 1835; thence a "Council of Government," to the end of 1826; thence General Bolivar, as President; thence General Lamar, as Constitutional President, to June, 1829; thence General Gamarra, to 1833; thence General Orbegoso; thence General Salaberry, as "Supreme Chief," to 1836; thence General Santa Cruz, to 20th January, 1839; thence General Gamarra, to November, 1841; thence Señor Menendez, to August, 1842; thence Vidal, Figuerola, and Vivanco, successively, to 1844; thence Menendez (restored), to 1st April, 1845; thence General Ramon Castilla, to 1st April, 1851; and thence General Rufino Echenique, the present President.

The following is a statement of the public debt of Peru, as given by Señor E. Escobar de Bedoya, attaché to the Legation of Peru at Paris, 26th October, 1853:

Loans on the four-and-a-half in England	\$13,000,000	£2,600,000
Loans on the three per cents. in England	8,500,000	1,700,000
Interior debt	23,200,000	
Debt to Chili	2,000,000	
Debt to the Republics of Old Columbia	3,600,000	
Total	\$50,300,000	

The deposits of Chincha alone are worth three hundred millions of dollars (piastres). The Chincha and Lobos Islands, off the coasts of Peru, are of immense value to the country, on account of their guano deposits. This substance is the most potent of fertilizers, and until lately the islands above-named were the only sources whence it was derived. According to a report made by Señor Villa in 1842, the deposits in these islands were estimated to be 46,632,280 tons. Assuming the consumption to be 300,000 tons a year, valued at \$20 a ton, it would produce \$6,000,000 annually, and require 160 years for its total consumption. This resource has been an efficient aid to the national treasury, and has made Peru the most apparently prosperous of all the South American republics. The exports in 1852 amounted to 220,500 tons—32,000 of which went to the United States, and the remainder to France and England.—See article GUANO.

According to a treaty between Peru and the United States signed July, 1857, it is agreed that the permission to the whale ships of the United States by the treaty of 1851, to barter or sell their supplies and goods to the value of two hundred dollars, *ad valorem*, without being obliged to pay port or tonnage dues or other imposts, should not be understood to comprehend every kind of merchandise without limitation, but those only that whale ships are usually provided with for their long

voyages. That in the said exemption from duties of every kind are included the following articles in addition to the produce of their fishery, viz., white unbleached domestics, white bleached domestics, wide cotton cloths, blue drills, twilled cottons, shirting stripes, ticking, cotton, prints, shirtings, sailors' clothing of all kinds, soap, slush, boots, shoes, and brogans, axes, hatchets, biscuit of every kind, flour, lard, butter, rum, beef, pork, spermaceti and composition candles, canvas, rope, tobacco.

The principal ports of Peru are Paita, San José, Huanchaco, Callao, Islay, Arica, and Iquique. These are ports of entry for foreign commerce. There are other ports open to the coasting trade, and for the exportation of the produce of the country. These are Ylo, Chala, Pisco, Huacho, Casma, Pacasmayo, and Tumbes, and the small harbors of Secura, Samano, Santa, Supe, Huarnes, Echenique, Chancay, Ancon, Cerro, Azul, Chinca, Cancato, Nasca, Quilca, Cocotea, Morro de Sama, and Písacue.

The commercial relations of the United States with Peru are regulated by the treaty already cited, bearing date July 26, 1851, and by such decrees and orders as are issued from time to time by the Supreme Government of that republic. The treaty guarantees entire liberty of commerce and navigation, and perfect reciprocity between the flags of the two countries in the ports of the other.

The trade between the two nations (Peruvian guano excepted) is not, however, very extensive, as appears from the official returns of the United States Treasury Department. Before entering into the details of the commerce between the United States and Peru, the following summary of the general foreign trade of that republic is given, with a view to show the relative rank held by the United States and other nations in that trade. The figures are derived from the official returns of the Peruvian government for the years 1851 from all nations, and in 1851 and 1853 from the United States.—See *Commercial Relations of United States*.

Balance of foreign trade in favor of Peru, during these three years, \$12,290,956; making an annual average in favor of Peru of \$4,096,985. The number of vessels employed in the steam navigation of Peru is: six steamships belonging to the British mail line, which ply semi-monthly between Valparaiso and Panama. The aggregate tonnage of these six steamers is 3506 tons. There is also a seventh steamer of 500 tons on the same line. One Peruvian steamer, of 250 tons burden, coasts regularly between Callao and Valparaiso. The two latter are screw-propellers; the other six have paddle-wheels. The merchant marine of Peru in 1852 consisted of nine ships, with an aggregate of 3194 tons; ten barks, measuring in all 4156 tons; and eight brigs, of 1681 tons; making a total of twenty-seven vessels, with an aggregate of 9031 tons. The total number of Peruvian vessels employed in the coasting trade during the same year was 141, with an aggregate of 14,705 tons. The number of seamen engaged in this service is about 4000, of which 2150 are natives, and 285 citizens of the United States—1260 being employed in the foreign trade, and 2750 in the coasting trade. The tables on next page, transcribed from French official authorities (the dollars having been reduced to francs by multiplying by 5), exhibit in detail the general import and export trade of Peru in 1853.

Callao is the chief port in Peru for foreign commerce. The aggregate tonnage of Peruvian vessels, belonging to and employed in foreign trade at Callao, in 1852, was 67 vessels, measuring an aggregate of 15,031 tons; in the coasting trade the number of vessels was 181, with a tonnage of 17,705 tons; making a total of 248 vessels, and 32,736 tons. Besides the above, there were employed, during the same year, at the port of Pisco, six vessels of 1200 tons aggregate; and at the port of Huacho (both ports being in the consular district of Callao), eight vessels, with an aggregate of 400 tons; making a total in both ports of 1600 tons. The total number of Peruvian vessels which entered at Callao (in foreign trade) in 1852 was 150, with a tonnage of 19,478 tons; and the number cleared, 157 vessels, with a tonnage of 19,326 tons. The number and tonnage of United States vessels which entered Callao during the same year was: vessels, 69; tonnage, 27,360 tons; and the number and tonnage of those cleared was: vessels, 56; tonnage, 23,660 tons. The following comparative table shows the rank which the United States held, relatively with other foreign nations, in the navigation of this port in 1852, including British mail steamships:

Nationality.	Entered.		Cleared.	
	Vessels.	Tons.	Vessels.	Tons.
United States.....	69	27,360	56	23,660
English.....	210	108,000	260	151,000

United States at that port, as follows: "The most valuable of the articles imported into this consulate are assorted merchandises from England, France, Italy, the United States, Chili, Spain, and Equador; viz., Cotton, linens, silks, wines, hardware, etc. From the United States, domestic cottons, furniture, lumber, provisions, etc. The export trade of Peru consists chiefly of guano, which is sent to England, the United States, France, and Spain, and in smaller quantities to Italy, India, and the West Indies. The export was forced during the revolution, and a diminution has taken place under the present government, owing to over-supplies in Europe and the United States, and a wish on the part of Peru to raise the price of this article abroad to its consumers. It is valued on board the ships at the islands where laden at \$5 per ton—that is, at the cost attending its shipment. The average rate of freights to the United States during the year past (1855) has been \$22 per ton of 2240 lbs. This much of the product of guano goes into the hands of our ship-owners, who carry nearly all of it to the United States, and part of it to other places, from Callao and the Chincha Islands. No prohibitions exist, in fact, upon imports; but arms and munitions of war are difficult of introduction during revolutions. Powder is strictly prohibited. The general trade regulations are liberal. Goods lie in bond at the option of the merchant; paying only, after the first month, storage and labor, until entered for consumption, or else exported abroad, and then no charges further. There are at present no differential or discriminating duties on any foreign vessels or goods. A quarantine exists in the case of coolies from China, who usually arrive sick; and this district, during the last three years, has become subject to fatal epidemic fevers, etc. United States capital is employed in the

ice trade, and in repairing ships; in the humbler trades, and in commerce, and upon the public works. The English at present enjoy the largest share of the import and export trade; but the activity and intelligence of all commercial nations are occupied in seeking a share, and the tendency is gradually toward a more equal participation.

Crude wools are largely exported; but the high duty on them in the United States throws nearly all that trade into Europe, mostly to England, where wool is free under the tariff. Of late they have been paying good profits. This remark applies also to the barks of Peru, and to copper. The bar silver exported all goes to England, because there is no direct steam communication with the United States. Some supplies of wheat, flour, and other agricultural products begin to be imported into this consular district from California, such as barley, potatoes, etc.; and about 2500 flasks of quicksilver, valued at nearly \$100,000, have been imported during this last quarter. Whale ships, while cruising, call at times for refreshments, and to change their crews. The agricultural industry of the country has been obstructed by the liberation of the slaves in 1855, to replace whom Chinese coolies are being imported. Such laborers are also now being employed by the government at the Chincha guano islands, near Pisco. The army of Peru employs about 7000 Cholo half-breed Indian soldiers, the tendency of which policy is to hinder population. There is a perceptible increase in the number of Americans in this consulate—seamen, artisans, and tradesmen, who come to reside. Nitrate of soda is largely exported—at least a million and a half of quintals annually, valued at \$2 per 100 lbs.; a considerable part of which goes to the United States. Dry and salted hides, and straw

hats, are exported in small quantities. The circulating currency of Peru, representing silver, and now the only money in common use, is below the nominal standard about three-eighths, or $37\frac{1}{2}$ per cent. The rate of exchange fluctuates from five to fifteen per cent. on the dollar. The dollar of Peru, in invoices of export to the United States, is now usually valued at from 80 to 85 cents of United States currency. The Peruvian dollar, of pure silver, not in circulation, is worth about $87\frac{1}{2}$ cents of United States currency. Gold coins of Peru are not now seen in common use. Patriot doubloons pass current at \$17, and of late are worth 3 per cent. premium, and but few to be obtained."

Paita.—The chief staples of export from the port of Paita are straw (Panama) hats and Peruvian bark. The exports consist chiefly of cotton manufactures, of iron, and assorted sundries. The official navigation returns for this port, for a period later than 1852, are not at hand. There entered from all foreign nations in that year 185 vessels, with an aggregate of 61,624 tons; of which there were from the United States 42 vessels, measuring an aggregate of 10,256 tons. The direct trade between the United States and this port is limited, owing to the facilities afforded in the coasting trade between this point and Callao.

Arica.—The staple exports from the port of Arica are tin, copper ore, Peruvian bark, and alpaca wool. With the exception of the latter, all these exports are of Bolivian produce. Indeed, the port of Arica is merely a transit port for Bolivian produce and trade. Owing, however, to some misunderstanding between the governments of Peru and Bolivia, which resulted in the imposition by the former, in 1853, of 40 per cent. duty on the produce of the latter passing through this port, this transit trade is now conducted through the port of Cobija (Port La Mar), the only port open for foreign commerce in Bolivia. The imports from the United States are cotton domestics, blue drills, chairs, and shoes, on which last-named article a duty of 40 per cent. is levied.

Iquique.—This port possesses a harbor safe and commodious, and is well protected by the island of Iquique from the heavy swells which, in the winter season, set in from the southwest. With the exception of a few months during the late revolution in Peru, up to the month of July, 1855, when it was declared a *puerto mayor*, Iquique ranked as a *puerto menor*, with some extra privileges. The province of Iquique is the great centre of the nitrate of soda trade, and to this article alone it owes its present position. Out of a population of about 15,000 four-fifths are more or less interested in this trade. At the works, the nitrate of soda varies in value from $81\frac{1}{2}$ cents to \$1 06 $\frac{1}{2}$ per quintal. The rate of carriage to the coast varies from 68 $\frac{1}{2}$ cents to 93 $\frac{1}{2}$ cents per quintal. The average rate paid for the article placed on the beach is \$1 75 per quintal; and this price gives the makers a profit of 9 $\frac{1}{2}$ cents per quintal.

Nitrate of soda is always sold deliverable along side the ship's launch, outside the surf. The merchant has to bag and embark it, which costs him about 21 $\frac{1}{2}$ cents per quintal. Selling it, therefore, at \$1 87 $\frac{1}{2}$, would yield him a profit of 15 $\frac{1}{2}$ cents per quintal.

Nitrate of soda is used in the manufacture of sulphuric and nitric acids, and as a fertilizer. Between 1820 and 1830, attempts were made to export it to the United States and England, but the cargoes were unsalable. Soon afterward, however, its value became known, and at this time the quantity annually exported reaches nearly 1,500,000 quintals, valued at about \$1 25 to \$2 per 100 lbs. The following statement will show the total amount of nitrate of soda exported since 1830, when the trade began:

1830 to 1834, inclusive	Quintals.	361,385
1835 to 1839, " "	" "	761,349

Before Iquique was constituted a *puerto mayor*, foreign vessels from any foreign port could call and anchor, provided their cargoes consisted of nothing but the following articles: Peas, beans, lentils, Indian corn, wheat, barley, nuts, raisins, almonds, cocoa-nuts, flour, bran, biscuit, macaroni, frangallo, cococa, dried potatoes, fat, butter, tallow, lard, jerked beef, cheese, live and dead stock, salted meats, and all kinds of vegetables and roots, candles and soap, fire-wood, timber for building, coals, bricks, iron, steel, nails, tools for mines, empty sacks, twine, machines for making nitrate or distilling water. It is now open to general commerce, and will necessarily become a port of much importance. Being the most windward of the Peruvian ports, vessels proceeding from the south, having other goods on board than those above specified, were obliged to go to Arica, the first *puerto mayor*, and, after dispatching at the custom-house there, beat back again to Iquique, at a cost of from five to fifteen days' sailing. The consequence of this restriction was, that but few vessels entered this port with cargoes direct from foreign countries. Another advantage to be derived from making Iquique a *puerto mayor* is, that it will open a transit trade into Bolivia, and thus render this port an entrepôt for an extensive trade with that republic. The distance to Potosi is much less—less, it is stated by three or four days' journey, than by the way of Cobija. The mules would only have to travel fifteen leagues without water, and the pass in the Cordillera is equally as favorable as by the latter route.

Tumbez.—No vessels except whale ships are allowed to enter at this port. The privileges to which American whalers are entitled by the twelfth article of the treaty of Peru with the United States, have already been stated. The market of Tumbez is supplied chiefly by American whale ships, which usually import small quantities of American manufactured goods, flour, etc. Other foreign whale ships must conform to the general regulations of commerce, which allow them to anchor, provided they have on board only the products of the fishery, provisions and supplies necessary for the use of the vessel and crew, and to sell oil and candles to any amount, in exchange for provisions, free of import duty. The following summary exhibits the number and tonnage of American whaling vessels which arrived at the port of Tumbez, from August, 1852, to June 30th, 1855:

Years.	Number of Vessels.	Tons.
1852.....	28	7,717
1853.....	57	17,179
1854.....	64	19,042
1855 (first six months).....	32	9,740

—United States Commercial Relations.

No deposits of guano which will at all compare with those of Peru seem as yet to have been discovered, although most extensive explorations have been prosecuted; nor has science yet succeeded, though inventive skill has been tasked to the utmost, in manufacturing a substitute which would supersede the use or lower the price of the Peruvian fertilizer.—See GUANO.

* Nine months to June 30, and the fiscal year from this time begins July 1.

A treaty of friendship, commerce, and navigation exists between the United States and the Republic of Peru, the terms of which treaty are adhered to in good faith at the ports of Peru; and although questions sometimes arise in police cases regarding seamen belonging to American vessels, the authorities assist readily in arranging such questions as they occur. The present existing regulations are fixed and definite as regards commerce. Changes in parts of these regulations are made by decrees issued by the President and Congress, when that body is in session, and by the President and Council of State during the recess of Congress, as required by the public exigencies. At present (August, 1855) the government is undergoing the process of a revision of its fundamental laws, now being made by a convention of deputies elected from all sections of the country, and holding its sessions in the hall of Congress at the city of Lima. There are no privileges permitted to the commerce of other nations which are denied or not allowed to the United States. There are no restrictions imposed on the commerce of other nations and not on that of the United States. But a line of eight fine British steamers, carrying the mails and running between the ports of Panama and Talcahuano, under the provisions of a postal convention existing between Great Britain and Peru, are exempted from all tonnage duties and port charges whatsoever in the ports of Peru, in consideration for the transmission of the mails of Peru to and from the various ports of Peru at which they touch in making passages to and from Talcahuano and Panama. The whaling vessels of the United States, also, are allowed certain privileges in the port of Tumbes and all the open ports of Peru, in virtue of the treaty now existing. Some question has been made by Peru as to whether this privilege should allow whale ships to avail themselves of its provisions in one port only, while on a cruise, or at each or any port or ports, and every time they visit such port or other port or ports of Peru. The amount of the port charges made upon the vessels of the United States in the ports of Peru is as follows, namely: Tonnage duty, 25 cents per

ton; anchorage fee, \$8 on vessels to Callao only; anchorage fee on vessels to Callao and the Chincha Islands is \$4 more, making \$12; inspector's fee, \$4 25; custom-house fee, \$4 25. The various stamped papers cost from \$5 to \$12, according to the operations made by the vessel. There are no light-house dues nor any light-houses, and no hospital money is exacted. The tonnage duty is only payable in one port, and only once in six months. There are no pilots nor any pilot system in Peru—the nature of the ports rendering pilots unnecessary. National vessels that measure less than 200 tons do not pay any tonnage duty, but pay the other port charges. National vessels over 200 tons register pay 25 cents per ton, being the same duty that the vessels of all nations are made subject to. The line of eight British mail steamers is exempted from all port charges whatsoever, under the conditions of the postal convention now existing between Great Britain and Peru. The transhipment of goods is permitted in the vessels of the United States, either to another port in Peru or to a foreign port. This privilege is allowed also to the vessels of all nations. By the *Reglamento de Comercio* for 1852, the latest yet published, it is allowed to vessels of all nations to take coastwise, from one open port (mayor) to another, any foreign goods in bond; that is, which have not paid duty; for example, from Arica or Isly to Callao. It is also allowed to take the productions of Peru, and any foreign merchandise free of duty, in the same manner, from any port to another port or ports in Peru. All vessels may go loaded with free goods, and the productions of Peru, not only from one open port to another, but from an open port to a minor port (menor), or from a minor port to an open port (mayor), or in any manner. Vessels of all nations are permitted to go to the port Iquique, to load with nitrate of soda and other articles, and also to proceed from Callao to the Chincha Islands to load with guano.

The moneys, weights, and measures, known and in common use in Peru, are those of Spain, having remained the same as when Peru was a colony of Spain.

The difference between the vara and the yard in the custom-house is eight per cent. additional, the vara being about 83 inches of the English yard of 36 inches. The gross and dozen are the same as in the United States. The gallon of oil, of wine, and of spirits, are each taken at $7\frac{1}{4}$ pounds to the gallon. The fanega is an arbitrary ideal measure, and is regulated by weight; namely, one fanega of wheat is 185 pounds; one fanega of millet is 180 pounds; one fanega of beans is 182 pounds; one fanega of peas is 182 pounds; one fanega of corn is 156 pounds; one fanega of Lima beans is 156 pounds; one fanega of tallow is 180 pounds. But these measures do not come into use in foreign intercourse, or in any large transactions. There is no measure of bulk in use, such as a bushel or a gallon; articles measured in bushels or in gallons in the United States are sold by the pound or quintal of 100 pounds in Peru. The difference between the pound and quintal (of 100 pounds) of Peru and those quantities in the United States is two per cent., the pound of Spain and Peru being two per cent. heavier than the pound avoirdupois of the United States and England.

Insurance to the United States, one and a half to two per cent. Freight, \$20 to \$30 per ton of 2240 pounds, guano, delivered; and the same price on 40 cubic feet measurement of other articles. Commission, two and a half to five per cent. on the invoice. Cash in all cases on exports. Average rate of exchange, five to seven per cent. premium for a bill on the United States, and eight to ten per cent. on United States currency. The true par of exchange is: Specie, six to ten per cent. premium; by exchange, six to seven per cent. Bills, six to seven per cent. premium; by the currency, ten per cent. No duty is charged on merchandise exported. No internal or other taxes are levied on exports. Guano belongs to the government and people of Peru, and is sold by itself.

Peruvian Bark. The trees yielding Peruvian bark, which grow at an elevation of 7000 to 8000 feet on the Andes, have for a long series of years been felled for the sake of their bark, and no pains were taken to replace them. Fears have been naturally entertained that ere long the supply of bark, and consequently of quinine, would fail. Efforts have consequently been made to transplant the tree into countries where it is supposed the climate would be suitable. Dr. Royle has taken measures for introducing Cinchona Calisaya, or the yellow-bark tree, into the higher regions of India; and of late years the Dutch government have employed Mr. Hasskari to transport plants of various species of cinchona from South America to Java and other parts of the Dutch East Indies. These attempts have been successful; and the reports in regard to the growth of the plant are such as to lead to the expectation that ere long the Peruvian bark trees will be scattered over extensive districts, and will thus be saved from destruction.—*Edin. New Phil. Journ.*, No. 9.

Pewter (Ger. *Zinn*, *Zinngeisserzinn*; Fr. *Etain*; It. *Stagno*; Sp. *Estano*, *Peltre*; Russ. *Olovo*), a factitious metal used in making plates, dishes, and other domestic utensils. It is a compound, the basis of which is tin. The best sort consists of tin alloyed with about one-twentieth or less of copper, or other metallic bodies, as the experience of the workmen has shown to be most conducive to the improvement of its hardness and

color, such as lead, zinc, bismuth, and antimony. There are three sorts of pewter, distinguished by the names of plate, trifle, and ley pewter. The first was formerly much used for plates and dishes; of the second are made the pints, quarts, and other measures for beer; and of the ley-pewter, wine measures and large measures. A fine pewter is made, according to Aiken, by fusing together 100 parts of tin, 8 of antimony, 1 of bismuth, and $\frac{1}{4}$ of copper. The use of these additions to tin is to harden it and preserve its color; and a good pewter, when clean and polished, has a silvery lustre, and does not readily tarnish. Common pewter, of which measures and pewter pots are made, is an alloy of lead and tin.

Philadelphia, the metropolis of Pennsylvania, and the second city in the United States of America in population and in manufactures, is in lat. $39^{\circ} 56' 39''$ N., and long. $75^{\circ} 10' 54''$ W., 130 miles from Washington, and 87 from New York. Population in 1800 was 70,287; in 1810, 96,287; in 1820, 119,325; in 1830, 167,325; in 1840, 258,037; in 1850, 408,762; and in 1854, 480,000. It is situated between the Delaware and Schuylkill rivers, five miles above their junction, and extends from the one to the other. The rivers bounding it lie about two miles apart in the narrowest place. The city is 100 miles distant from the ocean by the course of the Delaware. Its principal harbor is on the east, or Delaware River side, where ships come up, and its foreign commerce centres. Philadelphia has an extensive foreign, and a still greater domestic trade; by means of railroads and canals it possesses facilities for communication with a great extent of country. The city is built upon a plain rising gradually from the Delaware on the east, and the Schuylkill on the west, to the height of about 65 feet above the surface of the rivers at highest water. The portion most densely built upon has an outline of about ten miles, and extends along the Delaware River five miles. Philadelphia is laid out with great regularity, the streets, with but few exceptions, crossing each other at right angles. High Street, extending from river to river, and Broad Street, which extends south and north from Penn Square, are very wide and spacious thoroughfares; the other streets are, many of them, neat and cleanly kept. The public buildings are generally tasty and well built edifices, and the private residences have a neat and cheerful appearance. It was surveyed and laid out in 1682 by Thomas Holmes; the ground selected was claimed by three Swedes by the name of Swenson, who held a title to it obtained of the Dutch Governor of New York in 1664. This claim was purchased by Penn.—*Harper's and Lippincott's Gazetteers*.

Manufactures.—This branch of the industry of Philadelphia is very important both as regards value and extent. The vicinity abounds with water-power of great magnitude, and coal is obtained at an easy and cheap rate, so that steam can be applied as a motive power to a great advantage over other places, and which has been made extensively available. Machinery, locomotives, hardware, sugar-refining, cordage, and a variety of wares are produced here.—*Census Report*, 1850.

CAPITAL INVESTED, THE NUMBER OF HANDS EMPLOYED, AND THE VALUE OF THE ANNUAL PRODUCT OF THIS BRANCH OF INDUSTRY, IN THE CITY AND COUNTY OF PHILADELPHIA DURING THE YEAR ENDING JUNE 30, 1850.

Coal Trade, etc.—The coal trade during the year 1853 amounted in value to over \$16,000,000, and the quantity brought to market about 6,000,000 tons. The

commerce of Philadelphia is rapidly on the increase, amounting in value the same year to \$14,500,000, and employing a tonnage of 252,451 tons. In 1854 there was a line of first-class steamships and four lines of sailing-vessels plying between this port and Liverpool; two steamships to Charleston, South Carolina; one to Richmond, Virginia, *via* Norfolk and Petersburg; one to Boston; one to Hartford; two to New York; and one to Baltimore. These vessels were substantial and well built, and most of them constructed in this city. The total number of steamships, ships, barks, brigs, schooners, barges, etc., entering the port during the year 1856, was 27,044.—*See* COAL; COINAGE.

The following railroads centre here: The Camden and Amboy; Philadelphia and Trenton, connecting with the New Jersey; the Camden and Atlantic; Philadelphia and Germantown; Philadelphia, Reading, and Pottsville; the Great Central Railroad of Pennsylvania, with its extensive connections; Philadelphia and Westchester; Philadelphia, Wilmington, and Baltimore, etc. The Schuylkill Navigation Canal, 108 miles long, extends to Port Carbon; and the Chesapeake and Delaware Canal, 14 miles long, extending from the Delaware River at Delaware city to Back Creek, Maryland. These great arteries of traffic contribute much to the trade of Philadelphia.

The city, as consolidated by the act of January, 1854, embraces a territory $2\frac{3}{4}$ miles long, and $5\frac{1}{2}$ average breadth, coextensive with the county. It is divided into 24 wards, and is governed by a mayor, elected for two years, a select council of 24 members for the same period, and a common council of 72 members, elected annually.

Philadelphia was first surveyed and regulated in 1682. It had previously been in possession of the Swedes, some of whom came into the country bordering on Delaware Bay as early as 1627. It was named after a city in Asia Minor, and the plan is said to have been suggested by that of ancient Babylon, and according to the original design of William Penn, its original founder and proprietor, was designed to have equaled that ancient capital in extent; but the idea was soon abandoned, and the charter of 1701 restricted it to the boundaries of the late city proper. Penn's country residence was at Pennsburg Manor, above Bristol, in which was a large Hall of Audience, where he held treaties with the Indians; and the oak arm-chair in which he sat is now in the Pennsylvania Hospital. The first Congress assembled in Philadelphia September 5th, 1774, and adopted a declaration of rights; on July 4th, 1776, the Declaration of Independence; in the autumn of 1776 retired to Baltimore; September 26th, 1777, the city fell into the hands of the British, who occupied it until the 18th of June following. May 17th, 1787, a convention met here, and in September 17th, following, agreed on a Constitution for the United States, when it became the seat of Government of the United States until 1800.

Harbor, Light-houses, Pilotage, etc.—Vessels of the largest burden ascend the river as far as Newcastle, but those drawing above 18 or 20 feet water can not reach Philadelphia on account of a bar a little below the city. The entrance to the magnificent bay formed by the embouchure of the Delaware, has Cape May on its north, and Cape Henlopen on its south side. The former, in lat. $38^{\circ} 57' N.$, long. $75^{\circ} 47' 45'' W.$, is a sandy headland, rising about 12 feet above the level of the sea. It has recently been surmounted by a light-house 60 feet in height. The light revolves once a minute; an eclipse of 50 seconds being succeeded by a brilliant flash of 10 seconds. It is seen in clear weather from 20 to 25 miles off. Cape Henlopen, marking the southern boundary of the bay, is in lat. $38^{\circ} 47' N.$, long. $75^{\circ} 4' 45'' W.$ A little south from it is a hill, elevated about 60 feet above the level of the sea; and on it is erected a light-house 72 feet in height, furnished with a powerful fixed light visible in clear weather.

er ten leagues off. To the north of this principal light, and close to the extremity of the Cape, a second light-house has been constructed, 86 feet above the level of the sea, which is also furnished with a *fixed* light, which may be seen about six leagues off. The channel for large ships is between Cape Henlopen and the banks called the Overfalls. The navigation is, however, a little difficult, and it is compulsory on ships to take pilots. The latter frequently board them at sea; but, if not, as soon as a ship comes between the Capes, she must hoist the signal for a pilot, and heave to as soon as one offers to come on board.

PHILADELPHIA TO THE OCEAN.—DISTANCES, IN STATUTE MILES, FROM PHILADELPHIA (MARKET STREET WHARF) TO THE CAPE, BY THE USUAL STEAMBOAT CHANNEL, AS LAID DOWN ON THE CHART OF THE DELAWARE BY THE UNITED STATES COAST SURVEY.

From Philadelphia (Market Street Wharf) to	Miles

Exports of Breadstuffs.—The annexed statement shows the quantity and value of breadstuffs exported from Philadelphia to foreign ports during 1855 and 1856:

		1855.		1856.	
		Quantity.	Value.	Quantity.	Value.
Flour . . .	Barrels.	218,197	\$1,962,618	343,335	\$2,400,113
Corn meal	"	95,168	485,204	91,249	290,400
Rye meal.	"	12,757	86,238	16,298	68,612
Wheat . . .	Bushels.	226,071	451,921	662,338	1,049,777
Corn . . .	"	636,252	683,752	1,093,621	711,999
Rye, Oats, etc. . . .	"	67,807	100,000	100,000	232,485
Total.			\$3,677,507		\$4,753,336

These figures show a marked difference in the prices of breadstuffs in the years specified, as follows:

	Average Price 1855.	Average Price 1856.
Flour.....	\$8 90½ per barrel.	\$6 90 per barrel.
Corn Meal.....	4 57½ “	3 18½ “
Rye Meal....	6 76 “	4 21 “
Wheat.....	1 99½ per bushel.	1 53½ per bushel.
Corn.....	5 99½ “	6 4½ “

It will be observed also that, had the articles enumerated brought the prices in 1856 that were paid for them in 1855, the value of breadstuffs exported in 1856 would have aggregated \$6,123,216 instead of \$4,753,336, the real cost.

Receipts of Cattle in Philadelphia.—The following tabular statement presents the number of cattle received here during each of the last twelve years, with the exception of the large number brought in by butchers, of which no account can be obtained :

Years.	Bees.	Cows.	Swine.	Sheep.	Total.
1845	51,298	18 8 5	26,455	56,348	153,506
1846	47,500	14,480	18,670	55,810	136,460
1847	50,270	16,700	22,450	67,800	147,220
1848	67,211	14,168	47,690	76,820	205,829
1849	68,120	14,320	46,700	77,110	206,250
1850	68,750	15,120	46,900	82,500	213,270
1851	60,100	15,400	46,700	83,000	215,200
1852	71,200	14,420	49,200	81,200	216,020
1853	71,900	15,100	53,300	72,300	212,600
1854	73,400	15,350	78,000	61,000	227,750
1855	55,250	11,530	65,300	132,500	264,580
1856	61,978	12,900	103,350	240,700	418,928

The following table shows the measurement of grain, seeds, salt, and coal, in Philadelphia, annually, for the last sixteen years. This statement, of course, does not include all the receipts of grain, seeds, etc., at this port.

Years.	Wheat.	Corn.	Rye.	Barley.	Oats.	Seeds.	Beans.	Bit. Coal.	Salt.
1841	467,243½	781,278½	51,371½	44,386	167,508½	19,704½	3040½	118,108	326,132

Total	24,483	25,169	27,555

COMPARATIVE STATEMENT OF THE NUMBER OF VESSELS, FOREIGN AND COASTWISE, WHICH HAVE ARRIVED AT PHILADELPHIA DURING FIVE YEARS.

Total in 1852	25,169
Total in 1853	30,120
Total in 1854	29,001
Total in 1855	30,223
Total in 1856	27,044

The following are abstracts of the vessels entered and cleared at the port of Philadelphia, from and to foreign ports, during the year ending June 30th, 1856; from which it appears that the total number of vessels entered under the American flag during the year was 452, and the tonnage 198,253 tons, being an increase of 32 vessels and 8432 tons over the year 1855. The total number of vessels entered under foreign flags was 125, and the tonnage 37,696 tons, an increase of 10 vessels and 17,497 tons over 1855; making a total increase over the preceding year of 42 vessels and 25,929 tons. The total number of vessels cleared under the American flag was 304, and the tonnage 110,581 tons, a decrease of 22 vessels and 7849 tonnage under 1855; and the total number of vessels cleared under foreign flags was 127, and the tonnage 38,409 tons, an increase of nine vessels and 18,362 tons, making a total decrease from that of the preceding year of 13 vessels, and an increase of 513 tons. See PENNSYLVANIA.

Philippine Islands, a large and important group in the Asiatic Archipelago, forming its northern division, and next to Cuba the most valuable colonial possession of Spain, chiefly between lat. 5° 32' and 19° 38' N., and long. 117° and 127° E., having north and east the Pacific Ocean, west the China Sea, and south the seas of Sooloo and Celebes. There are at least 1200 islands, great and small. Principal islands, Luzon, Mindano, and Palawan, with Mindoro, Panay, Marindique, Negros, Zebu, Bohol, Leyte, Samar, Masbate, and many of less size. Total area estimated at 120,000 square miles. The Spanish dominion is stated to extend over only 52,148 sq. miles. Population, in 1850, 3,815,878, consisting of Europeans, native whites, the Papuan negro race, and independent tribes, Malay Indians, half castes, and Chinese. The islands are of volcanic formation, and contain a chain of active volcanoes. Earthquakes also are of frequent occurrence. The group is within the range of the monsoons, and violent hurricanes are common. From May to September the

western coasts are deluged with rain, while the October monsoon brings rain to the eastern coasts, at other seasons dry. The high temperature and abundance of moisture produce a luxuriant vegetation; so that they are capable of yielding all kinds of colonial, and probably European produce. Rice, millet, maize, sugar, indigo, hemp, tobacco, coffee, and cotton, are raised; and sago, cocoa-nuts, bananas, cinamon, betel, numerous fine fruits, and timber for ship-building are among the products. Buffaloes and most of the domestic animals common in Europe are reared. There are no predaceous quadrupeds; the cayman is found in the rivers. Pearls, pearl-oyster shell, the sea-slug, edible birds' nests, and sapan-wood, are important articles of export hence to China. Domestic weaving is pretty generally carried on by the females, and straw hats, cigar cases, and earthen-wares, are made; but the chief manufacture is that of "Government Manilla" cigars, which occupies 2000 hands at a royal factory in Manilla. The wretched colonial policy of Old Spain excluded all for-

eign ships and Chinese settlers from these islands, and the trade with the Spanish dominion in America was also confined to that conducted annually by a single ship. But such restrictions have vanished since the revolution, and the colony is now making commensurate progress toward prosperity. In 1842, 149 ships, aggregate burden 46,869 tons, entered, and 162 do., burden 50,226, cleared, at the different ports. Imports amounted in value to £900,080, one-third from England, and more than another third from China, the United States, and British India. Exports amounted in value to £974,160, chiefly sent to England, Spain, the United States, China, and Australia. Manilla (which see) is the principal seat of the trade, and also the seat of the government, it being the residence of the captain general. In each of the larger islands is a lieutenant governor; and each of the 30 provinces, governed by an alcalde, is divided into pueblos, or communes. The Roman Catholic religion has been extensively diffused among the Malay population. Public revenue is derived chiefly from duties on exports and imports, the tobacco monopoly, and a capitation tax, which in 1837 was paid by 1,805,142 adults, of whom 901,924 belonged to the island Luzon. Armed force amounts to about 7000 men, one-tenth Spaniards, and the rest Malays. These islands were discovered by Magalhaens in 1521, and settled by the Spaniards in the reign of Philip II., after whom they were named.

The commercial intercourse generally is under the laws and regulations of the mother country, but, in fact, is in some degree dependent upon the local authority, the power being with the governor to order the departure from the colony of any person who may become obnoxious to himself or his government. The regulations are fixed for an indefinite time; amendments are constantly proposed, and, for several years past, a total revision of the tariff of duties on foreign produce has been, from time to time, discussed. Any such changes, though they may be proposed and discussed in Manilla, can only be made law by the home government. In fact, the reins are held very tightly in Madrid, and the governor general is constantly made to feel his dependence upon the minister in power. Citizens of the United States enjoy the privileges of all other foreigners. There is no distinction made in the privileges or restrictions permitted or imposed on the commerce of foreign nations. The port charges consist of tonnage dues, river-cleaning dues, and light dues. The tonnage dues are 25 cents per ton register, if the vessel discharges or takes in cargo; and one-half, or 12½ cents per ton, if she departs without having broke bulk or received cargo. A vessel may land specie without being subjected to the full dues. The river dues, for the support of a mud-boat, are: on a vessel discharging and loading any cargo, 6½ cents per ton; entering in ballast and sailing with cargo, or *vice versa*, 3½ cents per ton; entering with cargo and sailing with same, 3½ cents per ton; entering and sailing in ballast, nothing. The light dues are, on all foreign vessels, 6½ cents per ton register. Spanish vessels pay one half these rates. The transshipment of goods is strictly prohibited. In order to effect a transshipment, the goods must be entered in deposit, actually brought on shore to the custom-house, and then shipped under fresh documents from deposit. There is but one port, this of Manilla, open to foreign shipping, and foreigners are excluded from all internal and coasting trade.

The moneys, weights, and measures in common use in Manilla are authorized by the laws of Spain, but can not be said to correspond with those of the mother country, inasmuch as in Spain the weight and measures are not the same throughout the kingdom. The moneys current here are specie only. Of gold, the doubloon of Spain, Mexico, and the republics of South America, of full weight, is current at \$16. The smaller coins—halves, quarters, and eighths—at their proportionate value. Of silver, the dollar of Spain, Mex-

ico, and the other South American republics, of full weight, is current at \$1 United States currency. The relative smaller coins pass at their relative value. Copper coin is of three sizes; 1 cuarto, 2 cuartos, and 4 cuartos; 160 cuartos are equal to a dollar. Accounts are kept by Spanish merchants in dollars, reals, and cuartos; 20 cuartos equal 1 real; 8 reals equal 1 dollar. Foreigners generally keep their accounts in dollars and cents. The value of these coins is about the same in the United States as here; but not being fixed by the United States laws, there is a fluctuation which can not be reduced to regular limits.

The weights in common use are piculs, quintals, arrobas, and pounds. The pound is about 1½ per cent. heavier than that of the United States. 25 pounds equal 1 arroba, or, at the United States standard, about 25½ pounds; 4 arrobas=1 quintal=101½ lbs.; 5½ arrobas=1 picul=140 lbs. The measures are long measure—inches, feet, yards, fathoms, miles, and leagues. 12 inches make 1 foot; 3 feet make one yard; 2 yards make 1 fathom; 1111 fathoms and 6 inches make 1 mile; 3 miles make one league. The yard (or vara) in use here is about 33 inches of the United States. Grain is usually sold in the country by the cavan. 4 apatanes equal 1 chupo; 8 chupos equal 1 ganto; 25 gantos equal 1 cavan. These differ, however, in the different provinces. In Manilla, a cavan of rice weighs 127 lbs.; of coffee, about 52 lbs.; of wheat, about 150 lbs. A tinaja of oil contains 16 gantos; of wine, 17 gantos.

The rate of insurance to the United States from Manilla is charged 3 to 3½ per cent.; but little is done, however, there being but one local insurance office with a trifling capital, the policies issued by which contain so many exceptions as to make them of very little value. The shipments of produce to the United States are covered by insurance made in the United States or in England. Freight varies constantly, being governed by the supply of tonnage and quantity of produce waiting shipment. At present, \$20 per ton of 40 cubic feet of hemp and other measurement goods, and \$12 or \$13 per ton of 2240 pounds of sugar, are current. These are considered full rates. Commission is charged 2½ per cent. on all purchases for the United States. When a broker is employed he is paid a brokerage commission of 6½ cents per picul on hemp, 6½ per picul on sugar, 3½ cents per picul on rice, and on other articles as may be agreed upon. All articles of produce are bought for cash, and paid for on delivery. Oftentimes payment is made in part before delivery, and in the hemp trade the advances made are very large. The rate of exchange between this and the United States is not quoted, there being no transactions in the regular course of trade. All exchange transactions per American account (and the greater portion of the exports to the United States is paid for in bills) are made through England, bills being drawn here on London bankers, by virtue of credits granted by the bankers themselves in London, or by their agents in the United States. The average rate of exchange during the past year has been, for bills on London, drawn at six months' sight, 5s. 0¼d. per dollar. The par of exchange is about 4s. 2d., the same as in the United States; the currency in silver being about equivalent that of one country with the other. The dollar current here, being of the Mexican and South American currency, is worth one hundred cents in the United States.

Duties on exports are, on hemp, 2 per cent.; on tortoise shell, mother-of-pearl shell, and ratans, 1 per cent. (these three articles last named are, in fact, not productions of this island, but brought from the Sooloo Islands, and pay 1 per cent. import duty); all other articles, 3 per cent. On all imports direct from the United States, 14 per cent. There are no internal taxes of any kind on produce. The rates of wages in agricultural pursuits are very low, generally paid in produce sufficing for the subsistence of the laborer, and difficult

to be reduced to a money standard. Artisans obtain 50 cents per day, and if expert workmen as high as \$1, or even \$1 50 per day. Laborers in and about Manila, 25 cents to 37½ cents per day. On board ships in the bay they are paid 62½ cents per day. At these rates labor is much dearer than in the Atlantic cities of the United States—the quantity and quality of the work done by a Manila workman comparing very unfavorably with that of a man in New York.—See MANILLA, SPAIN. For further information refer to *Quarterly Review*, vii. 235, xvii. 530, xxxv. 323.

The chief exports from Manila (the seat of government, and the chief port of the islands) are hemp, sugar, sapan-wood, cigars, cordage, indigo, coffee, rice, hides, mother-of-pearl shell, almaciga, grass-cloth, and tortoise-shell. The principal imports are cotton fabrics, silks, woollens, haberdashery, drugs, clocks, jewelry, etc.

The leading exports to the United States in 1844 were:

Sugar.....	francs	1,080,000	=	\$205,200
Coffee.....	"	149,000	=	28,310
Hemp.....	"	1,444,000	=	274,360
Indigo.....	"	384,000	=	72,960
Hides.....	"	108,000	=	20,520

Piculs (133½ lbs. each)	217,516	175,100	211,258	202,882	145,738	273,961	290,254	244,137	166,932	393,117

The average price of hemp at Manila is from \$7 to \$7 06½ per picul, though in 1854-'55 it ascended as high as \$10, owing to the Eastern war. The average price of sugar is \$3 37½.

The preceding table shows that the quantity of hemp exported from Manila to the United States in 1853 amounted to 204,534 piculs=27,277,866 pounds; and the quantity of sugar to 194,195 piculs=25,892,667 pounds. The following condensed summary exhibits the total export trade from Manila to the United States during the same year: Hemp, 204,534 piculs; sugar, 194,195 piculs; indigo, 9050 quintals; sapan-wood, 8602 piculs; coffee, 172½ piculs; mother-of-pearl shell, 712 piculs; hide cuttings, 3291 piculs; ratans, 763 piculs; hides, 4,886 piculs, grass-cloth, 19,598 piculs; gum almaciga, 2556 piculs; tortoise-shell, 214 cattie; cigars, 148 thousand. The merchandise above specified was floated in 41 vessels; of which 21 cleared for New York, 17 for Boston, 2 for Salem, and 1 for Philadelphia. The preceding summary exhibits the general character of the imports into the United States from the Philippine Islands. In the official reports published at Manila the trade with San Francisco is given separately from that with the United States. During the year under review (1853), the exports to California consisted of: Sugar, 3976 piculs; coffee, 7548 piculs; rice, 16,876 piculs; cordage, 2285 piculs; cigars, 812 thousand; paddy, 2949 cavanas; panocha, 1818 baskets; Indian corn, 8922 lbs.; garlic, 46 piculs; lime, 78 cavanas; hats, 1200. The total exports from Manila to all countries in 1853 were: Sugar, 566,371 piculs; hemp, 222,689 piculs; sapan-wood, 31,963 piculs; rice, 303,902 piculs; cordage, 12,119 piculs; coffee, 18,080 piculs; cigars, 79,311 thousand; indigo, 9123 quintals; mother-of-pearl, 2040 piculs; hides, 5874 piculs; hide cuttings, 3697 piculs. In cotton goods (the principal import of the Philippine Islands) England and the United States are the chief competitors.

Formerly, if the master of a vessel touching at these islands desired to ship native sailors, he was obliged to give his bond for their return to Manila. This, it is

Imports.—National commerce, \$125,011; foreign commerce, \$3,176,325; imports for deposit, \$718,631.

Exports.—National commerce, \$3,834,069; foreign commerce, \$388,204; exports from deposit, \$436,638. Total imports, \$4,019,967; total exports, \$4,608,911.

The Manila picul is estimated at 133½ lbs.

obvious, was but a mere matter of form, and hence but few of the sailors thus taken away ever returned. After the discovery of gold in California, it was found extremely difficult to procure sailors at any of the Malayan islands; and this difficulty was increased by a new regulation at the Philippines, which requires the consignee to sign the captain's bond for the return of such sailors as should be shipped at Manila. This the consignees are, in most cases, unwilling to do. Hence the trade between the United States and the Philippines remains so long stationary. For a number of years the United States has enjoyed about one fifth of the entire trade of the islands. Were this difficulty in regard to the employment of native sailors removed, this one fifth of the trade would in a short time ascend to one half.

In ship-building at Manila, the timber used is all the growth of the country. The timbers and knees are of "molare;" planking above water is of "mangachapuy," and below of "banaba" in the northern provinces, and "batitanan" in the south; deck beams, molare, or "dougou;" keel of dougon, and waterways of the same. All these woods are very excellent, and, if well seasoned before using, are very durable. The molare is a hard, close-grained, strong wood, but is very heavy; dougon is next in value, and the mangachapuy ranks third. There are many other kinds of wood which are used, according to the caprice of builders. The cost where grown is trifling, but if brought to Manila the addition of freight makes it expensive. The preservation or seasoning of ship-timber is not attended to here; and there are no depositories of ship-timber, properly speaking, though it may always be had in sufficient quantities for repairs to vessels frequenting the islands.

Port-charges.—Vessels arriving in ballast, and not breaking bulk, pay 12½ cents per ton (register tonnage). If cargo is landed or stripped, 25 cents per ton. Mud-machine, 6½ cents per ton; light-house dues, 6½ cents per ton. Spanish vessels pay only one half of the above rates.—*United States Commercial Relations.*

COMMERCE OF THE UNITED STATES WITH MANILLA AND PHILIPPINE ISLANDS, FROM OCTOBER 1, 1820, TO JULY 1, 1856.

* Nine months to June 30, and fiscal year begins July 1, 1843.

Phosphorus, a substance of a light amber color, and semi-transparent; but, when carefully prepared, nearly colorless and transparent. When kept some time, it becomes opaque externally, and has then a great resemblance to white wax. It may be cut with a knife, or twisted to pieces with the fingers. It is insoluble in water; its specific gravity is 1.77. When exposed to the atmosphere, it emits a white smoke, and is luminous in the dark. When heated to 148° it takes fire, and burns with a very bright flame. When phosphorus is inflamed in oxygen, the light and heat are incomparably more intense—the former dazzling the eye, and the latter cracking the glass vessel.—*Thomson's Chemistry*.

Piano-forte. Invented by J. C. Schroeder, of Dresden, in 1717. He presented a model of his invention to the court of Saxony; and some time after, G. Silverman, a musical-instrument maker, began to manufacture piano-fortes with considerable success. The invention has also been ascribed to an instrument-maker of Florence. The square piano-forte was first made by Freiderica, an organ-builder of Saxony, about 1758. Piano-fortes were made in London by M. Zumpe, a German, 1766, and have been since greatly improved by others here. They are now extensively manufactured in Boston, New York, Philadelphia, Baltimore, Albany, Buffalo, Cincinnati, Chicago, and St. Louis, and other cities of the United States.—For "Origin of the Piano-forte" see *Westminster Review*, xxxii. 306.

Piastres, or **Dollars**, Spanish and American silver coins in very extensive circulation. They are used in Spain, Italy, Turkey, South America, the East Indies, etc., varying in value in every country.—See **COINS**.

Pickles are various kinds of vegetables and fruits preserved in vinegar. The substances are first well cleaned with water, then steeped for some time in brine,

and afterward transferred to bottles, which are filled up with good vinegar. Certain fruits, like walnuts, require to be pickled with scalding-hot vinegar; others, as red-cabbage, with cold vinegar; but onions, to preserve their whiteness, with distilled vinegar. Wood vinegar is never used by the principal pickle-manufacturers, but the best malt or white-wine vinegar, No. 22 or 24. Kitchener says that, by parboiling the pickles in brine, they will be ready in half the time of what they require when done cold. Cabbage, however, cauliflowers, and such articles, would thereby become flabby, and lose that crispness which many people relish. When removed from the brine, they should be cooled, drained, and even dried, before being put into the vinegar. To assist the preservation of pickles, a portion of salt is also added, and likewise, to give flavor, various spices, such as long pepper, black pepper, white pepper, allspice, ginger, cloves, mace, garlic, mustard, horseradish, shallots, capsicum. When the spices are bruised they are most efficacious, but they are apt to render the pickle turbid and discolored. The flavoring ingredients of Indian pickle are Curry powder mixed with a large proportion of mustard and garlic. Green peaches are said to make the best imitation of the Indian mango.

Pilchards, fishes closely resembling the common herring, but smaller, and at the same time thicker and rounder. They are rarely found on the British shores, except on the coasts of Cornwall and Devon, particularly the former, where they are taken in great numbers from the middle of July to the end of November, or even the middle of December. It is a saying of the Cornish fishermen, that the pilchard is the least fish in size, most in number, and greatest for gain, taken from the sea.

Pilchard Fishery.—This is carried on along the British coasts of Cornwall and Devon, from the Bolt Head in the latter, round by the Land's End to Padstow and

Bossiney in the former. Its principal seats are St. Ives, Mount's Bay, and Mevagissey. The fish usually make their appearance in vast shoals in the early part of July, and disappear about the middle of October; but they sometimes reappear in large quantities in November and December. They are taken either by seines or by drift-nets, but principally, perhaps, by the former. A seine is a net, varying from 200 to 300 fathoms in length, and from 10 to 14½ feet in depth, having cork buoys on one edge and lead weights on the other. Three boats are attached to each seine, viz., a boat (*seine-boat*) of about 15 tons burden, for carrying the seine; another (*follower*) of about the same size, to assist in mooring it; and a smaller boat (*lurker*) for general purposes. The number of hands employed in these three boats varies from about 13 to 18, but may be taken at an average at about 16. When the shoals of fish come so near the shore that the water is about the depth of the seine, it is employed to encircle them; the fishermen being directed to the proper place for casting or shooting the nets by persons (*huers*) stationed for that purpose on the cliffs and in the boats. The practice is to row the boat with the seine on board gently round the shoal; and the seine being, at the same time, thrown gradually into the water, assumes, by means of its buoys and weights, a vertical position, its loaded edge being at the bottom, and the other floating on the surface. Its two ends are then fastened together, and, being brought into a convenient situation, it is moored by small anchors or grapnels; sometimes, however, one or two smaller seines are employed to assist in securing the fish. At low water the inclosed fish are taken out by a *tuck-net*, and carried to the shore. A single seine has been known to inclose at once as many as 4200 hogsheads (1200 tons) of fish! But this was the greatest quantity ever taken, and it is but seldom that as many as 1200 hogsheads are caught at a time. The "take," in fact, depends on so many accidental circumstances, that while one seine may catch and cure in a season from 1000 to 2000 hogsheads, others in the neighborhood may not get a single fish. In some places the tides are so strong as to break the seines and set the fish at liberty. When the quantity inclosed is large, it requires several days to take them out, as they must not be removed in greater numbers than those who salt them can conveniently manage. Drift-nets are usually about half a mile in length, by about 4½ fathoms in depth; they are shot in the open sea, and entangle the fish in their meshes in the same way as the herring-nets. The fish thus taken are said to be superior to those taken by the seine, though it be doubtful, from their being strangled in the nets, whether they are so good for curing. As soon as the fish are brought on shore, they are carried to cellars or warehouses, where they are piled in large heaps, having a sufficient quantity of salt interspersed between the layers. Having remained in this state for about 35 days, they are, after being carefully washed and cleaned, packed in hogsheads, each containing, at an average, about 2600 fish; they are then subjected to a pressure sufficient to extract the oil, of which each hogshead yields, provided the fish be caught in summer, about three gallons; but those that are taken late in the season do not yield above half this quantity. This oil usually sells for from 12 to 15 per cent. under the price of brown seal oil. The broken and refuse fish and salt are sold to the farmers, and are used as manure with excellent effect. The skimmings which float on the water in which the pilchards are washed are called *dregs*, and are chiefly sold as grease for machinery. The fresh fish in a hogshead of pilchards weigh about 6 cwt., and the salt about 3½ cwt.; but the weight of the hogshead when cured and pressed is reduced to about 4½ cwt.; including the weight of the cask, from 20 to 24 lbs. Four-fifths of the persons employed on shore in the salting, curing, packing, etc., of the fish are women.—Dr. PARIS's *Guide to Mount's Bay*.

Pilots and Pilotage. The name of pilot or steersman is applied either to a particular officer, serving on board a ship during the course of a voyage, and having charge of the helm and the ship's route; or to a person taken on board at any particular place, for the purpose of conducting a ship through a river, road, or channel, or from or into a port. Masters and mates of merchant vessels, after having passed an examination before legally constituted authorities, and possessing a certificate to that effect, may pilot their own vessels within the prescribed limits for which they have passed, without being liable to any penalty. In all other cases, when a master is by law subject to a penalty for not taking a pilot, he is bound to do so when he has the opportunity; and after the pilot is taken on board, the master has no longer any command of the ship, nor is he responsible for the management of her while she continues in the district for which the pilot is authorized to act. When beyond that district, the master again resumes the government of the vessel, the pilot being then no longer liable, although for his own convenience he may still remain on board. In such case he is only to be considered as a passenger, and is not entitled to any remuneration for whatever service he may choose to perform on the voyage, beyond that for which he was originally engaged; but should he remain on board at the request of the master, he is entitled, besides his pilotage, to a further remuneration per day or per month, according to the rules of the respective ports, from the day when he has passed the limits of his license to the day of his return to the port from which he was taken on board. If a master of a vessel in any district within which pilots are appointed to act (usually denominated "Pilots' Water") should, except under the circumstances before stated, refuse the service of a pilot offering to come on board, he immediately renders himself liable to his owners, freighters, or insurers for any damage that may occur to the vessel or cargo, arising from the want of such service. When the law does not compel a master to take a pilot on board, and he nevertheless, of his own discretion, chooses to do so, the pilot is considered to be the servant of the owners, who under such circumstances would be responsible to strangers for the management of the ship during the time he continued in charge. If the master at a foreign port attempt to obtain a pilot and fail, and then, in the exercise of his best discretion, endeavor to enter the port and fail, the insurer is not discharged. If the vessel approach a port in the night, he must make signals for a pilot, and wait a reasonable time for one; and if he attempt to enter the port without one, except in case of extreme necessity, the insurers are discharged. Pilotage constitutes a lien upon the vessel, and may be prosecuted in admiralty. But the pilot must be employed by some person rightfully in possession of the vessel. A pilot can not recover for piloting into an enemy's port.

Great Britain.—Under most charter parties, with the exception of those made for vessels in the coal trade in England, the charge for pilotage is paid by the charterers. Many ports enjoy separate and distinct jurisdictions for the appointment and government of pilots, and the regulations of the rates of pilotage. These jurisdictions are exercised by corporations and other bodies, the privileges of which have been granted either by ancient charters or by parliamentary. Among the many corporations so established, the most important are those of the Trinity House of Deptford Strand, whose jurisdiction is the most extensive; and of the Trinity Houses of Hull and Newcastle. The bodies are authorized within their districts to determine the qualifications of pilots, license them, make regulations for their government, fix and alter pilotage rates, and arrange the limits of the pilotage districts, subject, however, to the special provisions contained in the Merchants' Shipping Act of 1854. The regulations of which are given in summary, as follows:

It is questionable whether the Trinity House may revoke a pilot's license without hearing him; but if, after hearing him, it revoke his license, its decision is binding. The application of the Merchants' Shipping Act of 1854 applies only to the United Kingdom.

Powers of Pilotage Authorities.—Every pilotage authority shall retain all powers and jurisdiction which it now possesses, so far, and only so far, as they are consistent with the provision of the general act. Every pilotage authority has the power to exempt ships from being compelled to employ pilots; also to license pilots; to make regulations as to pilot-boats; to make regulations for the government of pilots; to alter rates of pilotage; to limit pilotage districts—all being within their district.

Power of Appeal to Board of Trade.—If the greater number of qualified pilots belonging to any port, or the local marine board, or any number of owners of ships, masters or insurers, consider themselves aggrieved by any regulations enforced by the pilotage authority, they may appeal to the Board of Trade; and the consequent decision shall be deemed conclusive.

Spain.—No one can be a pilot or officer of a merchant ship without having obtained a license. In case of decease, absence, or illness of the captain, the pilot takes his place, and incurs all his responsibility. The pilot can not change the course, unless the captain agrees to it. In case of difference of opinion, the pilot shall explain his reasons to the other officers; and if the captain persists in his orders, the pilot shall enter his protest in the navigation book.

Russia.—The pilot should look after the vessel, the embarkation and debarkation of merchandise, keep a registry of all that passes on board and of the observations. He owes obedience only to the captain, and should never quit the vessel when the captain is absent unless forced to do so.

Portugal.—The pilot who from ignorance, negligence, or design, loses, or exposes a vessel to damage, is bound to repair her, and is liable to be revoked and pursued by criminal process.

United States.—An act of Congress authorizes all States to make their own pilotage laws, and questions under these laws are cognizable in the State courts. No one can act as pilot, and claim the compensation allowed by law for the service, unless duly appointed. And he should always have with him his commission, which usually designates the largest vessel he may pilot, or that which draws the most water. If a pilot offers himself to a ship that has no pilot, and is entering or leaving a harbor, and has not reached certain geographical limits, the ship must pay him pilotage fees, whether his services are accepted or not. As soon as the pilot stands on deck he has command of the ship. But it remains the master's duty and power, in case of obvious and certain disability, or dangerous ignorance or error, to disobey the pilot, and dispossess him of his authority. If a ship neglect to take a pilot when it should and can do so, the owners will be answerable in damages to shippers and others for any loss which may be caused by such neglect or refusal. Pilots are answerable for any damage resulting from their own negligence or default, and have been held strictly to this liability. The owner is also liable on general principles for the default of the pilot, who is his servant.

The laws passed by the United States concerning pilots are comprehended in the following: August 7, 1789—"That all pilots in the bays, inlets, rivers, harbors, and ports of the United States shall continue to be regulated in conformity with the existing laws of the States respectively wherein such pilots may be, or with such laws as the States may respectively hereafter enact for the purpose, until further provision shall be made by Congress." March 2, 1837—"That it shall be lawful for the master or commander of any vessel coming into or going out of any port situated upon

waters which are the boundary between two States, to employ any pilot duly licensed or authorized by the laws of either of the States bounded on the said waters, to pilot said vessels to or from said port; any law, usage, or custom to the contrary notwithstanding."

Maine.—Pilots are appointed by the Governor and Council upon the recommendation of a majority of the ship-owners and masters in the port for which they are appointed. Bonds are required to the amount of \$5000 for the faithful discharge of the duties, and the pilots are liable for damages from neglect or unskillfulness. Any master may pilot his own vessel.

New Hampshire.—The appointment of pilots is the same as in Maine. Pilots must take charge of vessels drawing over nine feet, except coasting vessels. Bonds for \$1000 are required for a faithful performance of duties. Masters may pilot their vessels when outward bound, and pay no pilotage. But vessels inward bound must pay half pilotage if they refuse a pilot, unless the vessel be within the light-house before a pilot offers, in which case no pilotage is due unless a pilot is employed. The Governor and Council regulate the fees for pilotage, and suspend or remove pilots for misconduct.

Massachusetts.—The Governor appoints pilots, except for the ports of Boston, where two commissioners, and New Bedford, where five commissioners, have the appointing power. The pilots give bonds for \$2000 for the faithful performance of their duties. All vessels, except fishing-vessels and coasting vessels of less than two hundred tons, and vessels trading within the State limits, are bound to employ pilots or pay full pilotage, unless no pilots offer before vessels have arrived within the following limits: viz., within the chops of the harbors of Salem, Marblehead, or Gloucester; within the garnet of Plymouth harbor, or within the bar of any barrel harbor, or within the entrance of Boston harbor, being a line drawn from Harding Rocks to the Outer Graves, and thence to Nahant Head. In such case the master may refuse pilot.

New York.—In this State, Sandy Hook pilots are appointed and regulated by the Pilot Commissioners, who are chosen by the Underwriters and Chamber of Commerce. Hell Gate pilots are appointed by the Governor, and subject to the regulations of the Port Wardens.

The rates of pilotage in and out of New York are as follows: For vessels drawing

14 feet or less...	Inward, \$2 44 ..	Outward, \$1 81 per foot.
14 to 18 feet ...	" 3 06 ..	" 2 12 1/2 "
18 to 21 feet ...	" 3 69 ..	" 2 75 "
21 feet or more ..	" 4 31 1/2 ..	" 3 15 1/2 "

New Jersey.—Sandy Hook pilots for the ports of Jersey City, Newark, and Perth Amboy are appointed by commissioners. The regulations do not differ materially from those enacted in regard to the New York pilots.

Pennsylvania.—Pilots for Philadelphia are appointed by a Board of Wardens. There are three classes of pilots: the first for vessels of any description; the second for vessels drawing less than twelve feet; the third for vessels drawing less than nine feet. Unlicensed pilots are subject to fine and imprisonment. New Jersey and Delaware pilots have power to act without a special license. The first qualified pilot that offers is entitled to take charge of the vessel. A second or third grade pilot may act unless a superior pilot offers before the vessel passes Reedy Island. Coasting vessels pay no half pilotage.

Delaware.—Vessels of 75 tons and upward, unless owned in Delaware, must take a pilot or pay half pilotage.

Maryland.—Pilots for the Chesapeake Bay are appointed by a Pilot Board. Pilots are divided into the same classes as in Pennsylvania. Pilots must take the nearest vessel to shore, or in the most distress. Foreign vessels must take a pilot, if one offers, or pay full pilotage.

Virginia.—Pilots are appointed by a Board. Pilots are divided into three classes, as in Pennsylvania. Vessels other than coasters must take a pilot or pay full pilotage.

North Carolina.—Pilots are appointed by commissioners for each port. Vessels pay full pilotage when refusing a pilot.

South Carolina.—Pilots are appointed by commissioners. Pilots who bring vessels into port are entitled to carry them out. Vessels pay full pilotage to the first pilot offering, whether his services are accepted or not.

Alabama.—Pilots are licensed by the harbor-master and port wardens. Vessels pay half pilotage, if pilot is not accepted.

Louisiana.—The harbor-master and port warden of New Orleans appoint pilots. There are no river pilots. Vessels pay half pilotage to the pilot if his services are not accepted. If the Balize, or regular pilots, carry the vessel to New Orleans, the compensation is a matter of agreement.

Florida.—Pilots are appointed by Pilot Commissioners. Vessels pay half pilotage, refusing a pilot, if outward bound, and full pilotage when inward bound.—See KENT'S *Commentaries*, vol. iii.; PARSONS'S *Mercantile Law*; *Mercantile and Maritime Guide*; BLUNT'S *Shipmaster's Assistant*.

Pimento, Allspice, or Jamaica Pepper (Fr. *Poire de Jamaïque*; Ger. *Nelkenpfeffer*; It. *Piment*), the fruit of the *Myrtus pimenta*, a beautiful tree which grows in great plenty on the hills on the north side of Jamaica. The berries are spherical, and, when ripe, of a black or dark purple color. But, as the pulp is in this state moist and glutinous, the berries are plucked when green; and being exposed in the sun to dry, they lose their green color, and become of a reddish brown. They are packed in bags and hogsheds for the European market. The more fragrant and smaller they are, the better are they accounted. They have an aromatic, agreeable odor, resembling that of a mixture of cinnamon, cloves, and nutmegs, with the warm, pungent taste of the clove. Pimento is used in medicine, but its principal use is in the seasoning of soups and other dishes. "The returns," says Mr. Bryan Edwards, "from a pimento walk in a favorable season are prodigious. A single tree has been known to yield 150 pounds of the raw fruit, or 100 pounds of the dried spice, there being commonly a loss in weight of one-third in curing; but this, like many other of the minor productions, is exceedingly uncertain, and perhaps a very plenteous crop occurs but once in five years. The price in the market, as may be supposed, fluctuates accordingly; but its average for some years past may be set down at 14 cents per pound."—Vol. ii. p. 372, ed. 1819.

Pin, in Commerce, a little necessary instrument, made of brass wire, chiefly used by women in adjusting their dress. When the wire is received in the manufactory, it is wound off from one wheel to another, and passed through a circle of a smaller diameter in a piece of iron. Being thus reduced to its proper size, it is straightened by drawing it between iron pins fixed in a board in a zigzag manner. It is afterward cut into lengths of about four yards, and then into smaller pieces, every length being sufficient for six pins. Each end of these is ground to a point by boys, each of whom sits with two small grindstones before him,

turned by a wheel. Taking up a handful, he applies the wires to the coarsest of the two stones, moving them round, that the points may not become flat. He then gives them a smoother and a sharper point on the other stone. A lad of twelve years of age can point 16,000 in an hour. When the wire is pointed a pin is taken off from each end, till it is cut into six pieces. The head is made solid by the present process; but by the old method it is a separate piece, and is made as follows: One piece of wire is with rapidity drawn round another, and the interior one being drawn out, leaves a hollow tube between the circumvolutions. It is then cut by shears, every two turns of the wire forming one head. These are softened by throwing them into iron pans, and placing them in a furnace till they are red hot. As soon as they are cold they are distributed to children, who sit with anvils and hammers before them. These they work with their feet, by means of a lathe. They take up one of the lengths, and thrust the blunt end into a quantity of heads which lie before them; then catching one at the extremity, they apply it immediately to the anvil and hammer, and by a motion or two of the foot the point and head are fixed together, in much less time than can be described, and with a dexterity that can only be acquired by practice. The pins are thrown into a copper, containing a solution of tin and wine lees. Here they remain for some time, and when taken out their brass color has become changed to a dull white. In order to give them a polish, they are now put into a tub containing a quantity of bran, which is set in motion by turning a shaft that runs through its centre; and thus, by means of friction, the pins become entirely bright. They are now separated from the bran, which is performed by a mode exactly similar to the winnowing of corn; the bran flying off, and leaving the pin behind it fit for sale.—E. A.

The manufacture of pins was commenced in the United States between 1812 and 1820. Among the first established were those at Bellevue and Greenwich, New York. Mr. Lemuel William Wright, of Massachusetts, obtained patents in the United States and in England, and commenced the manufacture at Lambeth, London. John J. Howe obtained patents in 1832-1834, in the United States and in England, and established the Howe Manufacturing Company in New York, which was afterward removed to Birmingham, Connecticut. Mr. Samuel Slocum obtained another patent, and in 1838 established a manufactory of pins at Poughkeepsie, New York. The "American Pin Company" has been established for some years at Waterbury, Connecticut, and is the leading manufactory of the kind in the United States. The improvements produced in the United States have been for several years adopted in England and other parts of Europe.—See *American Journal of Science*, xxxviii. 209; HUNT'S *Merchants' Magazine*, xxv. 641; *Economy of Manufactures*, by BABBAGE.

Pinchbeck (Ger. *Tombak*; Du. *Tombak*; Fr. *Tombac*, *Similor*; It. *Tombacco*; Sp. *Tambac*, *Tumbaga*), a name given to one of the many imitations of gold. By melting zinc in various proportions with copper or brass, some alloys result, the colors of which approach more or less to that of gold. This composition is frequently employed as a substitute for gold, in the formation of watch-cases, and various other articles of a like description. Pinchbeck is sometimes called *Tambac*, and sometimes *Similor*, and *Petit-or*.

Pine, or **Flr**, a species of forest tree, next, if not superior, to the oak, in point of utility and value. There are above twenty species of pine. They do not bear flat leaves, but a species of spines, which, however, are real leaves. They are mostly, though not all, evergreens; but the appearance of the tree, as well as the quality of the timber, varies with the species, and also with the situation in which it grows. Generally speaking, the timber is hardest and best in exposed cold situations, and where its growth is slow.

Scotch pine (*Pinus sylvestris*) is a native of the Scotch mountains, and of most northern parts of Europe; being common in Russia, Denmark, Sweden, Norway, and Lapland. It is straight, abruptly branched, rising in favorable situations to the height of eighty or ninety feet, and being from three to four feet in diameter. It is at perfection when seventy or eighty years old. The color of the wood differs considerably; it is generally of a reddish yellow, or of a honey yellow, of various degrees of brightness. It has no larger transverse septa, and it has a strong resinous odor and taste. In the best timber the annual rings are thin, not exceeding $\frac{1}{10}$ th of an inch in thickness; the dark parts of the rings of a bright reddish color; the wood hard and dry to the feel, neither leaving a woolly surface after the saw, nor filling its teeth with resin. The best Norway is the finest of this kind, and the best Riga and Memel are not much inferior. The inferior sorts have thick annual rings; in some the dark parts of the ring are of a honey yellow, the wood heavy, and filled with a soft resinous matter, feels clammy, and chokes the saw. Timber of this kind is not durable, nor fit for bearing strains. In some inferior species the wood is spongy, contains less resinous matter, and presents a woolly surface after the saw. Swedish timber is often of this kind. Scotch fir is the most durable of the pine species. It was the opinion of the celebrated Mr. Brindley, "that red Riga deal, or pine wood, would endure as long as oak in all situations." Its lightness and stiffness render it superior to any other material for beams, girders, joists, rafters, etc. It is much used in joiners' work, as it is more easily wrought, stands better, is much cheaper, and is nearly, if not quite, as durable as oak. Scotch fir is exported from Norway and Sweden, under the name of *red-wood*. Norway exports no trees above eighteen inches diameter, consequently there is much sap-wood; but the heart-wood is both stronger and more durable than that of larger trees from other situations. Riga exports a considerable quantity under the name of masts and spars: pieces from eighteen to twenty-five inches diameter are called *masts*, and are usually seventy or eighty feet in length; those of less than eighteen inches diameter are called *spars*. Yellow deals and planks are imported from various parts of Norway, Sweden, Prussia, Russia, etc. Tar, pitch, and turpentine are obtained from the Scotch fir.—*See these titles*. When the tree has attained to a proper age it is not injured by the extraction of these products.

Spruce Pine.—Of this there are three species—the Norway spruce, or *Pinus abies*; white spruce, or *Pinus alba*; and black spruce, or *Pinus nigra*. These are noble trees, rising in straight stems from 150 to 200 feet in height. They yield the timber known by the name of *white fir*, or *deal*, from its always being imported in deals or planks. Deals imported from Christiana are in the highest estimation.—*See CHRISTIANA*. The trees are usually cut into three lengths, generally of about twelve feet each, and are afterward cut into deals by saw-mills, each length yielding three deals. The Norway spruce thrives very well in Britain, and produces timber little inferior to the foreign; it is somewhat softer, and the knots are extremely hard. The white spruce, or *Pinus alba*, is brought from British North America. The wood is not so resinous as the Norway spruce; it is tougher, lighter, and more liable to twist in drying. The black spruce, or *Pinus*

nigra, is also an American tree; but it is not much imported into England. The black and white spruce derive their names from the color of the bark, the wood of both being of the same color. The color of spruce fir, or white deal, is yellowish or brownish white; the hard part of the annual ring a darker shade of the same color. It often has a silky lustre, especially in the American and British grown kinds. Each annual ring consists of two parts; the one hard, the other softer. The knots are generally very hard. The clear and straight-grained kinds are often tough, but not very difficult to work, and stand extremely well when properly seasoned. White deal, as imported, shrinks about $\frac{1}{10}$ th part in becoming quite dry.

Weymouth Pine, or *White Pine* (*Pinus strobus*), is a native of North America. It is one of the largest and most useful of the American trees, and makes excellent masts; but it is not durable, nor fit for large timbers, being very subject to dry-rot. It has a peculiar odor.

The commercial value of pine is greater than that of any other wood, and it forms a large proportion of the lumber trade. The Northeastern States are supplied principally by Maine. The Middle States obtain their supplies from Michigan, New York, and Western Pennsylvania; the Northwestern States from Western Pennsylvania, Virginia, and Wisconsin.—*See LUMBER TRADE*.

Larch (*Pinus larix*). There are three species of this valuable tree—one European, and two American. The variety from the Italian Alps is the most esteemed, and has lately been extensively introduced into plantations in Great Britain. It is a straight and lofty tree, of rapid growth. A tree seventy-nine years of age was cut down at Blair Athol in 1817, which contained 252 cubic feet of timber; and one of eighty years of age, at Dunkeld, measured 300 cubic feet. The mean size of the trunk of the larch may be taken at 45 feet in length, and 33 inches diameter. The wood of the European larch is generally of a honey yellow color, the hard part of the annual rings of a redder cast; sometimes it is brownish white. In common with the other species of pine, each annual ring consists of a hard and a soft part. It generally has a silky lustre; its color is browner than that of the Scotch pine, and it is much tougher. It is more difficult to work than Riga or Memel timber, but the surface is better when once it is obtained. It bears driving bolts and nails better than any other species of resinous wood. When perfectly dry it stands well, but it warps much in seasoning. It is in all situations extremely durable. It is useful for every purpose of building, whether external or internal; it makes excellent ship timber, masts, boats, posts, rails, and furniture. It is peculiarly adapted for flooring boards, in situations where there is much wear, and for stair-cases; in the latter, its fine color, when rubbed with oil, is much preferable to that of the black oaken stair-cases to be seen in some old mansions. It is well adapted for doors, shutters, and the like; and, from the beautiful color of its wood when varnished, painting is not necessary.—(We have abstracted these particulars from Mr. TREDGOLD's excellent work, *The Principles of Carpentry*, p. 209-217.)

Pine-apple, or **Ananas**, though a tropical fruit, is now extensively cultivated in hot-houses and gardens, and is well known to every one. When of a good sort and healthy, it is the most luscious, and perhaps the best fruit that is produced; and, when carefully cultivated, is superior, in point of quality, to that produced in the West Indies.

Pink, a vessel masted and rigged like other ships, only that this is built with a round stern, the bends and ribs compassing so that her ribs bulge out very much. This renders the pinks difficult to be boarded, and also enables them to carry great burdens, for which purpose they are often used.

Pinnace, a small vessel used at sea, with a square stern, having sails and oars, and carrying three masts,

chiefly employed to obtain intelligence, and to land men, etc. One of the boats of a man-of-war, used to carry the officers to and from the shore, is also called the *pinnacle*.

Pint, a measure used chiefly in the measuring of liquids. The word is High Dutch, and signifies a little measure of wine. The English pint used to be of two sorts: the one for wine, the other for beer and ale. Two pints make a quart; two quarts a pottle; two pottles a gallon, etc. The pint, imperial liquid measure, contains 34·659 cubic inches.

Pipe, a wine measure, usually containing 105 (very nearly) imperial, or 126 wine gallons. Two pipes, or 210 imperial gallons, make a tun. But, in practice, the size of the pipe varies according to the description of wine it contains. Thus a pipe of port contains 138 wine gallons; of sherry, 130; of Lisbon and Bucellas, 140; of Madeira, 110; and of Vidonia, 120. The pipe of port, it is to be observed, is seldom accurately 138 gallons, and it is usual to charge what the vessel actually contains.

Pipe-clay, a species of clay abounding in Devonshire, and other parts of England, employed in the manufacture of various sorts of earthen-ware, and in bleaching.

Pipes, Amber (in Turkey). Prussia is almost the only country by which amber is furnished for ornamental purposes. M. Von Roy, an amber merchant, of Dantzig, is said to have been twenty-five years collecting the splendid specimens which he now possesses. The most extensive use of this elegant material is for the manufacture of the mouth-pieces of meerschau pipes and hookahs. Up to the present day amber mouth-pieces continue in great request in the East, where they fetch very high prices; and almost all the Prussian amber is sold to the Turks for manufacturing. There were in the Turkish department of the Exhibition four amber mouth-pieces for pipes, which were collectively worth £1000. It may serve in some measure to explain the peculiar favor which amber is held in by the Turks, that there is a current belief that amber is incapable of transmitting infection; it is deemed a mark of politeness to hand an amber pipe to a stranger.

Meerschau.—The clay of which these are made is procured chiefly in Asia Minor, but also in Spain, Greece, and Moravia. The manufacture of pipes from the clay is carried on with especial care at Vienna and Pesth. The meerschau is soaked in a liquefied composition of wax, oil, and fat, the absorption of which occasions the colors assumed by the pipe after smoking. Occasionally the bowls are artificially stained by dipping them in a solution of coppers and other substances before the application of the wax composition. The carving of the bowls is often difficult work, owing to the occurrence of a kind of clay mixed up with and harder than the meerschau. The large quantity of parings left in roughing out the bowls would entail considerable loss, unless some process had been devised for using them. This has been done; the parings are employed in making the kind of meerschau bowls called *massa-bowls*. The parings are ground to a fine powder, boiled in water, and moulded into blocks, with or without the addition of clay. The blocks are allowed to dry, and then a pipe-bowl is fashioned from each. These bowls are distinguished from the real meerschau chiefly by being rather heavier. Meerschau bowls have been produced so large and so elaborately carved as to be valued at five hundred dollars each.

Piracy consists in committing those acts of robbery and violence upon the seas that, if committed upon land, would amount to a felony. Pirates hold no commission or delegated authority from any sovereign or state, empowering them to attack others. They can, therefore, be only regarded in the light of robbers or assassins. They are, as Cicero has truly stated, the common enemies of all (*communes hostes omnium*); and the law of nations gives to every one the right to pursue and exterminate

them without any previous declaration of war; but it is not allowed to kill them without trial, except in battle. Those who surrender, or are taken prisoners, must be brought before the proper magistrates, and dealt with according to law. By the ancient common law of England, piracy, if committed by a *subject*, was held to be a species of treason, being contrary to his natural allegiance; and, by an *alien*, to be felony only; but since the statute of treasons (25 Edw. III. c. 2) it is held to be only felony in a subject. Formerly this offense was only cognizable by the admiralty courts, which proceed by the rules of the civil law; but it being inconsistent with the liberties of the nation that any man's life should be taken away unless by the judgment of his peers, the statute 28 Hen. VIII. c. 15, established a new jurisdiction for this purpose, which proceeds according to the course of common law. It was formerly a question whether the Algerines, and other African states, should be considered pirates; but, however exceptionable their conduct might have been on many occasions, and however hostile their policy might be to the interests of humanity, still, as they had been subjected to what may be called regular governments, and had been admitted to enter into treaties with other powers, they could not be treated as pirates. Pirates having no right to make conquests, or to seize upon what belongs to others, capture by them does not divest the owner of his property. At an early period of English history a law was made for the restitution of property taken by pirates, if found within the realm, whether belonging to strangers or Englishmen; but any foreigner suing upon this statute must prove that at the time of the capture his own sovereign and the sovereign of the captor were in mutual amity; for it is held that piracy can not be committed by the subjects of states at war with each other. Piracy was almost universally practiced in the Heroic Ages. Instead of being esteemed infamous, it was supposed to be honorable.—*Latrocinium maris gloriæ habebatur*.—JUSTINIAN, lib. xliii. Menelaus, in the Odyssey, does not hesitate to inform his guests, who admired his riches, that they were the fruit of his piratical expeditions (lib. iv. ver. 90); and such, indeed, was the way in which most of the Greek princes amassed great wealth.—GOSWELL, *Origin of Laws*. The prevalence of this piratical spirit in these early ages may, perhaps, be explained by the infinite number of small, independent states into which the country was divided, and the violent animosity constantly subsisting among them. In this way ferocious and predatory habits were universally diffused and kept alive; and it is not to be supposed that those who were at all times liable to be attacked by hosts of enemies should very accurately examine the grounds upon which they attacked others. According, however, as a more improved system of government grew up, Greece, and a few states, as Athens, Corinth, etc., had attained to distinction by their naval power, piracy was made a capital offense; but though repressed, it was never entirely put down. Cilicia was at all times the great strong-hold of the pirates of antiquity: and in consequence of the decline of the maritime forces of Athens, Rhodes, etc., which had kept them in check, they increased so much in numbers and audacity as to insult the majesty of Rome herself; so that it became necessary to send Pompey against them, with a large fleet and army, and more extensive powers than had been ever previously conferred on any Roman general.

During the anarchy of the Middle Ages, when every baron considered himself a sort of independent prince, entitled to make war on others, piracy was universally practiced. The famous Hanseatic League was formed chiefly for the purpose of protecting the ships of the confederated cities from the attacks of the pirates by which the Baltic was then infested. The nuisance was not finally abated in Europe till the feudal system had been subverted, and the ascendancy of the law every

where secured. In more modern times, some of the smaller West India islands have been the great resort of pirates; latterly, however, they have been driven from most of their haunts in that quarter. They are still not unfrequently met with in the Indian seas east of Sumatra.—M'CULLOCH'S *Com. Dict.*

Piracy is robbery, or a forcible depredation on the high seas, without lawful authority, and done *animo furandi*, and in the spirit and intention of universal hostility. It is the same offense at sea with robbery on land; and all the writers on the law of nations, and on the maritime law of Europe, agree in this definition of piracy. Pirates have been regarded by all civilized nations as the enemies of the human race, and the most atrocious violators of the universal law of society. They are every where pursued and punished with death; and the severity with which the law has animadverted upon this crime arises from its enormity and danger, the cruelty that accompanies it, the necessity of checking it, the difficulty of detection, and the facility with which robberies may be committed upon pacific traders in the solitudes of the ocean. Every nation has a right to attack and exterminate them without any declaration of war; for though pirates may form a loose and temporary association among themselves, and re-establish in some degree those laws of justice which they have violated with the rest of the world, yet they are not considered as a national body, or entitled to the laws of war, as one of the community of nations. They acquire no rights by conquest; and the law of nations, and the municipal law of every country, authorize the true owner to reclaim his property taken by pirates, wherever it can be found, and they do not recognize any title to be derived from an act of piracy. The principle that *a piratis et latronibus capta dominium non mutant*, is the received opinion of ancient civilians and modern writers on general jurisprudence, and the same doctrine was maintained in the English courts of common law prior to the great modern improvements made in the science of the law of nations.

By the Constitution of the United States, Congress is authorized to define and punish piracies and felonies committed on the high seas, and offenses against the law of nations. In pursuance of the authority it was declared, by the act of Congress of April 30, 1790, c. 9, sec. 8, that murder or robbery committed on the high seas, or in any river, harbor, or bay, out of the jurisdiction of any particular state, or any other offense, which, if committed within the body of a county, would, by the laws of the United States, be punishable with death, should be adjudged to be piracy or felony, and punishable with death. It was further declared, that if any captain or mariner should piratically or feloniously run away with any vessel, or any goods or merchandise to the value of fifty dollars, or should yield up any such vessel voluntarily to pirates; or if any seaman should forcibly endeavor to hinder his commander from defending the ship or goods committed to his trust, or should make a revolt in the ship, every such offender should be adjudged a pirate and felon, and be punishable with death. And by the act of March 3, 1819, c. 76, sec. 5, Congress declared, that if any such person on the high seas should commit the crime of *piracy as defined by the law of nations*, he should, on conviction, suffer death. This act was but temporary in its limitation, and has expired; but it was again declared, and essentially to the same effect, by the act of Congress, 15th of May, 1820, c. 113, sec. 3, that if any person upon the high seas, or in any open roadstead or bay or river, where the sea ebbs and flows, commits the crime of robbery, in or upon any vessel, or the lading thereof, or the crew, he shall be adjudged a pirate. So if any person, engaged in any piratical enterprise, or belonging to the crew of any piratical vessel, should land and commit robbery on shore, such an offender shall also be adjudged a pirate. The statute in this respect seems to be only declaratory of the

law of nations; and upon the doctrine of the case of *Lind v. Rodney*, such plunder and robbery ashore by the crew, and with the aid of vessels, is a marine case, and of admiralty jurisdiction. The statute further declared, that the above provision was not to be construed to deprive any particular State of its jurisdiction over such offenses when committed within the body of a county, or to authorize the courts of the United States to try any such offenders, after conviction or acquittal, for the same offense in a State court.

There can be no doubt of the right of Congress to pass laws punishing pirates, though they may be foreigners, and may have committed no particular offense against the United States. It is of no importance, for the purpose of giving jurisdiction, on whom or when a piratical act has been committed. A pirate, who is one by the law of nations, may be tried and punished in any country where he may be found, for he is reputed to be out of the protection of all laws and privileges. The statute of any government may declare an offense committed on board its own vessels to be piracy, and such offense will be punishable exclusively by the nation which passes the statute. But piracy, under the law of nations, is an offense against all nations, and punishable by all.—KENT'S *Commentaries*, vol. i.

Liability of Insurers.—There can be no piracy or robbery without violence; but this is not necessary to constitute the crime of theft. Piracy and robbery are most usually committed by strangers to the ship; they may, however, be committed by the crew; and the insurers are answerable for such a loss, unless it arise from the fault of the owner. If theft be committed by the crew, we should still hold the insurers liable. This may be doubtful; but insurers regard it as at least possible, and provide against it by the phrase, "assailing thieves." This excludes theft without violence, and perhaps all theft by those lawfully on board the vessel, as a part of the ship's company. If, after shipwreck, the property is stolen, the insurers are liable, and would probably be so if there were no insurance against theft, if this was a direct effect of the wrecking.—PARSONS'S *Mercantile Law*. The subjects of pirates and piracy have been discussed in the following works: NILES'S *Register*, xviii. 275, xxxii. 302, xx. 59, xxvii. 391, xxv. 157, xxvii. 138, xxxiii. 211; HUNT'S *Merchants' Magazine*, xiii. 450, 526, xiv. 89; *Edinburgh Review*, lxviii 33, xxvi. 449; LITTELL'S *Museum*, xxv. 337, xxvi. 266.

Pistachia, or Pistachio Nuts (Ger. *Pistaschen*; Du. *Pistasjes*; Fr. *Pistaches*; It. *Pistacchi*, *Fastucchi*; Sp. *Afscogicos*; Lat. *Pistacia*), the fruit of the *Pistachia vera*, a kind of turpentine-tree. It grows naturally in Arabia, Persia, and Syria; also in Sicily, whence the nuts are annually brought to us. They are oblong and pointed, about the size and shape of a filbert, including a kernel of a pale greenish color, covered with a yellowish or reddish skin. They have a pleasant, sweetish, unctuous taste, resembling that of sweet almonds; their principal difference from which consists in their having a greater degree of sweetness, accompanied with a light grateful flavor, and in being more oily. Pistachias imported from the East are superior to those raised in Europe.—LEWIS'S *Materia Med.*

Pistols. These are the smallest sort of fire-arms, carried sometimes on the saddle-bow, sometimes in a girdle round the waist, sometimes in the pocket, etc.—PARDON. The pistol was first used by the cavalry of England, in 1444.

The manufacture of guns and pistols in the United States has become an active one. Colt's Revolvers have acquired a reputation throughout Europe and South America, as well as the United States. His principal factory is located near Hartford, Connecticut. "It is so well ordered, so complete, so striking in its results, that all engaged in manufacture may learn something from it; it is in itself one large machine, well oiled too, which takes in at one end a shapeless

lump of iron, and a piece of wood, and puts out at the other a beautifully finished arm which you may load and fire six balls from separately in three-quarters of a minute, after a certain amount of practice. In each pistol there are fifty-three distinct pieces, including fourteen screws, and for the formation of these forty or forty-five separate machines co-operate, hammering, milling, cutting, drilling, punching, rifling, and shaving; all put into motion by a gallon of water 'in a violent perspiration;' in other words, a twenty-horse power steam-engine. Some of the machines are especially beautiful: look at that for rifling the barrels, for example, with the brush to keep the cutters clean; and the one near it for drilling the six chambers around the central boring in the solid cylinder, where accuracy is so indispensable. That regular irregularity, the eccentric, plays an important part in this, as it does in the hammering-machine below—the machine patented by Rider. In one week they turned out 525 perfect pistols here, and there are the means for making 800 or 900 a week, if it were necessary to do so."—*London Builder*.
